PEARS CYCLOPAEDIA

A BOOK OF BACKGROUND INFORMATION AND REFERENCE FOR EVERYDAY USE

EDITOR
L. MARY BARKER
B.Sc.Lond.

Seventy-seventh edition

First published 1897

Printed and Bound in Great Britain by Richard Clay (The Chaucer Press), Ltd.,
Bungay, Suffolk

Reprinted September . 1968

CONTENTS

INDEX

Some of the sections are alphabetically arranged and index themselves. Their contents are not included here except where it is anticipated some special difficulty in reference may arise. Each section has a letter and, where appropriate, the column is given in brackets after the page number, *e.g.*, F8(1), G26(2). The sections "Greek Myths and Legends", "Medical Matters" and "The World of Music" have each a separate index and glossary.

HISTORICAL EVENTS

CHRONICLE OF EVENTS

Note.—*For classical history and for the past millennium most dates are well established. For other periods there is sometimes considerable uncertainty. Many of the dates in ancient history are either dubious or approximate, sometimes both. For events in prehistory the reader may find it helpful to consult the Geological Time Scale and the sub-section Earliest Men in Part II of the Science Section.*

B.C. **PREHISTORY**

5,000,000,000 Age of Earth.

3,300,000,000 Earliest known rocks (found in Rhodesia and Manitoba).

2,000,000,000 Life appears.

600,000,000 First large-scale occurrence of fossils.

30,000,000 Earliest ape fossils (Oligocene period—Fayum, Egypt).

20,000,000 Early ape fossils (Miocene period—*Proconsul*, E. Africa).

1,700,000 Earliest known hominids (Lower Pleistocene—*Australopithecus*, and *Homo habilis* S. Africa, E. Africa.) Oldowan culture—first stage of Palaeolithic or Old Stone Age (hunting and food-gathering) which persisted until end of Ice Age, *c.* 8,000 B.C.

400,000 *Homo erectus* stage (Java, China, Africa) with crude chopping tools and early hand-axes. Heidelberg jaw (Europe).

250,000 Ancestors of Neandertalers and *Homo sapiens*, with advanced hand-axes (Europe: Steinheim and Swanscombe).

70,000 Neandertalers (Europe, Asia, N. Africa). Rhodesian Man (S. Africa). Solo Man (Java). Flake tools.

40,000 First cold phase ends. Neandertal race becoming extinct.

30,000 Second cold phase. *Homo sapiens* (modern man). Implements show significant advances: small knife-blades, engraving tools. Paintings and sculpture; magic rites and ceremonies. Cro-Magnons with Aurignacian culture.

18,000 Final culmination of last ice age. Aurignacian culture dying out to be replaced by Solutrean and then by the Magdalenian cultures. Great flowering of Palaeolithic art.

15,000 First immigrants from Asia to cross Behring Straits?

8,000 Last glaciers in Britain disappeared. Proto-Neolithic in Middle East. Agricultural settlements (*e.g.*, Jericho). Settled way of life leading eventually to such skills as weaving, metallurgy; inventions as ox-drawn plough, wheeled cart.

5,000 Britain becomes an island (land connection with continent severed by melting ice-sheets).

B.C. **CIVILISATION IN THE MIDDLE EAST**

4000 Susa founded.

3500 Sumerian civilisation flourishes. Cuneiform writing.

3000 First Egyptian Dynasty. Hieratic writing already perfected.

Early Minoan Age (Crete). Pictorial writing, copper, silver, gold in use. Early Mycenean civilisation begins.

2850 Memphis capital of Egypt.

B.C.

2870 First settlements at Troy.

2850 Golden Age of China begins (legendary).

2700 Great Pyramid age in Egypt begins.

2400 Aryan migrations.
Sargon founds Agade: Semitic empire.

2205 Hsia Dynasty begins in China (legendary).

2200 Middle Minoan Age: pottery, linear writing in pen and ink.

1900 Bronze Age begins in Britain.
Stonehenge (1860–1560 B.C.).

1760 Shang Dynasty begins in China (dated traditionally 1760–1122 B.C.).

1750 Aryan invasion of Mesopotamia.

1720 Hyksos conquest of Egypt. War chariots introduced.

1700 Code of Hammurabi at Babylon.

1600 Late Minoan Age: bronze in use.

1550 Sack of Babylon by Hittites.

1546 18th Dynasty in Egypt commences. Civilisation at peak (under Thotmes III, 1490). Chronology more certain.

1500 Powerful Mitanni (Aryan) kingdom in Asia Minor. Phoenicia thriving—trade with Egypt and Babylonia. Vedic literature in India.

1450 Zenith of Minoan civilisation.

1400 Ugarit (N. Syria) culture at its zenith. Cretan civilisation ends: Knossos burnt. Temple at Luxor built.

1377 Amenhotep IV (Ikhnaton), the "heretic" Pharaoh.

1350 Zenith of Hittite civilisation.

1300 Israelite oppression (Rameses II). Phoenician settlements—Hellas and Spain (Cadiz). Tyre flourishing.

1250 Assyrian conquest in Babylon: dominant in Western Asia.

1230 Exodus of Israelites from Egypt.

1200 Attacks on Egypt by "Peoples of the Sea". Downfall of Hittite kingdom. Siege of Troy (Homeric). Beginning of sea-power of independent Phoenician cities. Probably all these are connected with Achaean and other migrations in Aegean area.

1122 Chou Dynasty begins in China (870 years).

1115 Magnetic needle reputed in China.

1025 Establishment of kingship in Israel (Saul).

1000 Jerusalem capital of Israel. David king. *Rig Veda* (India).

961 Solomon begins temple at Jerusalem.

900 Probably period of writing of Homer's epics.

893 Assyrian chronological records begin.

850 Foundation of Carthage (traditional).

781 Chinese record of an eclipse.

776 First Olympiad to be used for chronological purposes.

753 Foundation of Rome (traditional).

750 Greek colonists settling in Southern Italy.

745 Accession of Tiglath-Pileser III: Assyrian Power at its height. Deportation of subject peoples (Israel 722).

683 Kingship abolished in Athens.

625 Neo-Babylonian (Chaldean) Empire (Nineveh destroyed 612).

B.C.
621 Publication of Athenian laws by Draco.
610 Spartan constitution, made rigid after Messenian Wars: later attributed to Lycurgus.
594 Athenian constitution reformed by Solon.
586 Jerusalem taken by Babylonians. Inhabitants exiled till 538.
561 Pisistratus tyrant of Athens.
560 Accession of Croesus—great prosperity of Lydia.
538 Babylon taken by Persians: Empire founded by Cyrus, soon covers almost all of civilised Middle East.
509 Foundation of Roman Republic (traditional).
508 Democratic constitution proclaimed in Athens.
500 Etruscans at height of their power in Northern Italy. Iron age beginning in Britain.

GREAT AGE OF GREECE

September 6 Disarmament discussions in London ended without agreement; 15 German general election (Dr. Adenauer re-elected Chancellor Oct. 22); 19 Bank Rate raised from 5 to 7 per cent.; 20 Death of Jean Sibelius, the Finnish composer; 30 Network Three introduced by B.B.C.

October 4 First earth satellite launched by Russia (180 lb. sphere, 23 in. diameter); 10 U.S.A. abolished fingerprinting for foreign visitors staying less than a year; 11 Largest radio tele-

A.D.

scope in world went into operation at Jodrell Bank for Manchester University; 14 The Queen opened Canadian Parliament in Ottawa; New road–rail double-decker bridge over Yangtse, one of largest in world, opened to traffic; 17 Endorsement of cheques no longer necessary save when negotiated.

November 3 Second earth satellite weighing half a ton launched into space by Russia with dog on board; 16 Russia announced construction of "scientific city" of 12 research institutes in Siberia; 20 Britain's first export order for nuclear power station for Northern Italy announced.

December 1 Latin 26-letter alphabet to be adopted in China; 4 Ninety people killed in railway accident in fog at Lewisham; 6 Attempt to launch earth satellite in the U.S.A. failed; *Sputnik I* completed its thousandth circuit of the Earth; 25 The Queen's Christmas broadcast televised for the first time; 31 The *Sputniks* were still circling the Earth, the first being expected to fall in the first days of January.

1958

January 1 Treaties establishing EEC (Common Market) and EAEC (Euratom) came into force; Metric system of weights and measures adopted throughout Japan; 3 Inauguration of West Indian Federation; Sir Edmund Hillary and New Zealand party reached South Pole; 4 *Sputnik I* disintegrated after completing 1,367 circuits of the Earth and travelling 43 million miles; 6 First non-stop flight across Antarctica by single-engine British aircraft (1,600 miles in 10 hr. 57 min.); Mr. Thorneycroft resigned from Government after disagreement in Cabinet over pruning Budget estimates; 7 Mr. Macmillan left for six-week tour of Commonwealth; 8 Summit talks proposed by Marshal Bulganin and Notes sent to 19 States; 13 Over 9,000 scientists from 44 countries petition UN Sec. Gen. to end nuclear weapons tests; 20 Dr. Vivian Fuchs, leader of Commonwealth expedition, reached South Pole; 24 Announcement that Harwell scientists working with ZETA had passed first milestone on road towards power from nuclear fusion; 28 Abolition of licensed prostitution in Italy; 31 First American earth satellite *Explorer I* (30·8 lb.) successfully launched.

February 1 Union of Egypt and Syria in the United Arab Republic; 5 Continuation of Antarctic research for at least 5 years after end of IGY announced; 8 French aircraft bombed Tunisian frontier village of Sakhiet; 14 Merger of Iraq and Jordan under name of Arab Federation; 19 Worst colliery disaster in Indian history in West Bengal; 25 Restoration plans for Stonehenge announced; Campaign for Nuclear Disarmament launched under presidency of Lord Russell.

March 2 IGY Commonwealth Trans-Antarctic Expedition, led by Dr. Vivian Fuchs, completed first crossing of Antarctic (2,200 miles in 99 days); 8 Federal union between UAR and Yemen established; 14 Birth of Prince Albert of Monaco; Small test satellite, *Beta 1958*, successfully launched by US Navy; 20 Bank rate reduced from 7 to 6 per cent; 21 Opening of London planetarium, the first of its kind in Britain; 26 Third US earth satellite, *Explorer III*, successfully launched; 27 M. Khrushchev elected Prime Minister in succession to M. Bulganin; 31 Russian resolution to suspend nuclear tests; other powers invited to follow suit.

April 1 Abolition of legalised prostitution in Japan; 4 Campaign for Nuclear Disarmament organised 50-mile protest march from London to Atomic Weapons Research Establishment at Aldermaston, Berkshire; 14 *Sputnik II* disintegrated over Caribbean, having completed 2,370 circuits of the Earth and travelled 62 million miles; 17 Nationalist Party of S. Africa returned with increased majority; Sir Grantley Adams elected first Prime Minister of the new West Indian Federation; 22 Princess Margaret opened the new Federal Parliament in Trinidad.

A.D.

May 1 Intense radiation belt in outer space discovered by US *Explorer* earth satellite; 10 Anti-government disturbances in Lebanon; 13 Military and colonist insurrection in Algeria; President of Italy paid state visit to Britain; 15 *Sputnik III* launched under IGY programme; New college to be built at Cambridge University (Churchill College); 22 Further reduction in Bank Rate to 5½ per cent.; 24 Nuclear reactor at Dounreay began working; 29 General de Gaulle accepted invitation to form a "Government of national safety."

June 1 General de Gaulle became Prime Minister of France; Clean Air Act banning emission of dark smoke came into force; 9 Gatwick Airport opened by the Queen; 19 Further cut in Bank Rate from 5½ to 5 per cent.; New British plan for Cyprus announced; 20 London bus strike ended after 7 weeks; 21 Greek Government rejected British plan for Cyprus; 23 Ghana to be declared a republic.

July 1 Conference of scientists, including Russian delegation, met at Geneva to discuss ways of detecting nuclear tests; 14 Iraq monarchy overthrown, King Faisal assassinated; establishment of Republic announced; 15 US marines landed in Lebanon; 17 British troops flown to Amman in response to King Hussein's appeal; 24 First life barons and baronesses under Life Peerages Act named; 26 H.M. the Queen created her son, Charles, Prince of Wales; 31 British Prime Minister sent appeal to all Cypriots to end violence.

August 1 British Government recognised Republic of Iraq; 5 U.S. nuclear submarine *Nautilus* surfaced after having passed under North Pole; 7 Litter Act came into force in Britain; 14 Bank Rate reduced from 5 to 4½ per cent.; 17 First attempt by America to launch moon rocket failed; Britain to resume nuclear tests on Christmas Island; 23 Bombardment by Chinese of Quemoy (Formosa Strait); 29 More American warships join Seventh Fleet in Formosa Strait.

September 1 International conference on peaceful uses of atomic energy opened in Geneva; 7 Britain successfully fired its first ballistic rocket (Black Knight) from Woomera; 15 Ambassadors of America and China met in Warsaw for discussions on Formosa crisis; 16 Relaxations in hire-purchase; 29 Referendum resulted in overwhelming victory for General de Gaulle; Lord Goddard retired as Lord Chief Justice; succeeded by Lord Justice Parker; Gen. Sir Francis Festing succeeded Field-Marshal Sir Gerald Templer as Chief of the Imperial General Staff.

October 1 India began change to metric system; 2 French Guinea proclaimed Republic of Guinea after overwhelming vote for independence in French referendum; 8 Martial law in Pakistan; 9 Death of Pope Pius XII at age of 82; 11 The London weeklies *John Bull* and *Illustrated* merged; US *Pioneer* space-rocket successfully launched (but failed to reach moon); 21 First women peers introduced to House of Lords; 28 State opening of Parliament and Queen's Speech televised; Cardinal Roncalli, Patriarch of Venice, elected as Pope John XXIII at age of 76; 31 Conference opened in Geneva (Russia, Britain, and the United States) on suspension of nuclear tests.

November 20 Bank Rate reduced from 4½ to 4 per cent.; 21 Work started on Forth road bridge, the largest suspension bridge in Europe; 27 Russian plan for withdrawal of troops and demilitarised free Berlin.

December 8 Last of four nuclear reactors at Calder Hall brought into operation; 17 Chinese leader, Mao Tse-tung, to resign as chairman of Republic but to retain party office; 18 US 4-ton missile fired into orbit; Empire Day to be known in future as Commonwealth Day; 21 General de Gaulle elected President of France; 27 Partial convertibility between £ and $ announced; UAR and Russia signed agreement on Russian co-operation in Aswan high dam project; 28 General de Gaulle announced devaluation of the franc; 31 IGY officially came to an end.

A.D.

1959

January 1 Batista Government in Cuba overthrown by revolutionary movement under Dr. Fidel Castro; 2 Russia launched planet round the sun (*Lunik I*); 3 Alaska became 49th state of American Union; 4 Mr. Mikoyan, Soviet Dep. Prime Min., arrived in Washington on 16-day visit; Rioting in Leopoldville; 7 Britain recognised new Cuban Government; 8 Gen. de Gaulle installed as first Pres. of Fifth French Republic; 10 Russian proposal for conference of 28 nations to draw up German Peace Treaty; 25 Oecumenical Council, the first since 1870, convened by Pope John XXIII.

February 1 Votes for women rejected by Swiss national poll; 9 New research reactor to be built at Windscale, Cumberland; 11 M. Vincent Auriol resigned from French Socialist Party; 21 Mr. Macmillan arrived in Moscow on official visit; 23 Archbishop Makarios returned to Cyprus after 3-year exile; Cyprus to become a republic with Greek Pres. and Turkish Vice-Pres.; 26 State of emergency declared in Southern Rhodesia; 27 Riots in Malta dockyard due to dismissal of workers.

March 3 American *Pioneer IV* went into planetary orbit round sun; State of emergency declared in Nyasaland; British scientists isolated basic molecule of penicillin; 17 Uprising in Lhasa against Chinese rule; Flight of Dalai Lama to India; 24 Iraq withdrew from Baghdad Pact.

April 5 Panchen Lama arrived in Lhasa to take over local government of Tibet; 8 Chair of Criminology founded at Cambridge; 14–16 Worst flood disaster of century in S. America; 23 British heart specialists in Moscow to demonstrate heart surgery; 27 Liu Shao-ch'i succeeded Mao Tse-tung as Chairman (President) of Chinese People's Republic.

May 1 Opening of Rajendra Bridge (6,074 ft.) over Ganges at Hathidah (Bihar); 2 First Scottish nuclear power-station opened at Chapelcross; 15 Jodrell Bank radioed message to United States via moon; 28 Opening of Mermaid Theatre in City of London; 30 Auckland Harbour Bridge officially opened; 31 World's population (2,800 millions) increasing at rate of 45 millions a year.

June 8 U.S. Post Office made first successful delivery of mail by guided missile; 17 Mr. de Valera elected Pres. of Rep. of Ireland; Serious riots in African townships in Durban; 18 Five-year plan for Scottish Highlands announced; 24 World record price (£275,000) paid at Sotheby's for Rubens' *The Adoration of the Magi*; 26 St. Lawrence Seaway formallyopened by the Queen and Pres. Eisenhower; 29 Norwegian Halden nuclear reactor in operation;

July 3 Italy to build nuclear submarine *Guglielmo Marconi*; Tancarville road bridge near Le Havre, longest suspension bridge in Europe, opened; 4 Transatlantic record flight set up by Vickers *Vanguard* turbo-prop airliner (2,500 m. in 5¼ hrs.); 5 Recovery in good condition of 3 animals from outer space; 7 Litter Act passed making it an offence to drop litter (fine up to £10); 21 Launching of first nuclear merchant ship *Savannah* by Mrs. Eisenhower; 28 £100 tax-free annuity for V.C. holders.

August 16 The Street Offences Act came into force; 21 Baghdad Pact renamed Central Treaty Organisation; 22 First round-the-world service by British airliners inaugurated; 23 Announcement of plan for oil-pipeline network between Soviet Union and East European countries (completion 1963).

September 11 British loan made available for Malta dockyard. 13 Russia launched *Lunik II* which landed on moon; 15 Soviet atomic icebreaker *Lenin* made maiden voyage into Baltic; 25 Mr. Bandaranaike, Prime Min. of Ceylon, assassinated; 27 Typhoon in W. Japan (5,000 killed and missing, 1,000,000 homeless).

October 4 Russia fired *Lunik III*, which took photographs of back of moon; 8 General Election returned Conservatives with 100 overall majority; 10 End of one of longest droughts ever recorded in Britain; 24 Opening of new airport for Wellington, N.Z.; 29 Dublin's famous Abbey Theatre to be rebuilt (destroyed by fire 1951).

November 1 Basic travel allowance for British tourists ended (foreign currency up to £250 a year and further amounts on application to Bank of England); 2 First section of London-Yorkshire motorway (M1) opened to traffic; 5 Philip Noel-Baker awarded Nobel Peace Prize; 8 Sudan and U.A.R. signed agreement on distribution of Nile waters; 17 Announcement of discovery by American scientists of submarine plateau in Arctic Ocean; 19 Bank of England announced introduction of new series of bank notes (10s., £1, £5, £10); 14 Dounreay fast breeder reactor went into operation; 21 British book exhibition opened in Moscow; 24 CERN's proton synchrotron at Geneva went into full operation generating 24,000 million electron volts (24 GeV.); 27 Duke of Edinburgh opened Ghana's Academy of Learning in Accra; 28 Naval dockyard at Hong Kong closed after 80 years; 30 Inauguration of Italy's first nuclear research reactor; Pink Zone traffic plan went into operation in London.

December 1 Anglo-Russian cultural agreement signed in London; 12-power treaty on Antarctica signed in Washington; State of emergency in Cyprus ended; Bursting of dam at Fréjus killed 384 people; Pres. Eisenhower began tour of Europe, Asia, and Middle East; 5 Opening of 400-mile Sahara pipeline by French Prime Minister; 6 Inauguration of Panchet Hill Dam on Damodar R., Bihar; 10 Raising of school-leaving age to 16 recommended by Crowther Report; 14 Archbishop Makarios elected first Pres. of Cyprus; 15 New world speed record of 1,520 m.p.h. set up by U.S. Air Force pilot; 21 Marriage of Shah of Persia to Miss Farah Diba; 26 Soviet Antarctic expedition reached South Pole; 28 Jugoslavia's first nuclear reactor went into operation; Tokyo reported that in 1959 38 people died in hospital from 1945 Hiroshima atomic bomb attack.

1960

January 1 Republic of Cameroun (formerly French Cameroons) became independent state. 4 Albert Camus, French writer, killed in car crash. 7 Hirfanli Dam in Turkey opened, largest in Europe. 9 Work begun on Aswan High Dam. 12 State of emergency ended in Kenya after 8 years; 13 Mr. Aleksander Soldatov appointed to succeed Mr. J. Malik as Soviet Ambassador to Britain. 21 Bank rate increased to 5%. 23 M. Jacques Piccard and an American naval officer descended 7 miles under Pacific in Marianas Trench. 24 Army rising in Algeria. 29 Broadcast of Pres. de Gaulle to nation contributed to collapse of military revolt.

February 3 Mr. Macmillan addressed S. African Parliament (famous " wind of change " speech). 4 Announcement that American university had made radar contact with Sun. 13 First French atomic test in Sahara. 17 British agreement to U.S. ballistic missile early-warning system at Fylingdales Moor, Yorkshire. 19 Prince Andrew born. 29 Agadir destroyed by earthquake.

March 17 New £1 notes issued in Britain. 18 Last steam locomotive of British Railways named. 21 Sharpeville shooting in S. Africa when police fired on African gathering. 23 Mr. Khrushchev in Paris. 30 State of emergency in S. Africa.

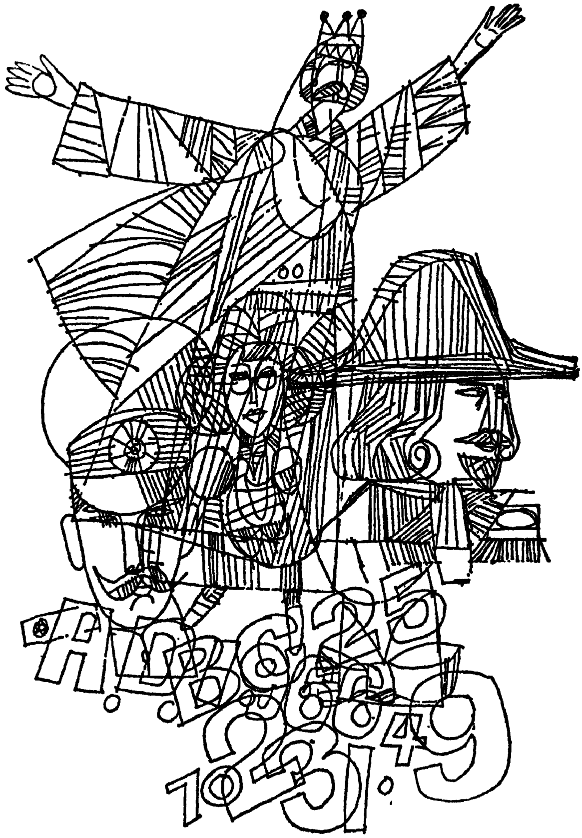
Party won 12 seats in state parliament of Baden-Württemberg. 30 Nelson Rockefeller announced his candidacy for nomination by Republican Party for the presidency.

... N. Vietnam proposal to meet in Paris on 10 May for preliminary talks; First British heart transplant operation at London's National Heart Hospital.

PROMINENT PEOPLE



PROMINENT PEOPLE

Abbot, George (1562–1633), Archbishop of Canterbury in 1611, and one of the translators of the authorised version of the Bible.

Abdullah ibn Husein (1882–1951); King of Jordan; made ruler under the British mandate in 1921 and proclaimed King in 1946 when Transjordan (renamed Hashimite Kingdom of the Jordan in 1949) was created an independent state by treaty with Britain. Assassinated.

Abelard, Peter (1079–1142), one of the most influential thinkers of the mediaeval world, b. near Nantes, pupil of Roscelin and William of Champeaux. Living in age of great theological controversy he applied his creative and versatile mind to the problem of Christian faith and held that goodness depends upon intention and free choice. Unrivalled as a dialectician, he acquired great popularity as a teacher and attained great scholastic glory. His romance with Heloise, niece of Canon Fulbert, has been much written about. The Canon had Abelard castrated and they retired from the world, he to the monastery at St. Denis and she to a nunnery at Argenteuil. Their bodies lie in one tomb at Père la Chaise.

Abercrombie, Lascelles (1881–1938), English poet and critic. Professor of English Literature at London University, 1929–35; Lecturer in Poetry at Queen's University, Belfast, 1931–32.

Abercrombie, Sir (Leslie) Patrick, M.A., F.S.A. F.R.I.B.A. (1879–1957), architect and town-planner. Brother of the above. Lever Prof. of Civic Design at Liverpool, 1915–35; Prof. of Town Planning at University College, London, 1935–46. Consulted on the replanning of Plymouth, Hull, Bath, the Clyde Valley, Dublin, Addis Ababa, Colombo, and Cyprus. Produced the famous plan for Greater London, 1943.

Acheson, Dean Gooderham, A.B., LL.B. (b. 1893), U.S. Secretary of State in the Truman Administration, 1949–52. Appointed 1961 to advise Sec. of State Dean Rusk on American policy in regard to Nato.

Acton, John Emerich Edward Dalberg, 1st Baron, K.C.V.O., D.C.L., LL.D. (1834–1902), English historian and brilliant scholar; Professor of Modern History at Cambridge, 1895–1902.

Adam, Robert (1728–1792), one of four Scottish brothers, all distinguished architects. Developed a characteristic style in planning and decoration and designed many important public and private buildings and interiors. His achievements include the great aristocratic houses of Harewood, Yorks; Osterley, Middlesex; Syon, Middlesex; Kedleston, Derbyshire.

Adams, John (1735–1826), succeeded Washington as President of the United States, and was the first of the Republic's ambassadors to England.

Adams, John Couch, F.R.S. (1819–92), English mathematician and astronomer. Shared credit for discovery of the planet Neptune, 1846, with the French astronomer, Leverrier (1811–77).

Adams, Samuel (1722–1803), American statesman, known as the "American Cato," who worked all his life for American Independence and signed the Declaration (1776). He organised the "Boston Tea Party."

Adams, William (*c.* 1564–1620), first Englishman to visit Japan; b. Gillingham, Kent. His knowledge of shipbuilding, navigation and European affairs proved of great value to the Japanese emperor Ieyasu at a time when he was interested in developing foreign trade.

Addams, Jane, B.A., M.A (1860–1935), famous American sociologist who founded Hull House, Chicago, in 1889.

Addison, Christopher, 1st Viscount, K.G. P.C. M.D., F.R.C.S. (1869–1951). After joining the Labour Party held successive Ministerial offices in 3 Labour Governments and became leader of the House of Lords. Forsook his profession as professor of anatomy at Sheffield Univ. for a political career because of his great interest in public health and social reform.

Addison, Joseph (1672–1719), achieved fame both as a writer and a politician. Held many offices under various governments; contributed to the *Tatler* started by his friend Steele and with him founded the *Spectator*.

Adenauer, Dr. Konrad (1876–1967), Chancellor of the West German Federal Republic, 1949–63. Founder and Chairman of the Christian Democratic Party, 1945–66. To a defeated Germany he gave stable constitutional government, a place in the Western alliance, and provided strong, consistent leadership. He brought about reconciliation with France but resisted all attempts at accommodation with Russia. *See also* Section C, Part I.

Adler, Alfred (1870–1937), Austrian physician and psychiatrist and founder of the school of individual psychology. An earlier pupil of Freud, he broke away in 1911, rejecting the emphasis on sex, and regarding man's main problem as a struggle for power to compensate for feelings of inferiority. (*See* Section J.)

Adrian IV, Nicholas Breakspear (d. 1159), pope (1154–59), the only English pope, b. near St. Albans. Crowned Frederick Barbarossa as German emperor. Granted overlordship of Ireland to Henry II which started a dispute which raged for 800 years.

Adrian, Edgar Douglas, 1st Baron, O.M., M.A., M.D., F.R.S., F.R.C.P. (b. 1889), Prof. of Physiology, Cambridge Univ. 1937–51; Master of Trinity Coll., Cambridge, 1951–65, Pres. of the Royal Society 1950–55; Pres. of the British Association, 1954. Trustee of Rockefeller Institute, 1962. Chanc. Leicester Univ., 1957, Cambridge Univ., 1967. Nobel Prize for Medicine, 1932.

Æschylus (525–456 B.C.), father of Greek tragic drama. Composed seventy plays and gained the prize for dramatic excellence thirteen times.

Æsop, name famous for the fables preserved principally through Babrius (2nd century A.D.). About him nothing is known; according to legend he was a Greek slave in the 6th century B.C. who had a number of wild adventures.

Agassiz, (Jean) Louis (Rodolphe) (1807–73), Swiss-American zoologist and geologist. Author of *Researches on Fossil Fishes* (1833–43), and *Studies on Glaciers* (1840). He was an opponent of Darwin.

Agricola, Gnaeus Julius (A.D. 37–93), became Roman Consul of Britain A.D. 78. Strengthened the power of the Romans in this country, corrected many abuses, and did much to encourage trade and industry. Remained in Britain 7 years.

Agrippa, Marcus Vipsanius (63–12 B.C.), the greatest military commander of Rome after Julius Cæsar.

Ahmad Khan, Sir Syed (1817–98), great Indian educationist and social reformer who founded what is now the Aligarh Muslim University.

Aird, Sir John, Bart. (1833–1911), contracting engineer of eminence, associated with many great undertakings in different parts of the world, the Aswan Dam on the Nile, completed in 1902, being one of his achievements.

Airy, Sir George Biddell, K.C.B., F.R.S. (1801–1892), Astronomer Royal (1835–1881) at Greenwich Observatory, where his brilliance and industry led to many important researches.

Akbar, Jalal-ud-din Mohammed (1542–1605), the greatest and wisest of the Mogul emperors and one of the great figures of history. He initiated economic and social reforms and succeeded in unifying his vast empire. His courts at Delhi and Agra were centres of culture and learning.

Alanbrooke, Field-Marshal Viscount, K.G., G.C.B.,

O.M., G.C.V.O., D.S.O. (1883–1963), one of the greatest soldiers of modern times; Chief of Imperial General Staff, 1941–46. Sir Arthur Bryant's *The Turn of the Tide* (1957), and *Triumph in the West* (1959), are based on the war diaries of Lord Alanbrooke.

Alaric I (376–410), the famous chief who after the death of Theodosus I led the Visigoths against the Romans, and afterwards invaded both Greece and Italy. He took Rome in 410, and died soon afterwards. It is said that he was buried with a vast treasure in the bed of the River Busento, and so that the Romans might not discover his remains, the slaves who buried him were put to death.

Alban, St., who flourished in the latter part of the 3rd century, was born at Verulamium (where St. Albans now stands) and served as a soldier under Diocletian at Rome. Later he was converted to Christianity, and was for a time a renowned preacher of that religion, finally suffering martyrdom. Offa, king of the Mercians, built a monastery to his memory near Verulamium, four or five hundred years later. St. Alban's Day: Roman Catholic Church, June 22nd; Anglican Church, June 17th.

Albani, Madame (1852–1930), stage name of Marie Louise Emma Lajeunesse, Canadian operatic soprano. Made her first appearance in England at Covent Garden in 1872 and was for many years a leading prima donna, achieving great celebrity as Elsa in *Lohengrin*.

Albert, Prince Francis Augustus Charles Emmanuel, Consort of Queen Victoria (1819–1861). On his marriage with the Queen in 1840 Parliament granted him an income of £30,000 a year. The prince adapted himself with considerable success to the difficulties of his position, and gradually secured the confidence and esteem of statesmen and public alike. The great Exhibition of 1851 owed much of its success to his efforts. He died of typhoid fever in December, 1861. The Albert Memorial forms a national tribute to his memory.

Albertus Magnus, St. (1206–80), Dominican scholastic philosopher, b. Bavaria, one of the great mediaeval university teachers and the most learned man of his time. St. Thomas Aquinas was his favourite pupil. Took scientific interest in nature and made notable botanical observations.

Alcibiades (c. 450–404 B.C.), treacherously killed in battle at Melissa, Phrygia, was the celebrated Athenian statesman and general, pupil and friend of Socrates.

Alcock, Sir Walter Galpin, M.V.O., Mus. Doc., F.R.C.O. (1861–1947), English musician, eminent both as organist and composer of church music. He played at the Coronations of King Edward VII, King George V and King George VI. Organist to Salisbury Cathedral, 1916–47, and Professor of Organ at Royal College of Music, 1893–1939.

Alcott, Louisa May (1832–88), American authoress; the charm and naturalness of her writings made her a favourite among children's authors, and her books are still read on both sides of the Atlantic. Her most famous book, *Little Women*, appeared in 1868.

Alcuin (735–804), scholar and ecclesiastic, a leader of the Carolingian Renaissance. His works include poems and historical and theological writings. (*See also* J30(1)).

Aldred (d. 1069), a powerful ecclesiastic of the 11th century in great favour with the Conqueror, whom he crowned. Bishop of Worcester (1044–60), and Archbishop of York (1060–1069).

Alekhine, Dr. (Aljechin) Alexander (1892–1946), world chess champion, 1927–35, 1937–46.

Alembert, Jean le Rond d' (1717–1783), a Parisian mathematician and philosopher who achieved great eminence by his numerous scientific works, including the *Theory of the Winds* and the *Precession of the Equinoxes*.

Alexander of Hillsborough, Earl, K.G., P.C., C.H. (1885–1965). Leader of the Labour peers in House of Lords, 1955–65; Min. of Defence, 1946–50; First Lord of the Admiralty, 1929–31 1940–45, 1945–56.

Alexander of Tunis, Field-Marshal Earl, P.C., K.G., G.C.B., O.M., G.C.M.G., D.S.O. (b. 1891). Comm. 1st Div. at Dunkirk; C.-in-C. Southern Command, 1940–42; G.O.C. in Burma, 1942, when he conducted a masterly retreat: C.-in-C. Middle East, 1942–43, when he was largely responsible for driving the enemy out of North Africa; C.-in-C. Allied Armies in Italy, 1944; and Supreme Allied Commander, Mediterranean, 1944–45, when he successfully led a force drawn from many different nations. Gov.-Gen. of Canada, 1946–52; Min. of Defence, 1952–54.

Alexander II. of Russia (1818–1881), succeeded his father, the Emperor Nicholas, in 1855. In 1861 he emancipated 23 millions of serfs. On March 13, 1881, was assassinated by bombs thrown beneath his carriage in St. Petersburg by Nihilists.

Alexander the Great (356–323 B.C.). King of Macedon, succeeded his father Philip in 336 B.C., and from the first showed himself fitted for mighty military exploits. He conquered in turn the Thebans, the Persian Satraps, overthrew Darius, overran Syria and Phoenicia, possessed himself of all the cities along the Mediterranean, conquered Egypt, founded Alexandria, and finally retired upon Babylon, where he died eleven days later.

Alexandra, Queen (1844–1925), d. of Christian IX. of Denmark, married to the Prince of Wales (afterwards Edward VII.) on March 10, 1863. Queen from Jan. 22, 1901, to May 6, 1910.

Alfieri, Count Vittorio (1749–1803), the Italian poet, was the author of twenty-one tragedies and six comedies.

Alfonso the Wise (1221–1284), a celebrated King of León and Castile, founder of the legal code which became the basis of Spanish jurisprudence, a liberal patron of literature and science, particularly of astronomy; dethroned by his son Sancho in 1282.

Alfred the Great (849–99), king of Wessex, son of Aethelwulf; succeeded his brother as king in 871 and found himself in conflict with the Danes from the outset. After years of effort he won decisive battle of Ethandum (Edington), 878. He prepared for further attacks by the Danes by building ships, fortifications, and by reorganising the militia or *fyrd*, defensive measures which eventually withstood the invading forces. Besides being a great warrior, a very able legislator and administrator, he was also a man of letters and responsible in great measure for the revival of English scholarship.

Allenby, Field-Marshal Viscount, G C.B., G.C.M.G., G.C.V.O. (1861–1936), brilliant cavalry soldier. Served on Western front, 1914–16; commanded in Palestine, 1917–18, capturing Jerusalem on December 9th, 1917. High Commissioner for Egypt, 1919–25.

Alleyne, Edward (1566–1626), a famous actor, contemporary of Shakespeare and founder of Dulwich College.

Alma-Tadema, Sir Lawrence, O.M., R.A. (1836–1912), the son of a Netherlands notary, he came to England in 1869, where he soon made a name for himself as a painter of classical pictures of great beauty of colour and delicate design.

Ampère, André Marie (1775–1836), French mathematician who devoted himself to the study of electricity and magnetism, and was the first to propound the electro-dynamic theory.

Amundsen, Captain Roald (1872–1928). Norwegian explorer, the first to navigate the North-west Passage and the first to reach the South Pole. Sailing in the fishing smack *Gjöa*, he negotiated the North-west Passage in the 3 years, 1903–6. In 1911 he sailed south in the *Fram* and reached the Pole on December 14th, 1911, a month before his English rival Scott. He failed to complete a flight across the North Pole in 1925, but succeeded the next year. He lost his life in the Arctic while attempting to rescue Nobile, who had crashed in the *Italia*.

Anacreon (c. 560–475 B.C.), the celebrated Greek poet whose Odes hold a high place in poetic literature.

Anaxagoras (488–428 B.C.), Greek philosopher of Ionia who came to Athens 464 B.C. He inspired Pericles and the poet Euripides with his great love of science, and is said to have been the teacher of Socrates, who, however, differed from him. His rational theories outraged religious opinion and he retired to his native Asia Minor.

Anaximander (611–547 B.C.), Greek philosopher of Miletus in Asia Minor, pupil of Thales. He was the first among the Greeks to make geographical

maps, and to speculate on the origin of the heavenly bodies; he introduced the sun-dial from Babylon or Egypt.

Anaximenes (b. *c.* 570 B.C.), the last of the Milesian school founded by Thales. For him the primal substance was air and he was the first to see the differences between substances in quantitative terms.

Andersen, Hans Christian (1805–1875), perhaps the most gifted writer of fairy tales the world has known. *Mit Livs Eventyr* (The Story of My Life) is as interesting as his fairy tales, which include *The Ugly Duckling*, *The Little Mermaid*, *The Emperor's New Clothes*, *The Little Match-seller*. Born and died in Denmark.

Anderson, Elizabeth Garrett, M.D. (1836–1917), one of the first English women to enter the medical profession. Practised in London for many years. In 1908–9 was Mayor of Aldeburgh, her native town, the first woman to be a mayor.

Andrea del Sarto (1487–1531). This celebrated son of a Florentine tailor was one of the great Italian artists of his time, known as the "faultless painter." Most of the famous galleries of the world contain examples of his magnificent fresco and other painting, mainly dealing with religious subjects.

Andrée, Salomon August (1854–1897), a Swedish explorer who attempted in 1897 to reach the North Pole by balloon, but, except for a message by pigeon despatched two days after his ascent, was not heard of again until in August 1930 a Norwegian scientific expedition led by Dr. Gunnar Horn discovered the remains of the Andrée expedition on White Island. The discovery included a log-book, sketch maps and the diaries kept by Andrée.

Andrew, Saint, one of the apostles of Jesus, brother of Simon Peter, whose festival is observed on November 30th. He became the patron saint of Scotland in the eighth century.

Angelico, Fra (1387–1455). Italian painter of religious subjects, mostly in the form of frescoes, of which the best examples are at Florence.

Angell, Sir Norman (1872–1967), political commentator, author of *The Great Illusion* (1910), in which he argued that war could no longer pay, and *The Money Game* 1918. Nobel Prize for Peace, 1933

Ångström, Anders Jöns (1814–74), Swedish physicist, whose life was devoted to the study of heat, magnetism and spectroscopy, and in all three he contributed greatly to scientific knowledge. The unit used for measuring the wavelength of light was named *Angstrom* in his honour.

Anne, Queen (1665–1714), Queen of Great Britain and Ireland from 1702 to the time of her death, was a daughter of James II., and succeeded William III., her cousin. During her reign England, in alliance with Austria, Holland, Prussia, Savoy, and Portugal, entered upon the War of the Spanish Succession. Anne's reign has been called the Augustan Age of Britain because of the many eminent men of letters who flourished during that period. She was the last of the Stuarts to occupy the British throne. The most important domestic event of her reign was the passing of the Act of Union with Scotland in 1707.

Anouilh, Jean (b. 1910), French playwright, several of whose plays have been translated into English, including *Roméo et Jeannette* (Fading Mansion), *Eurydice* (Point of Departure), *L'Invitation au Château* (Ring Round the Moon), and he has made a number of films. (*See also* Section I.)

Anselm St. (1033–1109), Archbishop of Canterbury, was a native of Aosta, and succeeded Lanfranc as English Primate. He was in serious conflict with William Rufus on the question of ecclesiastical rights, and for a time suffered exile. Under Henry I., he regained power, making a compromise with that monarch which enabled him to carry on his theological work in comparative harmony. He died at Canterbury, and was canonised in 1494, his day being celebrated in the Roman Church on April 21st.

Anson, George, 1st Baron (1697–1762), a navigator of great eminence, whose *Voyage round the World* is still a popular book of adventure. He won many victories, obtained a peerage, rose to full Admiral's rank in the Navy, and served two terms as First Lord of the Admiralty.

Antoninus Pius (86–161). Emperor of Rome from A.D. 138 to 161, the successor of Hadrian. He governed with ability and his reign brought peace and prosperity to the empire. It was during his reign that the wall between the Forth and Clyde was built.

Antonius Marcus or Mark Antony (*c.* 83–30 B.C.), celebrated Roman Triumvir and General; a warm supporter of Cæsar; but engaged in intrigues after the latter's death, and was opposed by Brutus and Cassius. His association with the Egyptian Queen Cleopatra is the subject of Shakespeare's play. Committed suicide after defeat by Octavian.

Antony, St. (or Anthony) (*c.* 251–356), was a native of Upper Egypt, and according to his own account spent much time in conflict with the devil. He is one of the best-known saints of the Roman calendar, and his festival is on January 17th. He was believed to give relief to those who appealed to him when suffering from erysipelas, from which tradition the name St. Anthony's Fire is given to the disease.

Apelles, Greek painter, the most celebrated of antiquity, who flourished in the 4th century B.C. at the time of Alexander the Great. His most famous pictures, which have not survived, are of Alexander wielding the thunderbolts of Zeus and of Aphrodite rising from the sea.

Apollinaire, Guillaume (Wilhelm Apollinaris Kostrowitzi) (1880–1918), French poet representative of the restless and experimental period in the arts before the First World War. He invented the term *surrealism*. Born in Rome of Polish extraction.

Appert, Nicholas (1752–1841), sometimes known as François Appert, invented the method of preserving animal and vegetable foods by means of hermetically sealed cans or tins. He had no scientific training, but his painstaking work and countless experiments bore the mark of a true scientist. His revolutionary methods paved the way for the creation of a vast world industry which cans millions of tons of food a year.

Appleton, Sir Edward Victor, G.B.E., K.C.B., D.Sc., F.R.S. (1892–1965), English physicist; worked under Rutherford at Cavendish Lab. (1920–24); Prof. of Physics, London Univ. (1924–36), Prof. of Natural Philosophy at Cambridge (1936–39), Sec. of D.S.I.R. (1939–49). Best known as the discoverer of the ionised region of the upper atmosphere which became known as the Appleton Layer. His researches led to the development of radar. Nobel Prize for Physics, 1947; Pres. Brit. Ass., 1953.

Apollonius of Perga (fl. 220 B.C.), Greek mathematician of the Alexandrian school, remembered for his conic sections; introduced the terms *ellipse*, *parabola*, and *hyperbola*.

Apollonius Rhodius (fl. 250 B.C.), scholar and poet of Alexandria and Rhodes, librarian at Alexandria. He wrote on the text of Homer and is remembered for his epic *Argonautica* about the Argonaut heroes.

Aquinas, Thomas, Saint (*c.* 1225–74), chief scholastic philosopher whose system was ruled by Leo XIII in 1879 to be the official Catholic philosophy. He was greatly influenced by Aristotle. The most important of his works are *Summa contra Gentiles* and *Summa theologica*.

Arago, Dominique François Jean (1786–1853), French astronomer and physicist, remembered for his discoveries in electromagnetism and optics.

Archimedes (287–212 B.C.), Greek mathematician, physicist, and inventor, to whom we are indebted for his discoveries in mechanics (notably the lever), hydrostatics (floating bodies), and for the invention of the famous Archimedean screw. He lived most of his life in Syracuse, and was killed there during the siege by the Romans under Marcellus.

Argand, Aimé (1755–1803), Swiss physician, inventor of the lamp bearing his name, which was the first to admit a current of air to increase the power of the flame, by use of a chimney glass and circular wick.

Ariosto, Ludovico (1474–1533), one of the most celebrated of the Italian poets, author of *Orlando Furioso*. Besides this famous epic he wrote many comedies, satires, and poems.

Aristides (530–467 B.C.) Athenian statesman and

general who achieved fame at the battle of Marathon, 490 B.C.

Aristippus (*c.* 435–356 B.C.), founded the Cyrenaic school of philosophy, which taught that sensual pleasure was the only happiness. He was a native of Cyrene, in Africa, but became a pupil of Socrates, and settled in Athens.

Aristophanes (*c.* 444–*c.* 385 B.C.) was one of the foremost Athenian play-writers and the greatest of the Greek comic poets. His plays are full of satire, and deal unsparingly with the people and institutions of his time.

Aristotle (384–322 B.C.), Greek philosopher, pupil of Plato, after whose death in 347 he left Athens to become tutor to the young prince Alexander of Macedon. Subsequently at Athens he established his famous school in the garden known as the *Lyceum*, where he lectured in the *peripatos* (cloister) which gave it its name *Peripatetic*. He took the whole field of knowledge as his subject, giving it unity, and providing a philosophy which held its own for 2,000 years.

Arkwright, Sir Richard (1732–1792), was a native of Preston, and in early life a barber and travelling hairdealer. Becoming interested in mechanical problems, he set himself the task of inventing an improved cotton-spinning machine. Hargreaves' spinning-jenny was then the leading machine, but the yarn it produced could only be used for weft: it was not compact enough for warp threads. Arkwright therefore experimented until, by adopting an arrangement of rollers that moved with different velocities, he succeeded in perfecting his "spinning-frame," which successfully produced a yarn that could be used for warp as well as for weft. He took out his first patent in 1769, and entering into partnership with Mr. Jehediah Strutt, of Derby, became a manufacturer on a large scale, in 1771 establishing the first spinning-mill worked by water-power.

Arne, Dr. Thomas Augustine (1710–1778), English composer of considerable merit and of great popularity in his day. He composed numerous ballad operas, and at Drury Lane, Covent Garden, and Vauxhall organised the chief performances for long periods. His best-known opera was *Artaxerxes*, and his most popular songs were *Rule, Britannia!* and *Where the Bee Sucks*.

Arnold, Matthew (1822–1888), son of Dr. Thomas Arnold, achieved a high reputation as poet and critic. As the propounder of the principles of "sweetness and light," as well as by his graceful verse, he secured a high place amongst the literary men of the Victorian era.

Arnold, Thomas, D.D. (1795–1842), headmaster of Rugby from 1828 to his death. His influence at Rugby was such as to give that institution a supreme position among English public schools. A man of intense spiritual feeling, of a sympathetic and lovable nature, yet possessed of all the necessary attributes of scholarship, he was greatly esteemed and venerated.

Arrhenius, Svante August (1859–1927), Swedish chemist, one of the founders of modern physical chemistry. Received 1903 Nobel Prize for originating the theory of electrolytic dissociation (ionisation). Director of the Nobel Institute, 1905–27.

Arrol, Sir William (1839–1913), well-known contractor and engineer, whose firm built the Tay, Forth, and London Tower Bridges as well as the Manchester Ship Canal. Originally a piecer in a cotton-mill, and later a working blacksmith.

Artaxerxes was the name borne by several ancient Persian kings, some of whom achieved great distinction. The first Artaxerxes was the son of Xerxes, and reigned from 464 B.C. for 40 years; he was succeeded by Darius II. (424–404 B.C.), who in turn was followed by Artaxerxes II., who reigned until 358. Artaxerxes III, the last to bear the name, was a cruel and treacherous man and was poisoned in 338.

Arthur, fabled Celtic warrior of *c.* A.D. 600, the first reference to whom is in the 9th-cent. chronicle of Nennius, who speaks of his 12 victorious battles against the invading Saxons. His legend developed into a vast literature in mediaeval times, which was welded together by Sir Thomas Mallory in his great work *Morte d'Arthur*, printed by Caxton in 1485.

Arundel, Thomas, Archbishop of Canterbury (1353–1414), in the reigns of Richard II. and Henry IV, previously Bishop of Ely and Archbishop of York, and for a time Lord Chancellor. An active politician and bitter enemy of heresy.

Ashfield, Lord, P.C. (1874–1948), President Board of Trade, 1916–19; M.P. Ashton-under-Lyne, 1916–20; first Chairman of the London Passenger Transport Board created in 1933.

Aske, Robert, the leader of the Pilgrimage of Grace, directed against the Reformation; executed 1537.

Asoka (273–232 B.C.), Emperor of India (*c.* 255–*c.* 237 B.C.), and the most powerful ruler of his time, his Empire extending from the Himalayas to what is now Madras. He was the first ruler to embrace Buddhism and accord it recognition. Becoming a Buddhist (*c.* 257 B.C.) he turned aside in disgust from the thought of his earlier military conquests, and attempted by missionary propaganda to spread Buddhism throughout his lands. Many rocks and pillars are inscribed with his moral exhortations. He gave great impetus to Buddhism by organising it as the state religion.

Asquith, Herbert Henry, 1st Earl of Oxford and Asquith (1852–1928), Liberal statesman who led a great peacetime administration from 1908 until the outbreak of the First World War and the wartime coalition with the Conservatives from 1915–16 when he was displaced by Lloyd George. Home Sec. (1892–95) in Gladstone's last ministry; Chan. of the Exchequer (1904–8) under Campbell-Bannermann whom he succeeded as Prime Minister. His government enacted important social reforms including old-age pensions (1908) and unemployment insurance (1911). The death of Edward VII in 1910, the struggle over the Irish Home Rule Bill, the declaration of war on Germany, and the Easter Rising in Dublin in 1916 were among the events of his premiership. He resigned the leadership of the Liberal Party in 1926. Earldom of Oxford and Asquith conferred, 1925.

Asser, a Welsh monk of the tenth century, author of a remarkable life of King Alfred.

Astor, John Jacob (1763–1848), the founder of the Astor family of millionaires, was a native of Heidelberg, and emigrating to America, went out to the North-West and began trading in furs, soon building up a large fortune, which he invested in New York real estate.

Astor, Nancy Witcher, Viscountess, C.H. (1879–1964), the first woman M.P. to take her seat in the House of Commons, an American by birth, wife of the 2nd Viscount Astor (1879–1952).

Atatürk, Kemal (1881–1938), builder of modern Turkey. A fine soldier, he defended the Dardanelles against the British in 1915 and drove the Greeks out of Turkey in 1922. President of the Turkish Republic, 1923–38.

Athanasius, St. (296–373), was Bishop of Alexandria. He spent much of his time in bitter theological controversy, and was driven from Alexandria; taking refuge in the desert, he wrote numerous letters in support of Christian doctrine, and under Julian was recalled to Alexandria. The Athanasian creed is supposed to reflect his belief.

Athelstan (895–940), grandson of Alfred the Great, was crowned King of England in 925, and was the first ruler of all England.

Atherstone, William Guybon (1813–98), South African geologist and an originator of the South African diamond industry. He drew attention to the possibility of diamonds near Kimberley and in 1867 identified a crystal found near the Vaal River, thus helping to start mining development.

Attila (406–453), King of the Huns, was a warlike leader, who achieved many conquests over the Roman forces, committing great ravages and laying large tracts of country waste. He marched through Germany and Gaul, and died as he was preparing for another invasion of Italy.

Attlee, Clement Richard, 1st Earl, O.M., K.G., P.C., C.H. (1883–1967), Prime Minister in two successive Labour Governments, 1945–51; served as Deputy Prime Minister to Churchill, 1942–45. He was educated at Haileybury and University Coll., Oxford. Called to the Bar in 1905; tutor and lecturer in social science at the London School of Economics, 1913–23. Became Mayor of Stepney in 1919, Labour M.P. for Limehouse in 1922, and Parliamentary Leader of the Labour Party, 1935–55. During

his Premiership the welfare society was established and the freedom and independence of India granted. Retired in 1955; earldom conferred. His writings include an autobiography, *As it Happened* (1954), and *Empire into Commonwealth* (1960). *See also* Section C, Part I.

Auber, Daniel François Esprit (1782–1871), a distinguished French composer of light operas, *Masaniello*, *Fra Diavolo*, *Le Domino Noir*, etc.

Auchinleck, Field-Marshal Sir Claude J. E., G.C.B., G.C.I.E., D.S.O. (b. 1884), Indian Army officer who was C.-in-C. Middle East, 1941–42, and the last British C.-in-C. in India, 1943–46.

Auden, Wystan Hugh (b. 1907), influential poet and dramatist, b. in England, naturalised American. Succeeded C. Day Lewis as Prof. of Poetry, Oxford Univ., 1956–61.

Auer, Leopold (1845–1930), the famous Hungarian violinist and teacher of the violin, among his pupils being Mischa Elman and Jascha Heifetz.

Augustine, Saint (354–430) the greatest of the Latin fathers, bishop of Hippo, b. at Tagaste in N. Africa of a pagan father and Christian mother (Saint Monica). He ranks high as a philosopher and his influence on Christianity has been second only to that of St. Paul. He was a voluminous writer, the most important works being his *Confessions*, the *City of God*, *On the Trinity*, and *On the Work of Monks*.

Augustine of Canterbury, Saint (d. *c.* 605), the Roman Benedictine missionary monk who was sent to Britain by Gregory the Great in 597 to convert the English peoples to Christianity. He became the first archbishop of Canterbury.

Augustus, Caius Octavianus (63 B.C.–A.D. 14), Roman emperor, succeeded Julius Cæsar. After a triumvirate of twelve years, in which he was associated with Mark Antony and Lepidus, he became supreme ruler and for forty-five years exercised a beneficent and powerful sway. He was a devoted patron of Horace and Virgil.

Aurelius, Marcus Antoninus. *See* **Marcus Aurelius Antoninus.**

Auriol, Vincent (1884–1966), French politician. Voted against surrender in 1940, was interned and escaped to London in 1943. President of the French National Assembly, 1946, and of the Fourth Republic, 1947–54.

Aurangzeb (1618–1707), Mogul emperor of India, 1659–1707, son of Shah Jehan. He was a ruler of ability, and greatly extended his empire by conquest, but his zeal for Mohammedanism aroused the hatred of the Hindus and his persecution of the Sikhs transformed them from a pacifist sect into a militant brotherhood. When he died the disruption of the vast Mogul territory rapidly followed.

Austen, Jane (1775–1817), author of *Emma*, *Mansfield Park*, *Northanger Abbey*, *Persuasion*, *Pride and Prejudice*, and *Sense and Sensibility*. Though confining herself to the personal relations of the English middle classes, she combined artistry, accuracy, imaginative power, satiric humour, sense, and genuine feeling with the ability to create a vast range of living characters, and is often considered the most perfect English novelist.

Austin, 1st Baron, K.B.E. (1866–1941), was the well-known English motor manufacturer. He was the pioneer of the small car—the 7-horse-power car—which he put on the market in 1921.

Avenzoar (Ibn Zuhr) (*c.* 1090–1162), a Moslem physician, born in Seville, the greatest of his time. His chief work was the *Tasir*.

Averroës (Ibn Rushd) (1126–98), Arab philosopher and medical writer, born in Córdova, last and most famous thinker of Moslem Spain. He studied philosophy, theology, mathematics, medicine, and jurisprudence. His greatest works are his commentaries on Aristotle. He was a friend of Avenzoar.

Avicenna (980–1037) of Bokhara, Arab philosopher and physician whose *Canon of Medicine* had an enormous influence on mediaeval Europe.

Avogadro, Amedeo (1776–1856), Italian physicist, remembered for his hypothesis, since known as Avogadro's Law, that equal volumes of gases under identical conditions of temperature and pressure contain the same number of molecules.

Avon, Earl of. (*See* **Eden, R. Anthony.**)

Ayrton, William Edward, F.R.S. (1847–1908), English electrical [illegible]r, inventor of a number of electrical [illegible] instruments. His first wife, **Matilda Chaplin Ayrton** (1846–83), was one of the first woman doctors and his second wife, **Hertha Ayrton** (1854–1923), became known for her scientific work on the electric arc and sand ripples and for her work for woman suffrage.

Ayub Khan, Mohammad, Field Marshal (b. 1907), military leader and President of Pakistan since 1958; educated at Aligarh Moslem Univ. and Sandhurst. Under the 1962 constitution all executive authority is vested in the President.

Azikiwe, Rt. Hon. Nnamdi, LL.D. (b. 1904), Nigerian statesman. His office as Pres. of Fed. of Nigeria, held since 1963, was suspended by military coup (Jan. 1966).

B

Baber or Babar (Zahir ud-din-Mahomet) (1483–1530), founder of the Mogul dynasty which ruled Northern India for three centuries, and a descendant of Tamerlane.

Bach, Johann Sebastian (1685–1750). Born at Eisenach, Germany, he became one of the greatest composers in history and has been called the father of modern music. During his appointment as organist at the Thomaskirche, Leipzig, he composed all his great devotional music, including the wonderful St. Matthew and the St. John Passion and the B minor Mass. His incessant labour affected his eyes, and in 1749 he became totally blind. His family was connected with music for seven generations, of which his was the fifth. *See* **Section E.**

Bach, Carl Philipp Emanuel (1714–88), third son of Johann Sebastian Bach. He is important in the history of music as one of the first experimenters in the symphonic and sonata form.

Backhaus, Wilhelm (b. 1884), German pianist, recognised as one of the most gifted, especially in the interpretation of the great classical and romantic concertos. Professor of the Piano at the Royal College of Music, Manchester, 1905.

Bacon, Francis, Lord Verulam, and Viscount St. Albans (1561–1626), one of the greatest of English philosophers and statesmen; Attorney-General to Elizabeth; Lord Chancellor under James I. His political career was tarnished by certain acts of corruption, for which he paid the penalty, but his writings were marked by keen insight, brilliancy of language, and a depth of thought which place them in the first rank of philosophical literature. His *Novum Organum* and his *Essays* are splendid monuments of learning and wisdom.

Bacon, Roger (1214–1294), the Franciscan friar, was a man of remarkable gifts, of great learning and inventive power. In an age of darkness he was the first to insist on the importance of experiment and can claim the title of founder of experimental science. Optics, explosives, engines, mechanical flight came within the range of his researches. The invention of gunpowder has been attributed to him, but without adequate evidence. For a long time he was looked upon as an alchemist and sorcerer, though of late his discoveries have been more truly appreciated.

Baden-Powell, Lt.-Gen. Lord, O.M., G.C.M.G., G.C.V.O., K.C.B. (1857–1941), brilliant cavalry soldier, famous for his defence of Mafeking in the South African War. Founded the organisation of Boy Scouts (1908) and Girl Guides (1910) to promote good citizenship in the rising generation. Chief Scout of the World, 1921–41.

Baer, Karl Ernst von (1792–1876), Estonian biologist, founder of the science of embryology, and discoverer of the mammalian ovum.

Baffin, William (1584–1622), navigator and explorer who in 1616 discovered the bay which separates the north-east coast of British North America from Greenland, which bears his name.

Bagehot, Walter (1826–77), English economist and journalist. Editor of *The Economist*, 1861–77. Wrote three books of lasting importance, *The English Constitution*, 1867, *Physics and Politics*, 1872, and *Lombard Street*, a description of the Money Market, 1873. He was among the first to advocate the creation of Life Peers to strengthen the House of Lords.

Baird, John Logie (1888–1946), Scottish television pioneer; inventor of the televisor and the noctovisor.

Baker, Sir Benjamin, K.C.B., K.C.M.G., F.R.S.

(1840–1907), an eminent engineer. He was consulting engineer to the Egyptian Government for the Aswan Dam, joint engineer with Sir John Fowler of the Forth Bridge, and engineer of the Central London Tube Railway.

Baker, Sir Herbert, K.C.I.E., R.A. (1862–1946) was an eminent architect who designed the Bank of England, Rhodes House, Oxford, and, with the late Sir E. Lutyens, New Delhi.

Bakst, Léon (1868–1924), Russian painter who designed scenery and costumes for the Russian Ballet of Serge Diaghilev.

Balboa, Vasco Nuñez de (1475–1517), Spanish explorer, who was the first European to set eyes upon the Pacific Ocean.

Baldwin of Bewdley, 1st Earl, K.G., P.C. (1867–1947), the leading Conservative politician between the two world wars and Prime Minister, 1923–24, 1924–29, and 1935–37.

Baldwin, James (b. 1924), American Negro writer, regarded as the most significant of his time. Novels include *Go Tell It to the Mountain* (1953) and *Another Country* (1962). *See* **M6.**

Balewa, Sir Abubakar Tafawa, K.B.E. (1912–1966), Federal Prime Minister of Nigeria, 1960–66; murdered during the crisis of January 1966.

Balfour, Arthur James, Earl of, K.G., O.M., P.C. (1848–1930), statesman, scholar, and philosopher. Entered Parliament as a Conservative in 1874. Prime Minister, 1902–5. He also served as First Lord of the Admiralty under Asquith and as Foreign Secretary under Lloyd George. His most notable action was issuing the Balfour Declaration on Palestine.

Balliol, John de, English baron whose widow in 1269 founded the college at Oxford which bears his name. Fought for Henry III, against Simon de Montfort. Died in exile in 1269.

Baliol, John (1249–1315), son of the above, competed with Robert Bruce for the Scottish throne, and Edward I. decided in his favour. Only reigned four years, when Edward deposed him, committing him to the Tower, and finally banished him from the country. He retired to Normandy. His son, Edward Baliol, recovered his father's kingdom in 1332, and was upheld by Edward III. whilst very unpopular by reason of his having given up the south of Scotland to the English. He renounced his title and throne in 1356, and retired to England on an annuity.

Ball, John (d. 1381), English priest and a leader of the Peasants' Revolt, after which he was excuted. Author of the couplet *When Adam delved, and Eve span, Who was then the gentleman?*

Balzac, Honoré de (1799–1850), one of the greatest of French novelists, and the author of over eighty novels to which he gave the covering title of *La Comédie Humaine*, depicting the appetites and passions of the new social class born of the revolution and Napoleon.

Bampton, John (1689–1751), an eminent divine, who founded the Oxford Bampton Divinity lectures.

Bancroft, Sir Squire (1841–1926), one of the best-known Victorian actor-managers.

Bandaranaike, Hon. Solomon West Ridgway Dias, B.A. (1899–1959). Socialist Prime Min. of Ceylon from 1956 until his assassination in 1959. His widow, Mrs. Sirimawo Bandaranaike, became the world's first woman Prime Minister, 1960–65.

Banks, Sir Joseph, Bt., F.R.S. (1743–1820), was president of the Royal Society for upwards of forty years. As a naturalist he was one of the most eminent men of his time, and encouraged science in every form. When Captain Cook made his voyage to the South Seas in 1768, Sir Joseph accompanied him for the purpose of observing the transit of Venus. He left very valuable botanical collections to the British Museum.

Banting, Sir Frederick Grant, K.B.E., M.C., D.Sc., M.D., F.R.S. (1891–1941). Canadian physician and discoverer of insulin. Prof. of Medical Research, Toronto University, 1923–41.

Bantock, Sir Granville, Mus. Doc.(1868–1946), Professor of Music at Birmingham University 1908–34; Chairman of Trinity Coll. of Music, London. He wrote songs, orchestral and choral music.

Barbirolli, Sir John, F.R.A.M. (b. 1899), English conductor; succeeded Toscanini as conductor of the New York Philharmonic Symphony Orchestra, 1937–42; conductor of the Hallé Orchestra since 1943.

Barbarossa (Red Beard), name given to Frederick I (c. 1122–90), greatest of the mediæval Holy Roman emperors who struggled (1159–77) to free the Empire from the domination of the Pope. The two brothers who were Barbary pirates also had this name: Uruj (c. 1482–1518) was killed by the Spaniards, and Khaireddin (c. 1482–1546) conquered Tunis for the Turks in 1534 and died in Constantinople.

Barbusse, Henri (1874–1935), noted French author and writer of the famous war novel *Le Feu*, which is one of the most remarkable and realistic of all war books, and portrays in a starkly vivid way the experience of the common soldier.

Barker, Dame Lilian, D.B.E. (1874–1955), governor of the Borstal Institution for Girls at Aylesbury, 1923–35; Ass. Comm. of Prisons, 1936–43.

Barnardo, Dr. Thomas John (1845–1905), the founder of the well-known homes for orphan-waifs, for some forty years devoted himself to the protection, education and advancement of destitute children.

Barrie, Sir James Matthew, Bt, O.M. (1860–1937), popular Scottish author and playwright. Among his novels are *A Window in Thrums* and *The Little Minister*, while his plays include *Quality Street*, *The Admirable Crichton*, *Dear Brutus*, *Mary Rose*, *Shall We join the Ladies?* and the children's classic, *Peter Pan*. His work is clever and entertaining and is tinged with mysticism.

Barrow, Isaac (1630–1677), a famous divine, mathematician, Greek scholar, and tutor of Sir Isaac Newton. His "Sermons" are amongst the finest in the language.

Barry, Sir Charles, R.A. (1795–1860), architect of the Houses of Parliament at Westminster which took twenty years to build Knighted in 1852, and buried in Westminster Abbey. His son:

Barry, Sir John Wolfe Wolfe-, K.C.B., F.R.S. (1836–1918), an eminent engineer, designed and carried out some of the most prominent undertakings of the time, including Barry Dock and Tower Bridge.

Barth, Karl (b. 1886), Swiss theologian, one of the leading Protestant thinkers of the 20th century, described by the late Pope John as a Protestant St. Thomas Aquinas.

Bartók, Bela (1881–1945), Hungarian composer, one of the great figures in the music of his century. From an early age deeply interested in folk-song which inspired him in his researches into Hungarian and Rumanian peasant music. His compositions include string quartets, violin sonatas, concertos, orchestral music, a ballet and an opera, and a collection of over 7,000 melodies. Professor at Budapest Conservatory, 1907–12, when he retired into private life as a result of the opposition his compositions aroused. *See* **Section E.**

Bartolommeo, Fra (1469–1517), the distinguished Florentine painter and friend of Savonarola, at whose death he became a monk.

Bartolozzi, Francesco, R.A. (1727–1815), a Florentine engraver who came to London in 1764 where he became one of the original members of the Royal Academy. He produced an enormous number of engravings and was responsible for the stipple technique.

Baruch, Bernard Mannes (1870–1965). American economist. Assisted U.S. Government in both world wars, and in 1946 was chairman of the United Nations Atomic Energy Commission.

Bashkirtseff, Marie (1860–84), Russian painter and writer of a famous autobiographical diary.

Bassi, Agostino (1773–1856), Italian amateur microscopist who first suggested that infectious diseases might be caused by the invasion of the body by micro-organisms.

Batten, Jean Gardner, C.B.E. (b. 1909) the famous New Zealand airwoman who made aviation history by her record solo flight from England to Australia in 1934.

Baudelaire, Charles Pierre (1821–67), French poet of startling originality and great sensitivity, best known for his book of verse *Les Fleurs du Mal*, also a brilliant critic. He was inordinately attached to his mother and allowed his life to be ruined by poverty, despair, and ill-health.

Bax, Sir Arnold Edward Trevor, K.C.V.O., F.R.C.M., F.R.A.M. (1883–1953), Master of the King's Musick, 1942–52; Master of the Queen's Musick, 1952–53. His work includes seven symphonies and several tone-poems for orchestra.

Baxter, Richard (1615–91), a great Nonconformist divine, remarkable for the ability and boldness of his writings.

Bayard, Pierre du Terrail, Chevalier de (1475–1524), a French knight of exemplary conduct and remarkable for his chivalry. Fell at the Battle of Sesia, and was named "Le Chevalier sans peur et sans reproche."

Baylis, Lilian Mary, C.H. (d. 1937), manager of the Old Vic theatre from 1898 and of Sadler's Wells from 1931. Did great work for the British stage.

Beaconsfield, Benjamin Disraeli, Earl of, K.G., P.C. (1804–81). Son of Isaac D'Israeli (*q.v.*). Statesman and novelist; with Burke (*q.v.*) exercised most influence on Conservative political theories. His first novel, *Vivien Grey*, published when he was only twenty-one, was a brilliant success and the author was able to enter Society. *Coningsby* and *Sibyl*, published twenty years later, helped to rouse the social conscience to the evils of industrial life and of the deplorable relations existing between rich and poor (the "two nations"). Disraeli entered Parliament in 1837, but had only short periods of office before his terms as Prime Minister in 1868 and 1874–80. The second period was marked by the purchase of the Suez Canal shares, by the conferment on the Queen of the title, Empress of India, and by a diplomatic triumph at the Congress of Berlin, abroad, and by a continuation of measures for social reform, at home. He was a gifted orator, the rival and antithesis of Gladstone and the friend of Queen Victoria, who favoured his policies, honoured his wife, and called him "Dizzy."

Beardsley, Aubrey Vincent (1872–98), black-and-white artist, whose illustrations in the *Yellow Book* aroused much controversy.

Beatty, 1st Earl, Admiral of the Fleet, P.C., G.C.B., O.M., G.C.V.O., D.S.O. (1871–1936). First Sea Lord, 1919–27. From 1912 to 1916 Commander of Battle Cruiser Squadron. From Nov. 1916 to 1919 succeeded Lord Jellicoe as Admiral of the main British Fleet. On Aug. 28, 1914, fought the German fleet in the Heligoland Bight. On May 31, 1916, Lord Beatty with his battle cruisers was engaged in a great sea fight with the Germans off Jutland, for which he was granted £100,000 and an Earldom in 1919.

Beaumont, Francis (1584–1616), and **Fletcher, John** (1579–1625), joint authors of many plays, including *The Maid's Tragedy* and *Philaster*. Beaumont was buried in Westminster Abbey, and Fletcher interred in St. Saviour's, Southwark. Thought by some to be authors of plays attributed to Shakespeare.

Beaverbrook, 1st Baron (William Maxwell Aitken) (1879–1964), British newspaper owner and politician, a Canadian by birth. A man of tremendous energy and will-power, he rendered great service as Minister of Aircraft Production in the crucial years, 1940–1. He controlled the *Daily Express*, *Sunday Express*, and *Evening Standard* which sponsored his various political campaigns, notably the Empire Free Trade Movement. Known affectionately as "Max" or "The Beaver."

Becket, Thomas (1118?–70), saint and martyr, Archbishop of Canterbury under Henry II. A powerful and ambitious prelate who boldly supported the authority of the Pope against the dictates of the King, and was assassinated in Canterbury Cathedral December 29th, 1170, being canonised two years later.

Becquerel, Antoine Henri (1852–1908), French physicist who in 1896 discovered radioactivity in uranium. Shared with the Curies the 1903 Nobel Prize in Physics.

Bede, "The Venerable" (673–735), a monk of great influence and ability whose historical works cover a great range and are valuable in the outline they give of the early history of this country.

Beecham, Sir Thomas, Bt., C.H. (1879–1961), conductor and impresario. Founded the London Philharmonic Orchestra in 1931; introduced into England the operas of Richard Strauss, Russian operas, and the Diaghilev ballet; championed the music of Delius. Recognised as one of the world's greatest conductors, especially in the interpretation of Mozart and Wagner. Conductor of the Royal Philharmonic Orchestra (1946). Pub. Frederick Delius biography (1959); Memoirs: *A Mingled Chime*.

Beecher, Henry Ward (1813–1887), an eminent American preacher and lecturer, whose church at Brooklyn was for many years the most popular in the United States. Brother of Mrs. H. B. Stowe.

Beerbohm, Sir Max (1872–1956), brilliant critic and caricaturist who contributed to the *Saturday Review* during his "twelve years' bondage to dramatic criticism" (1898–1910).

Beethoven, Ludwig van (1770–1827), one of the world's greatest musicians and composers, born at Bonn of a poor but musical family, his father being a tenor singer in the service of the electoral prince at Bonn. As a child he was already remarkable for his playing of the harpsichord and violin and for his power of extemporization. Some of his compositions, sonatas, songs and pianoforte variations were published when he was only 13. At 17 he visited Vienna and played before Mozart who promptly recognised his genius. When he was about 30 he began to suffer from the worst malady that could possibly have befallen him: he became deaf. He faced his fate with indomitable courage and perhaps more than any other artist continued to develop until he reached the loftiest pinnacle of musical fame. Between the years 1805 and 1808, Beethoven composed some of his greatest works: the oratorio *Mount of Olives*, the opera *Fidelio*, and the *Pastorale* and *Eroica* symphonies besides a number of concertos, sonatas and songs. He composed four overtures to *Fidelio* at different periods: *Leonore No. 2* (1805), *Leonore No. 3* (1806), *Leonore No. 1* (1807) and *Fidelio* (1814). The *Mass in C* was first performed in 1810 and the *Mass in D* was written between the years 1819 and 1822. The symphonies, nine in number, rank as the greatest ever written and the pianoforte sonatas and string quartets are unequalled in beauty. He died at Vienna at the age of 56. *See* Section E.

Behring, Emil von (1854–1917), German bacteriologist and father of the science of immunology. Awarded Nobel Prize in 1901.

Behring, Vitus (1680–1741), Danish navigator who entered the Russian service and in 1728 discovered Behring's Strait, afterwards being wrecked on Behring's Island, where he died.

Belisarius (505–565), brilliant Roman general under Justinian, famed for his campaigns against the Vandals, Ostrogoths, and Persians.

Bell, Alexander Graham, (1847–1922), born in Edinburgh, emigrated to Canada in 1870 and in 1871 lectured in Boston, mainly to teachers of the deaf, later becoming an American citizen. In 1876 exhibited an invention which was developed into the telephone. Invented the photophone, and devoted much attention to the education of deaf-mutes.

Bell, Gertrude Margaret Lowthian, C.B.E. (1868–1926), the "uncrowned Queen of Arabia," was a famous traveller in the East, especially in Arabia.

Bellamy, Edward (1850–1898), American journalist and author of *Looking Backward*, a utopian novel in which he foretells of many changes that have since come to pass.

Bellini, a celebrated family of Venetian painters of the Early Renaissance: Jacopo (*c.* 1400–70) and his two sons **Gentile** (1429–1507), whose works include the *Adoration of the Magi* (National Gallery), and **Giovanni** (*c.* 1429–1516), the most important painter of the 15th cent., brother-in-law of Mantegna, and teacher of Giorgione and Titian.

Bellini, Vincenzo (1801–35), Italian operatic composer; born in Sicily, the son of an organist. His graceful vocal melodies were much admired by his friend Chopin and he enjoyed successes in Paris and London. His best-known operas are *I Capuleti ed i Montecchi*, *La Sonnambula*, *Norma*, and *I Puritani*. *See also* E10(1).

Belloc, (Joseph) Hilaire (Pierre) (1870–1953), a writer of great versatility whose works include *The Bad Child's Book of Beasts*, *The Path to Rome*, *Hills and the Sea*, *Cautionary Tales*, and historical studies of Danton, Robespierre and Richelieu.

Belzoni, Giovanni Battista (1778–1823), Italian archaeologist who settled in England at the beginning of the 19th century. He turned his attention to hydraulic experiments, and went

to Egypt with a view to getting the Government to sanction a scheme for raising the water of the Nile. He was then attracted to the study of Egyptian antiquities.

Benedict, St. (c.480 – c.543), b. at Nursia near Spoleto, in Umbria; founded twelve monasteries, and the Order of Benedictine Monks, at Monte Cassino, near Naples. Here he wrote his celebrated Rule, a unique document of wide application. (*See* Monasticism, J30).

Benes, Dr. Eduard (1884–1948), Czechoslovak statesman; co-founder with Thomas Masaryk of the Czech Republic; Foreign Minister, 1918–35, and President 1935–38 and 1940–48. An all-party ministry was overthrown by a communist *coup d'état* in February 1948, and Benes, in failing health, resigned the Presidency in June, dying in September.

Benavente y Martinez, Jacinto (1866–1954), one of the greatest of Spanish dramatists. Author of *Los Intereses Creados* and other famous plays. Nobel Prizewinner, 1922.

Ben-Gurion, David (b. 1886), Zionist leader, prominently connected with the Labour movement in Palestine in between the world wars. Prime Minister of Israel, 1948–63.

Bennett, Enoch Arnold (1867–1931), author and journalist. His stories of the Pottery Towns, where he was brought up, are of high merit. *The Old Wives' Tales*, *Clayhanger*, and *Hilda Lessways* are among his most successful novels. He also wrote plays, including *Milestones*, *The Great Adventure*, and *Mr. Prohack*.

Bennett, James Gordon (1841–1918), proprietor of the *New York Herald*, and a famous yachtsman and motorist. He sent out Stanley on the expedition which resulted in the finding of Livingstone.

Bennett, Sir William Sterndale (1816–1875), English composer best known for his oratorio *The Woman of Samaria*. Schumann pronounced him to be "a thorough Englishman, a glorious artist, and a beautiful and poetic soul."

Bentham, Jeremy (1748–1832), the founder of the school of political philosophy, the tenets of which were extended by John Stuart Mill. His works on *Government*, *Usury*, and *The Principles of Morals and Politics*, expound the Utilitarian system with great lucidity.

Bentley, Richard (1662–1742), an eminent classical scholar and critic, for long Master of Trinity College, Cambridge. He was a formidable controversialist and did pioneer work in textual criticism.

Benz, Karl (1844–1929), German engineer whose motor car produced in 1885 was one of the first to be driven by an internal-combustion engine.

Béranger, Jean Pierre de (1780–1857), was the most popular song writer that France has produced. His songs were often written to serve some passing political purpose, and were invariably in harmony with popular sentiment.

Beresford, William Carr Beresford, Viscount (1768–1854), British General. Participated in capture of Cape Colony and of Buenos Aires. Reorganised Portuguese Army. Master-General of Ordnance in Wellington administration.

Berg, Alban (1885–1935), Austrian composer whose best known work is the three-act opera *Wozzeck*, based upon a drama by Büchner (*q.v.*), which has become a modern classic. (E16(2)).

Bergson, Henri Louis (1859–1941), French philosopher, exponent of the theory of vitalism and the life force. Member of French Academy, 1941; Nobel Prize for Literature, 1927. Author of *Matter and Memory* (1896) and *Creative Evolution* (1907).

Bériot, Charles Auguste de (1802–70), Belgian violinist, whose first wife was the great operatic contralto Malibran. His son Charles Wilfrid de Bériot (1833–1914) was a fine pianist and the teacher of Ravel.

Berkeley, George, D.D., Bishop of Cloyne (1685–1753), the propounder of the philosophy that the only things that are real are our ideas of what is presented to our senses. In support of this philosophy he wrote several works of great ingenuity of argument, chief amongst them being his *Alciphron, or the Minute Philosopher*.

Berlin, Irving (b. 1888), American composer of popular songs, and the pioneer of both ragtime and jazz music; his songs including *Alexander's Rag-time Band*, *Always*, *What'll I Do?* were the beginning of popular jazz.

Berlin, Sir Isaiah, C.B.E., M.A. (b. 1909), British University teacher, b. Riga; Chichele Professor of Social and Political Theory at Oxford since 1957. His works include *Karl Marx* (1948), *The Hedgehog and the Fox* (1953), *The Age of Enlightenment* (1956). His series of lectures on *Some Sources of Romanticism*, broadcast 1966–7 were much enjoyed.

Berlioz, (Louis) Hector (1803–69), composer, born in S.E. France, the son of a country doctor; eccentric, highly-endowed, he was the greatest figure in the French romantic movement. His outstanding dramatic works are *La Damnation de Faust* and the *Roméo et Juliette* symphony. His first wife was an Irish actress, Harriet Smithson, for whom he formed a romantic attachment while she was appearing in Shakespearean parts in Rome.

Bernadotte, Count Folke (1895–1948), nephew of King Gustav V. of Sweden; active in Swedish Red Cross; intermediary through whom Himmler attempted to capitulate in 1945; U.N. mediator in Palestine in 1947; assassinated by Jewish terrorists.

Bernadotte, Jean Baptiste (1764–1844), was a French commander of great distinction who served under Napoleon, and in 1810 was chosen heir to the throne of Sweden. In 1818 he succeeded as Charles XIV., and was a capable ruler.

Bernal, John Desmond, M.A., F.R.S. (b. 1901). Professor of Physics, Birkbeck College since 1938. Author of *Science in History*, *The Physical Basis of Life*, *The Origin of Life*, and of many other works on scientific and social subjects, notably crystallography, poison gases, and post-war housing.

Bernard of Menthon (923–1008), patron saint of mountaineers. Founded the alpine hospices of Saint Bernard on the famous Great Saint Bernard Pass between Switzerland and Italy.

Bernard, Saint, of Clairvaux (c. 1090–1153), famous French abbot of the monastery of Clairvaux whose sermons and letters had very great influence in Western Europe.

Bernhardt, Sarah (1845–1923), the most renowned tragedienne of her time. Became a member of the Comédie Française after the Siege of Paris, and thereafter occupied a specially prominent position as an actress. Her first performance in London was in 1879. Among her most conspicuous successes are *Théodora*, *Fédora*, and *La Tosca*, while she also appeared as Hamlet with distinction.

Berthelot, Marcellin Pierre Eugène (1827–1907), French chemist and politician, and the first to produce organic compounds synthetically.

Berzelius, Jöns Jakob (1779–1848), Swedish chemist, whose researches laid the foundations for modern chemical science. He devised the system of chemical symbols in use today and discovered several elements.

Bessemer, Sir Henry, F.R.S. (1813–1898), famous for his invention of the well-known process of converting cast-iron direct into steel. His invention entirely revolutionised steel manufacture, greatly reducing the cost of production and making it possible to utilise steel in many directions where previously iron only had been used.

Bevan, Rt. Hon. Aneurin, M.P. (1897–1960). British socialist politician of remarkable genius; architect of the National Health Service which came into operation in 1948. M.P. for Ebbw Vale, 1929–60; Min. of Health, 1945–51; Min. of Labour, Jan.–Apr. 1951.

Beveridge, Lord, K.C.B. (1879–1963), British economist. Director of the London School of Economics, 1919–37, and Master of University College, Oxford, 1937–44. Drew up the Beveridge Plan, published in 1942, which formed the basis of the present Health and Insurance Schemes.

Bevin, Rt. Hon. Ernest, M.P. (1881–1951), Secy. of State for Foreign Affairs 1945–51; Minister of Labour and National Service, 1940–45. A British Trade Union Leader who became prominently associated with the Dockers Union, of which he was Assistant General Secretary and of the Transport and General Workers Union of which he was still General Secretary when he entered the Coalition Government as Minister of Labour. He was Chairman of the General Council of Trades Union Congress, 1937.

Bichat, Marie François Xavier (1771–1802), French physiologist and anatomist whose study of tissues founded modern histology. His theory was that life is " the sum of the forces that restrict death."

Biddle, John (1615–62), the first English Unitarian. He was fined, imprisoned and banished for his publications attacking the Holy Trinity. Under a general Act of Oblivion in 1652 he resumed his teachings, which led to further imprisonment, and as a result he died of fever.

Binyon, (Robert) Laurence, C.H. (1869–1943), English poet, art critic, and authority on Oriental art, keeper of prints and drawings at the British Museum.

Birch, (Samuel John) Lamorna, R.A. (1869–1955), English landscape painter in oils and water-colours, well known for his charming Cornish landscapes and sea studies. His pictures are hung in all the principal galleries of England.

Birkbeck, George (1776–1841), physician, philanthropist, and philosopher. A Yorkshireman who settled in London in 1804, and became the chief founder of Mechanics' Institutes.

Birkenhead, 1st Earl of, P.C., G.C.S.I. (1872–1930), Sec. for India, 1924–1928. Lord Chancellor, 1919–1922. Attorney-General 1915 to 1919. M.P. for the Walton Divn. of Liverpool from 1906 to 1918, and West Derby Divn. thereof from Dec. 1918 to Jan. 1, 1919.

Birkett, 1st Baron (William) Norman, Q.C. (1883–1962), great English advocate; Lord Justice of Appeal, 1950–7; Judge King's Bench Div. 1941–50; British Mem. (Deputy) Int. Mil. Tribunal at Nuremberg 1945–46; M.P. (L.) for East Nottingham, 1923–24 and 1929–31.

Bishop, Sir Henry Rowley (1786–1855), composer of many popular ballad operas and songs. *Maid Marian*, *Guy Mannering* and *The Miller and his Men*, are his best-known operas. He was also a very successful glee-writer, and was the composer of *Home, Sweet Home.* Was the first musician to be knighted in 1842.

Bismarck, Otto Eduard Leopold von, Prince Bismarck, Duke of Lauenburg (1815–98), Prusso-German statesman, chief architect of the German empire. Of Junker family he began his diplomatic career in 1851 when he was appointed Prussian member of the revived German Diet of Frankfurt. Prussian ambassador at St. Petersburg (1859–62), where he gained the confidence of the new Tsar (Alexander II), and at Paris (1862), where he had the opportunity of studying Napoleon III. Recalled to Germany by William I to head his government, from which time dates the autocratic rule which was ultimately to prove so disastrous for Germany and the world. There followed the events which led to the victory over Austria in 1866, the humiliation of France in 1871 culminating in William I being proclaimed emperor of Germany at Versailles. From 1871 until the death of William I in 1888 the rule of the " iron chancellor " dominated Europe and German domestic affairs. A struggle for supremacy developed between Bismarck and William II which ended (1890) in the " old pilot " being dropped, to use a figure of speech made memorable by one of Tenniel's cartoons. Bismarck retired to his country estates to spend the rest of his life in criticism of the emperor.

Bizet, Georges (1838–75), properly Alexandre César Léopold, French composer who gave the operatic stage several operas full of charming melody and whose immortal *Carmen* from the story by Mérimée was his greatest achievement. He died too young to enjoy popularity.

Björnson, Björnstjerne (1832–1910), the Norwegian poet, dramatist, and novelist is one of the great names in modern European literature, his poems, plays, and stories being marked by a strong intellectuality and a rich imagination.

Black, Joseph (1728–99), Scottish chemist. Prof. of anatomy at Glasgow (1756–60) and of medicine and chemistry at Edinburgh (1760). Specially known for discoveries of carbon dioxide (he called it " fixed air ") and latent heat. His original work earned him the title father of quantitative chemistry.

Blackett, Patrick Maynard Stuart, O.M., C.H., F.R.S., M.A. (b. 1897), British physicist; Professor Emeritus and Senior Research Fellow of Imperial College, London; one of Labour Government's senior scientific advisers. Worked with Rutherford at Cavendish Laboratory and his work on nuclear and cosmic ray physics gained him a Nobel Prize in 1948. His studies also include operational research and magnetism. Author of *Military and Political Consequences of Atomic Energy* (1948). Pres. British Association, 1957; Pres. Royal Society, 1966.

Blackmore, Richard Doddridge (1825–1900), a novelist who in 1869 made a great reputation with his romantic story of *Lorna Doone.*

Blackstone, Sir William (1723–1780), was a Justice of the Court of Common Pleas. His great work, *Commentaries on the Laws of England*, became one of the British classics.

Blackwood, Algernon, C.B.E. (1869–1951), British author. As a young man, farmed in Canada and worked on New York newspapers. Then, from 1906, produced a steady flow of books, plays, and short stories of high quality.

Blair, Robert (1699–1746), a noted Scottish poet, whose poem, *The Grave*, entitles him to a place in all collections of British poetry.

Blake, Robert (1599–1657), Parliamentary general and an admiral in the Cromwellian navy in the Dutch and Spanish wars.

Blake, William (1757–1827), painter, poet, and mystic, whose *Songs of Innocence* and scriptural drawings reveal an intense spirituality. He was a highly independent and original thinker and has been called " the great teacher of the modern western world."

Bland-Sutton, Sir John, Bt., M.D. (1855–1936), an eminent surgeon, whose association with the Middlesex Hospital is commemorated by the Bland-Sutton Institute of Pathology.

Blasco-Ibáñez, Vicente (1867–1928), a Spanish man of letters who wrote *The Four Horsemen of the Apocalypse* and other novels which made him world-famous.

Blériot, Louis (1872–1936), French airman; the first to fly the English Channel from Calais to Dover, July 25, 1909.

Bligh, William (1754–1817), British sailor who had a noted career as a brave and able officer but who is chiefly remembered for the mutiny in 1789 on his ship *The Bounty* on a breadfruit expedition from Tahiti to the West Indies. In 1776 he had sailed with Cook as master of the *Resolution.* As Governor of New South Wales (1806) he fought to suppress the rum traffic. Promoted vice-admiral in 1814.

Blind, Karl (1826–1907), was a native of Mannheim, and in 1847 associated himself with the German revolutionary movement, but was arrested and imprisoned. Gaining his liberty, he resided in Brussels for a time, and afterwards settled in London, remaining in close touch with men like Mazzini and Louis Blanc, and by pen and speech constantly advocating political freedom.

Bliss, Sir Arthur (b. 1891), English composer, succeeded Sir Arnold Bax as Master of the Queen's Musick in 1953. His best known works are the *Colour Symphony* (1922), *Morning Heroes* (1930) and his ballet *Checkmate* (1937). Mus. Dir. B.B.C., 1941–44.

Bloch, Ernest (1880–1959), composer, whose music is characterised by its Jewish and oriental themes. He was born in Geneva, Switzerland, and became a naturalised American citizen.

Blomfield, Sir Reginald, R.A., M.A., F.S.A. (1856–1942); was a prominent architect, designer of gardens and country houses.

Blondin, Charles (Jean François Gravelet) (1824–1897), a famous French rope performer, who crossed Niagara Falls on a tight-rope.

Blücher, Field-Marshal Gebhard Leberecht von (1742–1819), was the famous Prussian commander who, after a long and brilliant military career, joined forces with Wellington in the final campaign against Napoleon, and materially helped to win the great victory of Waterloo by advancing to Wellington's support.

Blum, Léon (1872–1950), statesman and architect of French socialism. Led a " popular front " government in 1936 and a " caretaker " government for a brief period 1946–47. Served as vice-premier 1937–38. During 1940–45 was interned in Germany.

Blunden, Edmund Charles (b. 1896), English poet and critic; Prof. of Eng. Lit. at Tokyo Univ., 1924–27; Fellow and Tutor Eng. Lit., Merton College, Oxford, 1931–43; Prof. of English, Hong Kong Univ., 1953–64. Succeeded Robert Graves as Prof. of Poetry at Oxford, 1966.

Blunt, Wilfred Scawen (1840–1922), English poet and political writer who after retiring from the diplomatic service (1858–70) championed Egyptian, Indian, and Irish independence; imprisoned in 1888 for activities in the Irish Land League. His *Secret History of the English Occupation of Egypt* (1907) aroused much controversy. He married a granddaughter of Lord Byron.

Boadicea, queen of the Iceni (of Norfolk), also called **Boudicca**. She raised an army against and defeated the Roman invaders, but was afterwards vanquished by Suetonius and committed suicide in 62.

Boccaccio, Giovanni (1313–1375), an Italian author who has often been called the father of the novel. He had a lively imagination and a graceful style, and his famous *Decameron*—condemned by two Popes and by the Council of Trent—has been a fount of inspiration to poets and story-tellers from Shakespeare to Keats.

Boccherini, Luigi (1743–1805), Italian composer, contemporary of Haydn, who first gained fame as a 'cellist. Settled in Madrid in 1769 as composer to the Chapel of the Infante, which position he held until 1785. Was appointed composer to the Court of Frederick William II. of Prussia, but returned to Spain in 1797, and died in poverty in Madrid.

Bode, Johann Elert (1747–1826), German astronomer remembered mainly for his law (known as Bode's Law) for the calculation of the relative distances of the planets from the sun.

Boehm, Sir Joseph Edgar, Bt., R.A. (1834–90), British sculptor. Executed several famous monuments and statues including that of Carlyle on the Chelsea Embankment, the monument to Dean Stanley in Westminster Abbey, Darwin in the Natural History Museum, Kensington, and the equestrian statue of the Duke of Wellington at Hyde Park Corner.

Bohr, Niels Henrik David (1885–1962), Danish nuclear physicist whose researches into the structure of the atom gave him great authority in the world of theoretical physics. With Rutherford he applied the quantum theory to the study of atomic processes. Awarded Nobel Prize for Physics, 1922.

Boieldieu, François Adrien (1775–1834), French composer whose masterpiece, *La Dame Blanche*, was published in 1825. Composed many works in collaboration with Cherubini and Mehul. Succeeded Mehul as Professor of Composition at the Conservatoire, Paris, in 1817.

Boileau-Despréaux, Nicolas (1636–1711), literary critic and French poet who was contemporary with Molière, Racine, and La Fontaine. He wrote many classical imitations and is famous for his *Satires*.

Boito, Arrigo (1842–1918), Italian poet and composer. He wrote the libretti of *Otello* and *Falstaff* for Verdi, and for his own operas of *Mefistofele* and many others.

Boleyn, Anne (1507–36), queen of Henry VIII and mother of Queen Elizabeth. Originally maid-in-waiting to Catharine of Aragon and her successor when Catharine's marriage was annulled. She failed to produce a male heir and was beheaded on a charge of adultery.

Bolivar, Simón (1783–1830), South American revolutionist, b. Caracas, called the Liberator; today revered as the greatest of Latin American heroes; with some British aid freed N.W. South America from Spain, founding Grand Colombia (now Venezuela, Colombia, Panama, Ecuador); died poor, of tuberculosis, in Colombia, after Venezuela had left the Union.

Bonaventura, St. (1221–1274), a Franciscan monk of great learning and piety, and a leading Schoolman. He was called "the Seraphic Doctor."

Bondfield, Rt. Hon. Margaret Grace, C.H. (1873–1953), Min. of Labour, 1929–31. Represented Northampton, 1923–24. Wallsend, 1926–31. First woman member of a British Cabinet.

Bone, Sir Muirhead (1876–1953), Scottish artist, famous for his drawings and etchings of architectural subjects. Excelled in dry-point and drawings of intricate scaffolding. His son Stephen Bone, painter and critic, died in 1958 at the age of 53.

Bonheur, Rosa (1822–1899), a native of Bordeaux, and one of the most noted animal painters of the 19th century.

Boniface, St. (c. 675–754), a Benedictine monk, native of Devon, original name Wynfrith. Sent by Pope Gregory II. on missionary work in Germany; appointed archbishop of Mainz, 746. Attacked and killed with over 50 companions by pagans in Friesland

Bonnard, Pierre (1867–1947), French painter of landscapes, still-lifes, and nudes, a great colourist and skilled draughtsman, acclaimed as one of the greatest painters of the century. Exhibition at the Royal Academy, 1966.

Booth, Edwin (1833–93), American Shakespearean actor, son of Junius Brutus Booth, the English tragedian, and brother of John Wilkes Booth, who assassinated President Lincoln.

Booth, William (1829–1912), founder and first general of the Salvation Army, b. Nottingham. He entered the Methodist New Connexion and was from the first interested in evangelical work. In 1865, with the help of his wife, Catherine Booth, he began mission work in the East End of London which led to the creation in 1878 of the Salvation Army on military lines His zeal and organising ability developed it into a great religious military organisation with branches in many parts of the world. His son Bramwell (*d.* 1925) and his daughter Evangeline were among his successors. *See also* **J39**.

Borgia, Caesar (1476–1507), the masterful and unscrupulous son of Pope Alexander VI., who paved his way to power by the murder of those who stood in his way, and aided by Louis XII. of France, became ruler of Romagna, the Marches, and Umbria. Pope Julius II. banished him from Rome, and he was imprisoned in Spain, but escaped to find a soldier's death in the Army of Navarre in the invasion of Castile.

Borodin, Alexander Porfyrievich (1834–87), Russian composer who was a professor of chemistry and founded a school of medicine for women. In a busy professional life he wrote two symphonies, three string quartets, the symphonic sketch *In the Steppes of Central Asia*, some beautiful songs, piano music, and the opera *Prince Igor*, left unfinished at his death but completed by his friends Rimsky-Korsakov and Glazunov.

Borrow, George Henry (1803–81), English author, for many years agent for the British and Foreign Bible Society; in the course of his wanderings studied gypsy life and wrote of his experiences in *Lavengro*, *Romany Rye*, *Bible in Spain*.

Bose, Subhas Chandra (1897–1945), Indian nationalist leader; killed in aeroplane crash.

Boswell, James (1740–1795), made himself famous by writing *The Life of Dr. Johnson*, spending some years in close intimacy with the great lexicographer, and producing what is probably the finest biography in the language. His own journals and letters, collected together by Yale University and published in 1949 as *The Boswell Papers*, are among the greatest literary collections ever assembled.

Botha, General the Rt. Hon. Louis (1862–1919), the Boer general who succeeded Joubert in command of the Transvaal forces in the Boer War 1899–1902. On parliamentary government being granted to the Transvaal in 1907 he became the first Prime Minister, and attended the Imperial Conference in England the same year. In 1910 made first Premier of the South African Union. After the outbreak of war with Germany took the field at the head of a Union force and, in addition to putting down a rebel movement engineered by Germany, conquered a large portion of German African Territory.

Bottesini, Giovanni (1821–89), Italian double-bass player, also famous as an opera conductor and composer.

Botticelli, Sandro (c. 1444–1510), Italian painter and disciple of Savonarola, the democrat. Produced many notable pictures, and assisted in the decoration of the Sistine Chapel. His illustrations to Dante's *Divine Comedy* are world-famous.

Bottomley, Horatio (1860–1933), politician, journalist, financier, and for many years one of the most notorious characters in England.

A brilliant speaker, he was twice M.P. for South Hackney. Altogether 260 petitions in bankruptcy were presented against him, mostly without effect; he was constantly in the law courts, defending himself with skilful audacity against famous K.C.s. Millions of pounds passed through his hands, much of it obtained from small investors, but he died in poverty after serving seven years' penal servitude for fraud.

Botvinnik, Mikhail (b. 1911), Russian chess player; world champion 1948–57, 1958–60, 1961–63. Retired 1965.

Boughton, Rutland (1878–1960), English composer who has also written on the history and philosophy of music. His opera *The Immortal Hour* has enjoyed great success.

Boult, Sir Adrian C., Kt., M.A., D.Mus., F.R.C.M. (b. 1889). President London Philharmonic Orchestra, 1965; and its chief conductor, 1950–57; conductor of the B.B.C. Symphony Orchestra, 1930–50, and Musical Director B.B.C., 1930–42.

Bowdler, Thomas (1754–1825), a pious English physician, who issued expurgated editions of Shakespeare and Gibbon, eliminating all expressions offensive to good taste. Hence the term "bowdlerise."

Boyce, William (1710–79), famous London organist, composer of church music, songs and cantatas, and master of the orchestra of George III.

Boyd Orr, John, 1st Baron, C.H., F.R.S., M.D., D.Sc. (b. 1880), scientist, farmer and nutritional expert. Prof. of Agriculture, Aberdeen University, 1942–45; Director-General, World Food and Agricultural Organisation, 1945–48, Chancellor of Glasgow Univ, 1946. Nobel Peace Prize, 1949.

Boyle, Hon. Robert, F.R.S. (1627–1691), English scientist who with Robert Hooke laid the foundations of the modern sciences of chemistry and physics. He established "Boyle's law," which states that the volume of a gas varies *inversely* as the pressure upon it, provided temperature be constant.

Bradley, General of the Army Omar N. (b. 1893), distinguished American soldier who was appointed chairman of the Joint Chiefs of Staff in succession to Gen. Eisenhower in 1949. Commanded 2nd U.S. Army Corps in Tunis and Sicily, the American Assault Forces in Normandy in 1944, and later the 12th U.S. Army Group. Retired 1953.

Bradman, Sir Donald George (b. 1908), Australian cricketer and one of the world's best batsmen. Captained Australia in Test matches against England, 1936–48.

Bragg, Sir Wm. (Henry), O.M., K.B.E., F.R.S., M.A., D.Sc. (1862–1942), was a brilliant scientist. Nobel Physics Prize, 1915. Was Director of the Royal Institution of Great Britain; Fullerian Prof. of Chemistry, Royal Institution, and Director of Davy-Faraday Research Laboratory, 1923–42; President of British Association, 1928. President of the Royal Society, 1936–40.

Bragg, Sir (William) Lawrence, C.H., O.B.E., M.C., F.R.S. (b. 1890), succeeded Lord Rutherford as Cavendish Prof. of Experimental Physics, Cambridge Univ., 1938–53. Dir. Royal Institution, 1954–66 Shared with his father (Sir Wm. H. Bragg) the 1915 Nobel Prize for research work on X-rays and crystal structures.

Brahe, Tycho (1546–1601), a celebrated Danish astronomer, and fellow-worker of Kepler. With large sums of money put at his disposal by Frederick II. of Denmark, he built an observatory called Uraniborg on the island of Hveen, near Copenhagen, where for over 20 years he carried out a vast programme of accurate and systematic observations of the heavenly bodies and compiled tables of their motions.

Brahms, Johannes (1833–97), composer, regarded as outstanding figure of German classic-romantic school; born in Hamburg, the son of a double-bass player. His compositions are classical in form yet possess deep intensity of expression and poetic significance. He composed four symphonies which rank amongst the greatest ever written, two piano concertos, a violin concerto, a double concerto for violin and 'cello, much fine chamber music, numerous songs of great lyrical beauty, and choral work, notable among which is his *German Requiem*. Lifelong friend of the Schumanns. His life was devoted to music; he never married.

Braille, Louis (1809–52), French educationist, who as teacher of the blind, perfected his system o. reading and writing for the blind. As the result of an accident when he was three years old he was himself blind.

ramah, Joseph (1749–1814), a Yorkshireman who devoted himself to invention, introduced numerous mechanical improvements, including the hydrostatic press, a liquid-pumping apparatus, a most ingenious series of safety locks, and bank-note printing machines.

Brampton, Lord, P.C. (1817–1907), long known to the public as Sir Henry Hawkins. Was famous as an advocate, and took part in many celebrated cases, including the Tichborne trial. His *Reminiscences*, published in 1904, was one of the books of the year.

Brandes, Georg Morris Cohen (1842–1927), Danish literary critic who exerted a vitalising influence on literature and art.

Brangwyn, Sir Frank, R.A., R.P.E. (1867–1956), artist of Welsh extraction born at Bruges; first worked for William Morris making cartoons for textiles. He was regarded as the greatest mural artist and etcher of his day.

Breakspear, Nicholas. *See* Adrian IV.

Brecht, Bertold (1898–1959), German dramatist and poet, whose cynical and satirical works are characteristic of the period between the two world wars. He left Germany in 1933 for Russia, went to the United States in 1941, and returned to E. Germany after the war. His plays include *Die Dreigroschenoper* (with music by Kurt Weill). *See also* Section I.

Brennan, Louis, C.B. (1853–1932), successful inventor, born in Ireland. Paid £120,000 by the British Government for his gyro-directed torpedo; also the inventor of a mono-rail locomotive on the gyroscope principle

Breton, Andrée (1896–1966), French poet, founder of the surrealist literary movement in France and a close friend of Apollinaire.

Brewster, Sir David, LL.D., F.R.S. (1781–1868), Scottish physicist, a great experimenter and a prolific writer. Noted for his researches into the polarisation of light; invented the kaleidoscope Helped to found the British Association for the Advancement of Science.

Brezhnev, Leonid Ilyich (b. 1906), succeeded Nikita Khrushchev as First Secretary of the Soviet Communist Party in Oct. 1964; formerly President of the Supreme Soviet of the U.S.S.R.

Bridges, Edward, 1st Baron, K.G., G.C.B., G.C.V.O., P.C., M.C. (b. 1892), son of Robert Bridges. Permanent Secretary to the Treasury and Head of Civil Service, 1945–56. Secretary to the Cabinet, 1938–46. Chanc. Reading Univ., 1959. Chairman British Council, 1959–.

Bridges, Robert, O.M., M.A. (1844–1930), was Poet Laureate 1913–30. Practised medicine up to 1882, thenceforward devoting himself mainly to literature. He published several volumes of poems and plays, displaying refined fancy and a broad philosophic spirit. His *Testament of Beauty* was published in 1930.

Bridgewater, Francis Egerton, 3rd (and last) Duke of (1736–1803). The projector of the famous Bridgewater Canal, which was the beginning of the great English canal system, and yielded his family enormous wealth; it was absorbed in 1887 by the Manchester Ship Canal Company, who paid £1,710,000 for it.

Bridgewater, Francis Henry Egerton, 8th (and last) Earl of, F.R.S. (1756–1829), grand-nephew of the last-named, and founder of the famous *Bridgewater Treatises*, written by the most celebrated divines and scientists of the day.

Bridie, James, (pseudonym of Osborne Henry Mavor), C.B.E., LL.D., M.D. (1888–1951), Scottish author and dramatist. Educated at Glasgow Academy and University. The first of his many successful plays was *The Anatomist*, produced in 1931. Others include *Tobias and the Angel*, *Jonah and the Whale*, *Mr. Bolfrey*, *Dr. Angelus*.

Brieux, Eugène (1858–1932), French dramatist, whose moral and realistic plays deal with social evils, such as venereal disease in *Les Avariés* ("Damaged Goods"). Elected a member of the French Academy in 1909.

Bright, Sir Charles Tilstone (1832–88), English

telegraph engineer, who after superintending the laying of telegraph lines in many parts of Great Britain organised the Atlantic Telegraph Company (1856), and as Engineer-in-chief supervised the laying of the first Atlantic Cable (1858).

Bright, Rt. Hon. John (1811–1889), a famous Radical Quaker statesman and orator, one of the chief promoters of the Reform movement which led to the introduction of Free Trade.

Britten, Edward Benjamin, O.M., C.H. (b. 1913), English composer of a variety of music, including song cycles, chamber music, choral works, and the operas *The Rape of Lucrezia*, *Peter Grimes*, *Albert Herring*, *Billy Budd*, *The Turn of the Screw* and *A Midsummer Night's Dream*. His great *War Requiem* was first heard at the consecration of the new Coventry cathedral in 1962. Closely associated with the Aldeburgh Festival. *See* Section E.

Broca, Pierre Paul (1824–80), French pathologist, anthropologist, and a pioneer in neuro-surgery. He localised the seat of speech in the brain in the convolution named after him and originated methods for measuring brain and skull ratios.

Brock, Sir Thomas, K.C.B., R.A. (1847–1922), pupil of Foley, achieved a high reputation as a sculptor. The Queen Victoria Memorial in front of Buckingham Palace is his work.

Brogan, Denis William, M.A. (b. 1900), Prof. of Political Science at Cambridge. An authority on France, America, and Britain, and his works include *The Development of Modern France*, *Politics and Law in the United States*, and *The English People*.

Broglie, French noble family of Piedmontese origin who settled in France in the 17th cent. **Victor Maurice, comte de Broglie** (1671–1745) was marshal of France and fought in the wars of Louis XIV. **Louis Victor, prince de Broglie** (b. 1892) and **Maurice, duc de Broglie** (1875–1960) the eminent French physicists are grandsons.

Brontë, Charlotte (1816–1855), one of the most gifted novelists of the 19th century. Her *Jane Eyre*, published in 1847, attracted universal notice, and her other novels, *Shirley*, *Villette*, and *The Professor*, are all marked by the force of strong genius. Her sisters, **Emily** (1818–48) and **Anne** (1820–49), also wrote novels and poems, Emily's *Wuthering Heights* and some of her verse showing exceptional power.

Brookeborough, Basil Stanlake Brooke, 1st Viscount, C.B.E., M.C. (b. 1888), Prime Minister of Northern Ireland 1943–63. An Ulster Unionist.

Brooke, Rupert (1887–1915), a British poet who died during the first world war, whose works, though few, showed great promise and include the poems *Grantchester* and *If I Should Die*.

Brougham, Lord, P.C., F.R.S. (1778–1868), one of the chief legal luminaries of the 19th century, who made a great name by defending Queen Caroline against George IV.

Brown, Sir Arthur Whitten, K.B.E. (1886–1948), together with Sir John Alcock (d. 1919) in 1919 made the first transatlantic flight, crossing from Newfoundland to Ireland in 16 hr. 12 min.

Brown, John, "of Ossawatomie" (1800–1859), the hero of Harper's Ferry, whose action in inciting certain negro slaves to rebel in 1859 struck the note of alarm which resulted in the Civil War. His attempt to take the Arsenal at Harper's Ferry was defeated, and he was hanged, being afterwards regarded as a martyr by the Abolitionists.

Browne, Charles Farrer (Artemus Ward) (1834–1867), was one of the most whimsical and entertaining humorists America has produced. In addition to his books he wrote and delivered exceedingly funny lectures, and was making an English tour with them when he was seized with a fatal illness, dying at Southampton.

Browne, Hablot Knight (1815–1882), best known as "Phiz," the illustrator of Dickens's novels, from the *Pickwick* period down to *Little Dorrit*.

Browne, Sir Thomas (1605–82), author of *Religio Medici*, was a London physician and antiquary.

Browning, Elizabeth Barrett (1806–1861), English poet, wife of Robert Browning. She was an astonishingly brilliant child, reading Homer at the age of eight. While saddling her pony she injured herself and on her father's orders spent her youth lying on her back in her room, studying and writing. Her meeting with Browning brought a remarkable recovery. In the autumn of 1846 they were secretly married and went to live in Florence. Although now regarded as a comparatively minor poet she was more read than her husband in their lifetime. Best known poems are "Cry of the Children", *Sonnets from the Portuguese* (her own love story) and *Aurora Leigh*, a novel in verse.

Browning, Robert (1812–1889), English poet, son of artistic and cultured parents, whose money enabled him to travel and write poetry. His earlier poems and plays, though marked by singular insight and power, were far from popular, mainly because of a somewhat obscure and involved style. His *Strafford* and *The Blot on the 'Scutcheon* were both produced by Macready, and attained some measure of stage success. After the death of his wife he returned to England and wrote some of his finest work including *Dramatis Personae* and *The Ring and the Book*. He died in Venice.

Bruce, Robert (1274–1329), took part with Sir William Wallace, (*q.v.*) in the revolt against Edward I., later leading the popular cause. Achieved one victory after another, until at Bannockburn he overthrew the English army and ultimately secured Scottish independence. He reigned twenty-two years as King Robert I.

Bruch, Max (1838–1920), German composer and conductor, best known for his G minor violin concerto.

Bruckner, Anton (1824–96), Austrian composer and organist. He wrote nine symphonies, much religious music, including a *Te Deum* for chorus and orchestra, and a string quintet.

Brummell, George Bryan (1778–1840), "Beau Brummell," the fashion leader in English Society when George IV. was Prince of Wales; was a *bon vivant* and gamester whose excesses involved him in imprisonment and ultimate imbecility.

Brunel, Isambard Kingdom (1806–1859), a prominent engineer who constructed the more difficult portions of the Great Western Railways, and many other important works. He also achieved eminence as a designer of steamships.

Brunel, Sir Mark Isambard (1769—1849), father of the last-named, and constructor of the Thames tunnel, finished in 1843.

Brunelleschi, Filippo (1377–1446), Italian architect, born in Florence, pioneer of Renaissance architecture, adapting the ideals of the Roman or classic period to the conditions of his own day. Many examples of his work are to be seen in Florence—in the Pitti Palace, the Churches of San Lorenzo and San Spirito, the great cupola of the cathedral of Santa Maria del Fiore and the beautiful carved crucifix in the Church of Santa Maria Novella.

Bruno, Giordano (*c.* 1548–1600), Italian philosopher and martyr; entered the Dominican Order at Naples in his 15th year. Accused of heresy he fled from his convent and roamed over Europe. In 1592 he returned to Italy and was arrested by the Inquisition. After 7 years in prison was burned at the stake, Feb. 17, 1600. A statue to him was erected in the Campo dei Fiori, 1889.

Brutus, Marcus Junius (85–42 B.C.), Roman Governor and one of the founders of Roman civil law.

Bryant, Arthur Wynne Morgan (b. 1899), English historian and pageant producer. Among his works are *English Saga, 1840–1940*, a life of *George V.*, *The Story of England*, and several books on the Napoleonic war years and the Restoration period, including a balanced and informative biography of Pepys.

Buchanan, George (1506–82), Scottish humanist who spent most of his life in France lecturing and writing Latin poems, plays, and treatises. Montaigne, Mary Queen of Scots, and James VI of Scotland were his pupils at various times. He was the best Latin scholar of his age, and his most important works are *De jure regni apud Scotos* and *Rerum Scoticarum historia*.

Buchman, Rev. Frank Nathan David (1878–1961), American evangelist, founder of the movement known as Moral Re-Armament. Initiated in 1920 the religious fellowship known as the Oxford Group Movement. *See* J30.

Buchner, Eduard (1860–1917), German chemist and professor, famous for his discovery of the enzymes within yeast cells and for his work in the chemistry of fermentation. For this he was awarded the 1907 Nobel Prize for Chemistry.

Büchner, Georg (1813–37), German dramatist

whose career was terminated by his early death at the age of twenty-four, but whose limited output (principally *Dantons Tod* and the fragment *Wozzeck*) is marked by extraordinary power and maturity.

Buckle, Henry Thomas (1821–1862), the author of *The History of Civilisation in England*, one of the most vigorous productions of the 19th century.

Budge, Sir Ernest Alfred Wallis, Litt. D., D. Litt., F.S.A. (1857–1934), a distinguished archæologist who conducted many excavations in Mesopotamia and Egypt. Was Keeper of Egyptian and Assyrian Antiquities at the British Museum, 1893–1924.

Buffon, Georges-Louis Leclerc, Comte de (1707–88), French author and naturalist who devoted his life to the study of natural history and whose great work *Histoire Naturelle* in 36 volumes appeared between 1749 and 1789.

Bulganin, Marshal Nikolai Alexandrovitch (b. 1895), Prime Minister of Soviet Russia, 1955–58. Formerly Soviet Defence Minister. Retired 1960.

Bull, John (c. 1562–1628), was organist to James I. and composed much acceptable music, including, it is supposed, our National Anthem *God save the Queen*.

Bülow, Hans Guido von (1830–94), German pianist and conductor, an outstanding figure among the musicians of his day. He married Liszt's daughter Cosima, who later left him to marry Wagner.

Bunsen, Robert Wilhelm (1811–1899), German chemist, discoverer of the metals cæsium and rubidium, and inventor of the Bunsen burner, battery, and pump. Made many important observations in spectrum analysis.

Bunyan, John (1628–1688), was originally a travelling tinker and is believed to have served in the Parliamentary army. He joined an Independent church in Bedford in 1655 and became a popular preacher. After the Restoration he was thrown into prison, and there wrote *Pilgrim's Progress*, the finest allegorical work in this or any language. Of his other works the *Holy War*, *Grace Abounding*, and *Mr. Badman* are the best known.

Burckhardt, Jacob Christoph (1818–97), Swiss historian whose *The Civilisation of the Renaissance in Italy* is one of the great classics on the subject.

Burghley, William Cecil, Lord (1520–1598), Secretary to Lord Protector Somerset, an influential statesman under Edward VI, and Queen Mary, and subsequently Queen Elizabeth's favourite Minister for forty years.

Burke, Edmund (1729–1797), the acknowledged philosopher of conservatism: son of a Dublin attorney, went to London in 1756, and made his mark in literature by his famous work on the *Sublime and Beautiful*. Later on was private secretary to the Marquis of Rockingham, then Premier, and entered Parliament, where he quickly made a name. An able and earnest debater, he took part in all the great movements of his time, and in 1795, after his retirement, was awarded a handsome pension from the Civil List.

Burnet, Bishop Gilbert (1643–1715), wrote a *History of His Own Times*, which deals with many events of which he had personal knowledge, and is a valuable legacy to historical scholars.

Burnet, Sir John James, R.A. (1859–1938), was a leading British architect, whose most important work was the King Edward VII Galleries of the British Museum, opened in May 1914. Among his many large buildings in London are Adelaide House, and the extension to Selfridge's.

Burney, Fanny (*See* D' Arblay, Madame.)

Burns, Robert (1759–1796), Scotland's greatest poet. Startled the world with a little book of poems in 1786 which proclaimed him a true son of the muses. With the £500 that his book yielded him he bought a farm, obtained an appointment with the Excise in 1789, and for the last five years of his life lived at Dumfries. In his career he poured forth song after song of emotional tenderness, and made his name immortal.

Burton, Sir Richard Francis, K.C.M.G. (1821–1890), explorer, orientalist, and diplomatist, who became famous after making a pilgrimage to Mecca in 1853 disguised as a Mohammedan. Later he did much exploring in Central Africa, wrote several books and made a remarkable literal translation of the *Arabian Nights* (16 vols.).

Busoni, Ferruccio Benvenuto (1866–1920), the greatest pianist of his age, and composer of 3 operas (the last, *Dr. Faust*, unfinished at his death), much orchestral and chamber music, and works for the piano. He was born in Empoli near Florence but spent much of his life in Germany. *See* E17(1).

Bustamante, Sir William Alexander (b. 1884). Prime Min. of Jamaica which gained independence in 1962; leader of the Jamaican Labour Party. Retired 1967.

Butler, Joseph (1692–1752), an English divine who occupied an important place among 18th cent. thinkers. He declined the Archbishopric of Canterbury in 1747, but in 1750 became Bishop of Durham. In 1736 he published his *Analogy of Religion*, a reply to the deistic attacks on revealed religion.

Butler, Dr. Nicholas Murray (1862–1947), President of Columbia University, 1902–45. A well-known publicist and internationalist and one of the most honoured and distinguished leaders in the world of education. Shared with Jane Addams (*q.v.*), the noted American sociologist, the Nobel Prize for Peace, 1931.

Butler, Richard Austen, Baron, C.H., P.C. (b. 1902), British statesman; Foreign Sec., 1963–4; First Min. of State, 1962–3; Dep. Prime Min., 1961–3; Home Sec., 1957–62; Chair. Cons. Party, 1959–61; Leader of the House of Commons, 1955–61; Chan. of the Exchequer, 1951–55; Min. of Education, 1941–45; and responsible for the Education Act, 1944. A member of the distinguished Cambridge family, son of Sir Montague Butler, Master of Pembroke. Took leading part in drafting various political charters setting out Conservative policy. Chancellor of Univ. of Sheffield (1959), of Essex (1964); Master of Trinity College, Cambridge (1965). Life barony conferred 1965.

Butler, Samuel (1612–1680), renowned as the author of *Hudibras*, one of the wittiest poems in the language and one of the most quoted. His last years were spent in poverty, and he was buried in the churchyard of St. Paul's, Covent Garden, and given a memorial in Westminster Abbey, "that he who was destitute of all things when alive might not want a monument when dead."

Butler, Samuel (1835–1902), author of the satirical novel *Erewhon* and its sequel *Erewhon Revisited*. Other works include *The Fair Haven* (1873), *Life and Habit* (1877), *Evolution Old and New* (1879), in which he attacked Darwinism. *The Way of All Flesh* and his famous *Notebooks* were published posthumously. Butler was a man of great originality and scholarship. He studied painting and exhibited regularly in the Academy and was also a musician.

Butt, Dame Clara, D.B.E. (1873–1936), the famous English contralto, made her début in London in 1892. She married Kennerly Rumford in 1900.

Buxton, Sir Thomas Fowell, 1st Bart. (1786–1845), a philanthropist and zealous advocate of the abolition of slavery.

Byrd, Rear-Admiral Richard Evelyn (1888–1957), famous American aviator and Polar explorer. Was in command of the Macmillan Arctic Expedition, 1925; flew over the North Pole, 1926; with three companions flew across the Atlantic, 1927, and in 1929 made the first flight over the South Pole. Discovered Edsel Ford mountains and Marie Byrd Land on his first expedition to the Antarctic, 1928–30. He made a second expedition in 1933–5, a third in 1939, and a fourth in December 1946.

Byrd, William (1543–1623), English writer of keyboard music and the greatest musician of the 16th century. He wrote church music, sacred choral music, string music, vocal and instrumental music, and founded the school of English madrigalists. He was organist of Lincoln Cathedral at 20 and later of Queen Elizabeth's Chapel Royal. *See* Section E.

Byron, George Gordon, 6th Lord (1788–1824), was the poet who exercised the greatest influence upon European thought during the early part of the 19th century. Educated at Harrow and Cambridge, he published his *Hours of Idleness* at twenty, a volume which was violently attacked by the *Edinburgh Review*

which provoked his retaliatory *English Bards and Scotch Reviewers*, which caused a great sensation because of its unsparing criticisms of the writers of the day. His *Childe Harold's Pilgrimage*, the first two cantos of which were published in 1812, at once placed him in the front rank of poets, and thenceforward to the time of his death he continued to produce poems, most of which were marked by an intense Republican sentiment, yet full of passion and charm and beauty. He made an unhappy marriage in 1815 with the daughter of Sir Ralph Milbanke, from whom he parted after a twelvemonth. He lived abroad for the rest of his life and died at Missolonghi, whither he had proceeded with a view to aiding the Greeks in their battle for national independence.

Cable, George Washington (1844–1925), a well-known American author, born in New Orleans, the scene of many of his best works. Among his writings were *Ole Creole Days* (1879), *Strange Stories of Louisiana* (1889), and serious sociological studies such as *The Negro Question* (1890).

Cabot, John (*c.* 1455–*c.* 1498), Genoese explorer who settled in Bristol and sailed westwards under letters-patent from Henry VII of England in 1497. Discovered Newfoundland and Nova Scotia, believing them to be part of Asia, and may have reached the mainland of America before Columbus did. His son:—

Cabot, Sebastian (*c.* 1483–1557) was born in Venice, and in 1509 sailed in search of a north-west passage to Asia. Sailed as far as the entrance of Hudson Bay. Entered Spanish service in 1512, and in 1518 was appointed chief pilot. Spent several years exploring the Plate and Parana rivers. Re-entered English service in 1548 and organised expedition to seek a north-east passage to open up trade with India, which resulted in trade with Russia. English claim to North America is founded on the voyages of the Cabots

Cabral, Pedro Alvarez (*c.* 1467–*c.* 1520). Portuguese navigator, friend of Vasco da Gama, and discoverer of Brazil, which he named "Terra da Santa Cruz."

Cadbury, George (1839–1922), was a prominent member of the Society of Friends, a well-known Philanthropist, and ardent Liberal, and head of the firm of Cadbury Bros., Bourneville. He took the lead in the Garden City project, and the village of Bourneville may be regarded as the first enterprise of the character to be practically completed; it has an endowment of over £200,000.

Cadogan, Rt. Hon. Sir Alexander, O.M., G.C.M.G., K.C.B. (b. 1884), entered the Diplomatic Service in 1908, and succeeded Lord Vansittart as permanent Under-Secretary of the Foreign Office in 1938. Helped to draft the Charter of the United Nations Organisation, and became Great Britain's first permanent representative on the Security Council. Chairman of the B.B.C., 1952–7.

Caedmon, the first English Christian poet, lived in the seventh century and, according to Bede, was first a cowherd and later a monk at Whitby. His poetry was based on the Scriptures.

Caesar, Caius Julius (*c.* 101–44 B.C.), Roman general. Was appointed successively military tribune, quæstor in 68, ædile in 65, and pontifex maximus in 63. A year later he was prætor, and later formed one of the first triumvirate. He invaded Gaul and Britain, in the Civil War defeated Pompey, and in the Alexandrine war met Cleopatra, and established her firmly on the throne of Egypt. On his return to Rome in 44 the crown was offered to him, a circumstance which caused the aristocratic party to compass his assassination.

Caine, Sir Thomas Henry Hall, C.H., K.B.E. (1853–1931), author of numerous novels, including *The Deemster*, *The Manxman*, *The Christian*, *The Prodigal Son*, *The Woman Thou Gavest Me*, the latter being one of the fiction sensations of 1913.

Calderón de la Barca, Pedro (1600–1681), a Spanish dramatist of great eminence whose plays number nearly 200. He was writer of court spectacles for Philip IV.

Calvin, John (1509–1564), one of the leading Reformers of the 16th century. Was born in Picardy and attained great popularity as a preacher in Paris, but was expelled, and subsequently lived at Geneva, where he continued to preach the new doctrine, giving it that special shape which resulted in the formation of the Calvinist body, distinguished by its greater austerity from that of the Lutherans. *See* J7.

Camden, William (1551–1623), an antiquary, historian, and master of Westminster School, whose researches, especially in the field of topography, have been of the greatest value. He became Clarencieux King-at-Arms, and was buried in Westminster Abbey. The Camden Society is named after him.

Cameron, Sir David Young, R.A. (1865–1945), was one of the best known of British etchers as well as an excellent landscape-painter. King's Painter and Limner in Scotland, 1933–45.

Cameron, Richard (*c.* 1648–1680), one of the Scottish 17th-century preachers who raised the standard of revolt in defence of the Solemn League and Covenant; he was, after many vicissitudes, slain in combat near Aird's Moss, Ayrshire, in 1680. The members of the Reformed Presbyterian Church were afterwards called Cameronians.

Cameron, Verney Lovett, C.B. (1844–1894), a noted African explorer who was the first to cross the African continent from east to west. Explored Lake Tanganyika, and made many valuable geographical discoveries. In 1872 went out to find Livingstone, and in 1873 met a party of natives bearing the dead body to the coast.

Camillus, Marcus Furius (446–365 B.C.), was five times Dictator of the Roman Republic, a supporter of the patrician order, and one of the most successful of the Roman generals. He died of the pestilence, 365 B.C.

Camm, Sir Sydney, C.B.E. (1893–1966), designer of the Hawker Hurricane Fighter aeroplane.

Cammaerts, Emile, C.B.E. (1878–1953), Belgian poet, critic, historian and dramatist. Born in Brussels, he settled in England in 1908, and became Professor of Belgian Studies and Institutions in the University of London. He became widely known during the war of 1914–18 for a series of Belgian poems.

Camões, Luis Vaz de (1524–1580), the author of *Os Lusiadas*, the great epic poem of Portugal, which sets forth the adventures of the discoverers of India, and celebrates the achievements of the principal personages in Portuguese history.

Campbell, Sir Colin. *See* **Clyde, Baron.**

Campbell, Sir Malcolm (1885–1948), the racing driver who held the land-speed record of 301 m.p.h. (1935) and water-speed record 141·7 m.p.h. (1939). His son Donald held the world water-speed record of 276·33 m.p.h. (1964). He was killed in 1967 at Coniston while attempting to set up a new speed record on water.

Campbell, Beatrice Stella (Mrs. Patrick Campbell) (1865–1940), was a celebrated actress. Her first London appearance was in 1890 in *The Hunchback*. She made her film debut in 1930 in *The Dancers*.

Campbell, Thomas (1777–1844), Scottish poet who at 22 published *The Pleasures of Hope*. He was one of the founders of University College, London, and is chiefly remembered for his war songs and the poems *Ye Mariners of England*, *The Battle of the Baltic*.

Campbell-Bannerman, Rt. Hon. Sir Henry, G.C.B. (1836–1908), Prime Minister in the Liberal Ministry from December 1905 until shortly before his death in April 1908. His Government at once faced a General Election and obtained a very large majority. Notable events of his period of office were the Trades Disputes Act, 1906, the Deceased Wife's Sister Act, 1907, and the simmering quarrel between the Liberals and the House of Lords, while the settlement of the South African problem was to a great extent due to his efforts. His Ministry contained a galaxy of talent—Grey, Haldane, Lloyd George, Asquith, Morley, Churchill—and was mainly held together by his personal popularity.

Camus, Albert (1913–60), important French writer, native of Algiers, whose works show the influence of existentialism. The Nobel Prize was awarded him in 1957 for "his important literary work, which has with penetrating seriousness thrown light on the problems of human conscience in our times." His most well-known novels are *l'Etranger* (1942), *La Peste* (1947), *l'Homme Révolté* (1952). Killed in car crash.

Canaletto, Giovanni Antonio (1697–1768), Venetian artist who excelled in the art of architectural painting. Some of his work is in the National Gallery, and there is a fine collection at Windsor.

Canning, Rt. Hon. George (1770–1827), entered Parliament in 1793 and became a great orator and a devoted adherent of Pitt, under whom he served first as Under-Secretary of State and later as Treasurer to the Navy. He was Secretary for Foreign Affairs under the Duke of Portland, and in 1827 became Prime Minister, but died four months later.

Cannizzaro, Stanislao (1826–1910), Italian chemist who carried forward the work of Avogadro in distinguishing between molecular and atomic weights. He was professor of chemistry at Alexandria, Geneva, Palermo, and Rome, became a member of the Italian senate, and did much to develop scientific education.

Canova, Antonio (1757–1822), an Italian sculptor, leader of the classical revival in Italy, whose works achieved the first eminence.

Canton, John (1718–72), English physicist and schoolmaster, the first to verify in England Franklin's experiments on the identity of lightning with electricity. He was the first to demonstrate that water is compressible and produced a new phosphorescent body (Canton's phosphorus) by calcining oyster shells with sulphur.

Canute the Great (995–1035), invaded England with a Danish force, and in 1013 succeeded in dethroning Ethelred the Unready, and setting up his own father, Sweyn, in Ethelred's stead. Sweyn dying in 1014, Canute claimed the crown, but it took him some years to establish himself firmly.

Capablanca, José Raoul (1888–1942), world's chess champion, 1921–27; defeated by Alekhine.

Caractacus was the name by which a Prince of ancient Britain became famed for his resistance to the Romans in the 1st century. He was ultimately captured and taken prisoner to Rome where the Emperor Claudius was so moved by his dignity of bearing that he pardoned him.

Carey, William, D.D. (1761–1834), the first Baptist missionary to proceed to India, and from 1800 to 1830 Professor of Oriental Languages at Fort William College, Calcutta. Became famed as an Oriental scholar, and published twenty-four different translations of the Scriptures.

Carissimi, Giacomo (1604–74), an Italian composer who is historically important for his development of the sacred cantata and the oratorio. Was maestro at Assisi, and later at Rome. The best collections of his works are in the National Library in Paris, and the Library of Christ Church, Oxford.

Carlyle, Thomas (1795–1881), was educated at Edinburgh University, and, after passing through some years of teaching drudgery, settled in London in 1824 and began the career of a serious man of letters; but, marrying Jane Welsh in 1826, he returned to Scotland and spent the next few years on a farm at Craigenputtoch, coming to London again in 1834. His *Sartor Resartus* was published in 1833. In 1837 he gave lectures in London, and in 1839 his *Chartism* appeared. His *French Revolution, Past and Present, Life and Letters of Oliver Cromwell, Latter-Day Pamphlets,* and *Frederick the Great* were works of noble conception.

Carnegie, Andrew (1835–1919), b. in Dunfermline, emigrated to America with his father in 1848, and after passing through much menial employment became connected with the Pennsylvania Railroad as Divisional Superintendent at Pittsburg, and ultimately established the Carnegie iron works, from which he retired in 1901 with a fortune of many millions. His munificent gifts for Free Libraries, educational work, and charitable objects are well known.

Carnot, General Lazare Nicolas Marguerite (1753–1823), was a prominent figure in the French Revolution, and author of an important work on fortification.

Caroline, Queen, wife of George IV. (1768–1821), was married to her husband in 1795 while he was Prince of Wales. The royal couple lived together only a very short time. When George succeeded to the throne in 1820 the Queen took steps to assert her position, and the King retaliated by having a Bill introduced to dissolve the marriage; the result was the famous trial before the House of Lords, when Lord Brougham distinguished himself by a most eloquent defence of the Queen. The Bill was passed by a narrow majority, but public feeling was too strong on the side of the Queen to admit of its being enforced.

Carrel, Dr. Alexis (1873–1944), American surgeon who won the Nobel Prize in 1912 for his remarkable achievements in suturing blood vessels and in the transplantation of organs. Member of the Rockefeller Institute for Medical Research 1906–44. A Frenchman by birth.

Carroll, Lewis. (*See* **Dodgson, Charles Lutwidge.**)

Carson of Duncairn, Lord, P.C. (1854–1935), had a highly successful career first at the Irish and then at the English Bar. Solicitor General for Ireland 1892; and for England 1900–6; Attorney General 1915; First Lord of the Admiralty 1917; Lord of Appeal 1921–29. Led a semi-militant organisation against the Home Rule Bill 1912–14.

Carter, Howard (1873–1939), Egyptologist and archaeologist who was associated with the 5th Earl of Carnarvon in discovering in 1922 the tomb of Tut-Ankh-Amen in the Valley of Kings, Egypt.

Cartier, Jacques (1494–1557), 16th-century navigator, born at St. Malo, whose exploration of Canada, and especially of the gulf and river of St. Lawrence, proved of great geographical importance.

Cartwright, Edmund, D.D. (1743–1823), invented the power loom, and also a wool-combing machine. Although these inventions were developed into fortune-making instruments, they benefited their inventor but little, and in 1809 Parliament made him a grant of £10,000. In 1904 a Cartwright Memorial Hall was opened at Bradford, the gift of Lord Masham.

Caruso, Enrico (1873–1921), a celebrated tenor, was born in Naples, and made his first operatic appearance in his native city. His success was unbounded.

Carver, George Washington (1864–1943), American negro agricultural chemist of world repute.

Casabianca, Louis de (c. 1754–1798), captain of the French flagship *L'Orient* at the Battle of the Nile. He and his ten-year-old son died together in the burning ship, refusing to quit the vessel.

Casals, Pablo (b. 1876), the famous Spanish violoncellist and conductor, who made his first appearance in Paris and London in 1898. He exiled himself from Spain in 1938 as a protest against dictatorship.

Cassatt, Mary (1845–1926), American painter and etcher. Spent most of her life in France, greatly influenced by the Impressionists and enjoyed friendship of Degas and Manet. Motherhood was her favourite subject.

Cassini, the name of a French family of Italian origin, distinguished for their services to astronomy and geography, who through four generations (1671–1793) were heads of the Paris Observatory.

Cassius, Caius Longinus, a distinguished Roman general who opposed the Dictatorship of Julius Cæsar, and took part in his murder. He died in 42 B.C., after being defeated by Mark Antony.

Castellani, Sir Aldo, Hon. K.C.M.G. (b. 1877), Italian scientist and foremost living authority on tropical diseases. Discovered the cause of sleeping sickness and other tropical diseases.

Castlereagh, Viscount, K.G., P.C. (1769–1822), British Minister of War and Foreign Secretary during the Napoleonic wars, who incurred much unpopularity because of the disastrous condition of home affairs. Succeeded to the Marquessate of Londonderry in 1821, and ended his life by suicide the following year.

Castro, Fidel (b. 1927), popular revolutionary hero of Cuba who came to power in 1959 with two main aims: (*a*) to end dictatorship, injustice and

poverty, and (b) to end dependence on America. Far-reaching agrarian reforms are in progress, but in fulfilling the second aim he has come into conflict with American interests.

Catherine, St., was the name borne by a celebrated virgin of Alexandria, who was put to death in 307 for professing Christianity, being, according to some accounts, tortured on a spiked wheel before execution, though other authorities aver that the intended torture was miraculously prevented. From this we get the term "St. Catherine's wheel." Festival 25 Nov.

Catherine of Aragon (1485–1536), first wife of Henry VIII., was previously the wife of Arthur, Henry's elder brother, who died shortly after the marriage. She was the daughter of Ferdinand and Isabella of Spain, aunt of the Emperor, Charles V, and mother of Mary Tudor. Henry's failure to obtain papal consent to the dissolution of their marriage precipitated the Reformation crisis in England.

Catherine the Great (1729–96), Empress Catherine II of Russia. Daughter of a Prussian general, she married in 1745 the future Peter III. a weakling, later deposed and murdered. Intelligent, cultivated, autocratic, she proved herself a capable ruler for a time but was hampered and opposed by the landed interests and, despite plans for reform, her reign was marked by imperialist expansion and extension of serfdom.

Catherine de' Medici (1519–1589), wife of Henry II. of France, and a woman of commanding power and influence, especially during her Regency, which continued while her son Charles IX. was in his minority. Her antagonism to the Protestants may have led to the Massacre of St. Bartholomew. In spite of her cruelty, she was an able woman, and showed a great appreciation of art and literature.

Cato, Marcus Porcius (234–149 B.C.) a Roman statesman, soldier, and writer, of strict virtue, simplicity and wisdom, who strongly condemned the luxury of his time and carried out his duties as Censor so rigorously that he became known as "Censorious."

Catullus, Caius Valerius (87–54 B.C.), an elegant Roman poet, whose lyrics to Lesbia are amongst the finest compositions of the kind in literature.

Cavell, Edith Louisa (1865–1915), a British nurse who assisted wounded British soldiers to escape over the Dutch frontier from Belgium during the Great War. She was shot by the Germans.

Cavendish, Hon. Henry, F.R.S. (1731–1810), English chemist and physicist who made researches into the nature of gases. Is chiefly remembered for his discovery of the chemical composition of water. He also discovered hydrogen (1766).

Cavour, Count Camillo Benso (1810–1861), a distinguished Italian statesman, who, as Premier to Victor Emmanuel, did much for the unification of Italy.

Caxton, William (1422–1491), was born in Kent and employed in commerce for a time. While visiting Flanders he obtained an insight into the then new invention of printing, and afterwards set up a printing-press of his own at Westminster.

Cecil of Chelwood, 1st Viscount, P.C., Q.C., C.H. (1864–1958), third son of the third Marquess of Salisbury. Took part in the Peace Conference, 1919, and helped to draft the Charter of the League of Nations. Awarded Nobel Prize for Peace, 1937.

Cecilia, Saint, the patron saint of music, martyred in Sicily under Marcus Aurelius (c. 176). She became patroness of music only about the beginning of the 15th century when painters showed her with harp, organ, or other musical instruments. Her festal day is Nov. 22.

Cellini, Benvenuto (1500–71), Italian sculptor and goldsmith of the later Renaissance. Possessed remarkable talent and skill, and produced innumerable works of great accomplishment, decorative and exquisite in detail, most of which have perished. Some examples are to be found in the Vienna Museum, the Louvre, and in the Metropolitan Museum. His famous bronze statue *Perseus with the Head of Medusa* can be seen in the Loggia dei Lanzi, Florence. His fame, however, rests more on his *Autobiography*, which gives a vivid account of the period and of his own craft.

Celsius, Anders (1701–44), Swedish physicist and astronomer who became professor of astronomy at Uppsala in 1730 and worked at the new Uppsala observatory, 1740–44. He invented the Centigrade or Celsius thermometer with freezing point of water at the zero-degree and boiling point at the 100-degree point.

Cervantes Saavedra Miguel de (1547–1616), Spanish novelist, dramatist, and poet, b. at Alcalá de Henares, famous throughout the world as the author of *Don Quixote*, a wonderful study of feudalism in decay in which is to be found much social science. He had a most adventurous career, taking part in many military expeditions, and not turning to literature until his retirement from the profession of arms. In spite of the great success of his work he died in poverty and two centuries went by before he was honoured.

Cézanne, Paul (1839–1906), an outstanding figure in the world of art; b. in Aix-en-Provence, the son of a wealthy banker and tradesman. He developed a highly original style, using colour and tone in such a way as to increase the impression of depth. He said that he wanted "to make of Impressionism something solid and durable, like the art of the Museums." Like Giotto, six hundred years before, he more than any other artist determined the course European painting was to take. *La Vielle au Chapelet* and *Les Grandes Baigneuses* may be seen at the National Gallery. He was a friend of Zola.

Chadwick, Sir James, F.R.S. (b. 1891), physicist, one of Rutherford's most brilliant collaborators in the field of atomic research. Discovered the neutron in 1932, one of the main steps in the discovery of the fission process which led to the production of the atom bomb.

Chagall, Marc (b. 1889), Russian painter, born at Vitebsk of Jewish parents, the forerunner of surrealism.

Chaliapin, Fedor Ivanovich (1873–1938), a world-famous Russian opera singer, a bass with great dramatic gifts.

Chamberlain, Rt. Hon. (Arthur) Neville (1869–1940), son of Joseph Chamberlain by his second wife. Prime Minister, 1937–40. His appeasement policy, which culminated in the Munich Agreement of 1938, has been the subject of much criticism.

Chamberlain, Rt. Hon. Joseph (1836–1914), did much active municipal work at Birmingham. In 1876 he entered Parliament, and at first was an enthusiastic Liberal with Republican tendencies and served in various offices under Mr. Gladstone. When the Home Rule split occurred, he became the most active member of the Liberal-Unionist party. In 1895 he accepted office as Secretary of State for the Colonies under Lord Salisbury, and in that post won a great reputation, notwithstanding the fact that during his term of office he had the Boer War to contend with. In May, 1903, he caused great sensation by suddenly advocating a scheme of fiscal reform, involving a partial return to Protection. This policy was afterwards adopted as one of the leading planks of the Unionist platform.

Chambers, Sir William, R.A. (1726–1796), a British architect, who rebuilt Somerset House in 1775. He also laid out Kew Gardens and designed the Pagoda there.

Chaminade, Cécile (1857–1944), French pianist and composer of orchestral music, ballets, songs, and charming piano pieces.

Champlain, Samuel de (1567–1635), a French navigator who founded Quebec in 1608, and in the following year discovered the lake known by his name.

Chantrey, Sir Francis Legatt, R.A. (1781–1842), a renowned English sculptor who contributed many fine statues to Westminster Abbey and St. Paul's. His famous "Sleeping Children" tomb is in Lichfield Cathedral. He left a considerable fortune to the Royal Academy for the purchase of works of art executed in Gt. Britain. The collection is in the Tate Gallery.

Chaplin, Charles Spencer (b. 1889), the first international screen star and one of the world's greatest artists, b. in South London. His mother was a music-hall singer and he made his stage début at the age of five. In 1910 he went to the United States and there attracted the attention of Mack Sennett. It was with the Keystone Company in Los Angeles (1914–15) that he created the unforgettable figure with the minute moustache and the baggy trousers.

His most famous films include *The Tramp*, *Shoulder Arms*, *The Kid*, *The Gold Rush*, *The Circus*, *City Lights*, *The Great Dictator*, *Modern Times*, *Monsieur Verdoux*, and *Limelight*. In 1953 he decided to leave America and live in Switzerland. He is an English citizen. *My Autobiography* was published in 1964.

Chapman, Sydney, M.A., D.Sc., F.R.S. (b. 1888), mathematician and geophysicist: Chief Prof. of Mathematics, Imperial College of Science, 1924–46; Pres. Int. Comm. which organised the International Geophysical Year, 1957–8.

Chapman, George (1559–1634), an Elizabethan dramatist, who acquired more fame by his translation of Homer than by his plays. Keats's sonnet *On Reading Chapman's Homer* is a splendid tribute to the old dramatist.

Charcot, Dr. Jean Baptiste Etienne Auguste (1867–1936), a famous French explorer, who in 1903–05 and 1908–10 commanded expeditions which carried out important work in mapping, sounding, etc., in the South Polar regions. Charcot Island in the Antarctic Ocean, which he discovered in 1905, is named after him.

Chares (*c.* 300 B.C.), sculptor of the Colossus of Rhodes, a gigantic bronze statue of the sun-god, and one of the seven wonders of the world, destroyed in the earthquake of 224 B.C.

Charlemagne ("Charles the Great") (742–814), a wise and powerful ruler, general and statesman, who from being King of the Franks became Emperor of the Romans, and governed an empire comprising Gaul, Italy, and large parts of Spain and Germany.

Charles, Jacques Alexandre César (1746–1823), French physicist, the first to use hydrogen gas in balloons and who anticipated Gay-Lussac's law of the expansion of gases on heating.

Charles Edward (Stuart) (1720–1788), the "Young Pretender" as he came to be called, grandson of James II., and the hero of 1745, lived in exile after Culloden, and his later career was mainly one of dissipation.

Charles I. (1600–1649), King of England, Scotland, and Ireland (1625–49), succeeded his father James I. in 1625. His marriage to the Catholic princess, Henrietta Maria, sister of Louis XIII. of France, displeased the English public. He was in continual trouble with his ministers and parliament; Cromwell's career began in his reign. He was beheaded in front of the Banqueting House at Whitehall, Jan. 30, 1649.

Charles II. (1630–1685), King of England, Scotland, and Ireland (1660–85), eldest surviving son of Charles I. After defeat by Cromwell at Worcester (1651) escaped to France; restored to throne 1660. During his reign Pepys was recording the great London plague of 1665, and the fire of 1666, Wren was building St. Paul's, John Bunyan was writing *Pilgrim's Progress* and Milton *Paradise Lost*, Newton was a fellow of the Royal Society (founded by Charles) and England was becoming a great sea power. Famed as the "Merry Monarch" because of his pleasure-loving ways. Dabbled in chemistry and probably died of mercury poisoning.

Charles V. (1500–1558), Hapsburg ruler, succeeded his grandfather, Maximilian I, as emperor of the Holy Roman Empire, and as heir to Ferdinand and Isabella succeeded to Spanish Crown. Administering such vast dominions involved him in many struggles: rivalry with Francis I of France led to four wars. Crushed revolt of peasants (1525). Augsburg settlement (1553) brought Lutherans religious equality with Roman Catholics. Retired to a monastery in Spain (1557).

Charles XII of Sweden (1682–1718), a brave but impulsive monarch whose reign was distinguished by the great Nordic War against Denmark, Poland, and Russia. Peter the Great decisively defeated him at Poltava in 1709. In 1718 he invaded Norway and was killed while besieging the fortress of Fredrikshald.

Chateaubriand, François René, Vicomte de (1768–1848), French writer and diplomat who in the midst of an adventurous and somewhat eccentric political career wrote a number of stories, poems, and essays which reflect the richness of his personality and give him a unique place in French literature. He was the friend of Mme Récamier for many years. His last years were spent in writing *Mémoires d'outre-tombe* (memoirs from beyond the tomb).

Chatham, William Pitt, Earl of (1708–1778), had a long and distinguished career as a statesman, and was the most eloquent Parliamentarian of his time. In the long conflict with France that preceded the American War of Independence, Chatham showed great resourcefulness and vigour, but his patriotic efforts were of little avail against the obstinacy of the King and his party, and he ultimately retired from contention, only making a last appearance in the House of Lords to urge a greater resistance to the war with the American Colonists, and, after a powerful speech, fell back in an apoplectic fit and died a few weeks later, being buried in Westminster Abbey.

Chatterton, Thomas (1752–1770), young English poet of remarkable talent, unappreciated until after his death. Unsuccessfully tried to pass off his writings as newly discovered ancient manuscripts and killed himself at the age of 17.

Chaucer, Geoffrey (*c.* 1343–1400). Achieved immortality by his *Canterbury Tales*, giving a most graphic description of the life and characters of his time. He was buried in Westminster Abbey.

Chekhov, Anton (1860–1904), Russian dramatist and short-story writer, whose plays *The Cherry Orchard*, *Uncle Vanya*, and *The Three Sisters* continue to delight modern audiences.

Cherubini, Maria Luigi Carlo Zenobia Salvatore (1760–1842), a Florentine musician, for many years director of the Paris Conservatoire and composer of operas and church music. Admired by Beethoven and Mendelssohn.

Chesterfield, Earl of, K.G. (1694–1773), English statesman whose fame rests upon the letters to his natural son, Philip Stanhope, under the title *Letters to his Son*, which are full of grace, wit, and worldly wisdom.

Chesterton, Gilbert Keith (1874–1936), English essayist and novelist; contributed to the *Illustrated London News*, etc., and kept himself in evidence in many literary and journalistic quarters; handled social questions, art, politics, and criticism with dexterity and audacity. Published studies of Robert Browning and Charles Dickens. Completed his autobiography shortly before he died.

Chevalier Albert (1861–1923), English music-hall comedian of great originality; celebrated for his coster sketches and songs.

Chevalier, Maurice (b. 1888), French stage and film actor.

Chiang Kai-shek, Generalissimo (b. 1887), former President of China and member of the Kuomintang Party. Emerged from the welter of events succeeding the death of Sun Yat Sen in 1925 as the leading man in China, a position he maintained for a quarter of a century of trouble and bloodshed until the collapse of the Kuomintang régime in 1949. *See also* Section C, Part I.

Chichester, Sir Francis, K.B.E. (b. 1902), English seaman, who after a long career of feats at the helm and in the air sailed his *Gipsy Moth IV* into Sydney Harbour in Dec. 1966 after a 107-day voyage from Plymouth. He was knighted on the eve of his return round the Horn.

Chippendale, Thomas (*c.* 1717–1779), a celebrated designer of furniture, born in Otley, Yorkshire. His *The Gentleman and Cabinet Maker's Director* (1752) shows the wide variety of domestic furniture made in England at that time.

Chirico, Giorgio de (b. 1888), painter associated with surrealism, born in Greece of Italian parents.

Chopin, Frédéric François (1810–1849), Polish pianist and composer, son of a French father and Polish mother. He has been called "the poet of the piano" because of the originality and delicacy of his playing. His music, composed mostly for the piano, includes preludes, mazurkas, impromptus, nocturnes, études, sonatas, and a barcarolle and a berceuse. He enjoyed Paris intellectual and musical society, and played in numerous concerts all over Europe. He died of consumption and was buried in Père-Lachaise, next to his friend Bellini.

Chou-En-lai, General (b. 1898), Prime Minister of the Chinese People's Republic since 1949; Foreign Min. 1949–58. Took important part in Geneva Conference of 1954, where his talents for negotiation helped to bring to an end the 8 years' war in Indo-China and the new China into world diplomacy.

Chrysostom, St. John (347–407), a father and

saint of the Greek Church who was made Archbishop of Constantinople and was famous for his eloquent preaching and persuasive writing.

Churchill, Rt. Hon. Lord Randolph (Henry Spencer), P.C. (1849–1895), was the third son of the seventh Duke of Marlborough. Entered Parliament in 1874, and four years later became prominent on the Conservative side for his scathing attacks on what he called the "Old Gang" of his own Party, and was one of Mr. Gladstone's most severe critics. In 1885 he became Secretary for India, and in the following year was Chancellor of the Exchequer and Leader of the House of Commons, but after a few months of brilliant work resigned on a difference of opinion with his colleagues.

Churchill, Rt. Hon. Sir Winston (Leonard Spencer), K.G., O.M., C.H., C.L., (1874–1965), British statesman, soldier, and author, son of the last-named. He entered Parliament in 1900 and represented Oldham, 1900–06; N.W. Manchester, 1906–08; Dundee, 1908–22; Epping, 1924–45; Woodford, 1945–64. He served as a junior officer with the British force during the Indian frontier troubles of 1897–98 and in the Sudan Campaign, and during the Boer War as a war correspondent he had many dramatic adventures. He held the following ministerial posts: Under-Secretary for the Colonies, 1905–08; President of the Board of Trade, 1908–10; Home Secretary 1910–11. First Lord of the Admiralty, 1911–15 and 1939–40. Chancellor of the Duchy of Lancaster, 1915. Minister of Munitions, 1917; Minister of War, 1918–21; Minister of Air, 1919–21. Sec. of State for the Colonies, 1921–22. Chancellor of the Exchequer 1924–29; Prime Min. and Min. of Defence, 1940–45; Prime Min. 1951–55. Lord Rector of Aberdeen University, 1914–18; Lord Rector of Edinburgh University, 1929–32; Chancellor of Bristol University, 1930; Lord Warden of the Cinque Ports. A man of action, cast in the heroic mould, he lived a full and adventurous life, and will be remembered as the inspired war leader who expressed the determination of the British people to defeat Hitler. His numerous writings include a biography of his famous ancestor, Marlborough, and stories of the First and Second World Wars. He exhibited at the Royal Academy and was elected Academician Extraordinary in 1948. Hon. American citizenship conferred, 1963. Awarded Nobel Prize for Literature in 1953.

Chulalongkorn, Phra Paramindr Maha (1853–1910), great Siamese monarch whose appreciation of foreign institutions inspired him to carry out many reforms in his country.

Cibber, Colley (1671–1757), a London actor and dramatist of great repute in his day. *The Careless Husband*, and *Love's Last Shift* are the best of his comedies. Poet Laureate 1730–57.

Cicero, Marcus Tullius (106–43 B.C.), a Roman Republican orator and philosopher. His younger brother, Quintus Tullius Cicero (102–43 B.C.), was a Roman soldier of some note. Both were slain.

Cid (El Campeador) (c. 1035–1099), the name given to the famous Spanish knight, Rodrigo Diaz, Count of Vivar, whose exploits in battle and adventure made him the national hero. He drove the Moors out of Spain before he had completed his twentieth year.

Cierva, Juan de la (1895–1936), the Spanish engineer who invented the autogiro.

Cimabue, Giovanni (1240–1302), a Florentine painter whose real name was Cenni di Pepo, master of Giotto, and the leader of the movement which led to the formation of what is called the Florentine school.

Cimarosa, Domenico (1749–1801). One of the earliest Italian composers whose works in his time were as popular as they were numerous. Was composer to the Russian Court from 1789 to 1792. His most popular opera during his lifetime was *Il Matrimonio Segreto*, and it is still to-day the most frequently heard of his works.

Cimon (c. 507–449 B.C.), Athenian statesman and general, son of the great Miltiades who commanded at Marathon. He worked for friendship with Sparta to unite forces against Persia. Decisively defeated Persian land and sea forces at the mouth of the Eurymedon in 468 B.C. Died at the siege of Citium, in Cyprus.

Cipriani, Giovanni Battista (1727–85), Florentine painter and engraver who worked in London and was one of the foundation members of the Royal Academy. Collections of his pen-and-ink drawings are in the British Museum and Victoria and Albert Museum.

Citrine, 1st Baron P.C., G.B.E. (b. 1887), English trade-union official who rose to a prominent position in the Electrical Trades Union, of which he was Asst. Gen. Sec., 1920–23; Pres. Int. Fed. of Trade Unions, 1928–45; Gen. Sec. Trades Union Congress, 1926–46; Mem. Nat. Coal Board, 1946–47; Chair. Central Electricity Authority, 1947–57.

Clair, René, (b. 1898), French film producer, whose early films, full of wit and satire, included *Sous les Toits de Paris* and *A Nous la Liberté*.

Clarendon, Edward Hyde, 1st Earl of (1609–1674), a statesman of great ability who filled the office of Lord High Chancellor under Charles II., and for a time was in high favour but, refusing to pander to Charles's whims, was dismissed and went to live in retirement. His *History of the Rebellion* is a valuable work, having the advantage of being written by one who was a witness of, and often an important figure in, the events described. His daughter Anne was the wife of the Duke of York, afterwards James II., and it was her daughter who became Queen Anne. Clarendon died in exile at Rouen.

Clark, Sir Kenneth McKenzie, C.H., K.C.B. (b. 1903), British art critic. Director, National Gallery, 1934–45; Chairman Arts Council of Great Britain, 1953–60; Chairman, Independent Television Authority, 1954–57. His broadcasts on art and architecture are much enjoyed.

Clark, Sir Wilfred Edward le Gros, M.A., M.D., D.Sc., F.R.C.S., F.R.S. (b. 1895), anatomist and anthropologist; Prof. of Anatomy, Oxford Univ., 1934–62; one of the scientists to expose the forgery of the Piltdown skull. Pres. British Association, 1961.

Clarke, Marcus Andrew Hislop (1846–81), Australian novelist, born in London. Emigrated to Australia in 1863, where he became a journalist. During his stay in Tasmania he wrote *For the Term of his Natural Life*, which has become a minor classic.

Clarkson, Thomas (1760–1846), was one of the leaders of the Negro Emancipation movement, to which he devoted the main part of his life.

Claude Lorrain (1600–1682), the most famous landscape painter of his century. His real name was Claude Gelée, and he was born at Chamange in the Vosges, going from France to Rome as a lad and there laying the foundation of his worldwide celebrity. He lived in Rome most of his life.

Claudius I. (10 B.C.–A.D. 54), Emperor of Rome, who succeeded his nephew Caligula when he was murdered. He was the grandson of Tiberius Claudius Nero, erected many imposing buildings in Rome, and visited Britain. In his later years he became the tool of favourites, and was poisoned by his wife Agrippina.

Clausewitz, Gen. Carl von (1780–1831), Germany's greatest military expert. His classic book *Vom Kriege*, which expounds his theories on war, dominated Prussia in the nineteenth century, and is still studied in military schools throughout the world.

Clemenceau, Georges Eugène (1841–1929), a prominent French statesman and editor of strong Radical tendencies who supported General Boulanger for a time and then bitterly opposed him. Was still a leading exponent of French Radicalism, though he sacrificed his independent position to become Premier and Minister of the Interior in October, 1906–1909. Prime Minister and Minister for War, France, 1917–20. Was a great orator, and a sturdy defender of Dreyfus.

Clemens, Samuel Langhorne ("Mark Twain") (1835–1910). After the Civil War drifted into journalism, making himself popular as a humorist in 1869 by his *Innocents Abroad*, the result of a trip to Europe. His other works include *A Tramp Abroad*, *Tom Sawyer*, *Huckleberry Finn*, and *Pudd'nhead Wilson*.

Cleopatra (69–30 B.C.), daughter of Ptolemy XI, the sixth queen of Egypt by that name, a brilliant, ambitious woman of captivating charm. On the death of her father in 51 she became

sovereign with her younger brother ______ XII, whom she married in accordance with Egyptian custom. She was banished to Syria, but obtaining the help of Cæsar, led a revolt and won the kingdom for herself. Cleopatra and Cæsar became lovers. In 47 she bore him a son Cæsarion (later Ptolemy XIV) and followed him to Rome. After the murder of Cæsar she returned to Egypt, where in 41 she was summoned to meet the triumvir Mark Antony. He fell in love with her and became enslaved. She bore him twins Alexander Helios and Cleopatra Selene. He deserted Octavia his wife and broke with Octavian (later Augustus), his brother-in-law, in an attempt to re-establish the power of Egypt. Antony and Cleopatra were, however, defeated at Actium in 31 B.C. and at Alexandria. Antony fell upon his sword, and Cleopatra, unable to influence Octavian, killed herself by allowing an asp to bite her. The drama of her life has been described by Shakespeare in *Antony and Cleopatra* and by Shaw in *Cæsar and Cleopatra*.

Clive, Robert, Lord (1725–1774), went out to India as a clerk in the service of the East India Company when 17, and during the diplomatic difficulties which arose between England and France attracted the attention of his superiors by some able suggestions for the curbing of the French influence. In the war that followed he was given a command and displayed such remarkable military genius that he virtually became Commander-in-Chief. In the troubles that followed with the native rulers, he was equally resourceful, and succeeded in laying the foundation of the British empire in India on a secure basis.

Clovis (*c.* 465–511) was the founder of the Merovingian-line of Frankish kings, and a convert to Christianity. He defeated the Burgundians and West Goths, and fixed his court at Paris.

Clyde, 1st Baron, Colin Campbell, K.C.B. (1792–1863), a British Field-Marshal who served in the Peninsular and Crimean wars and made a great reputation as Commander-in-Chief in India during the Mutiny.

Cobbett, William (1763–1835), a politician and controversialist, who, through the medium of his *Political Register*, attacked both Radical and Tory in turn. Entered Parliament in 1832. In 1830 his *Rural Rides* were published in book form.

Cobbold, 1st Baron, Cameron Fromanteel, P.C., G.C.V.O. (b. 1904), Governor of the Bank of England, 1948–61; Lord Chamberlain, 1962– .

Cobden, Richard (1804–1865), the son of a Sussex farmer, who during the Corn Law Agitation came into great prominence as an advocate of Free Trade. He devoted himself so completely to this cause, that for some years he entirely neglected his business affairs and in recognition of his services a subscription of £80,000 was raised for him in 1845, and in 1860 a further sum of £40,000. He entered Parliament in 1841, and except for an interval of two years remained a member till his death. Titles and other honours were offered to him but declined.

Cochran, Sir Charles Blake (1872–1951), a prominent English theatrical manager and producer who began as an actor in America. Among his many successes were *Bitter Sweet*, *Cavalcade*, and a number of brilliant revues.

Cockcroft, Sir John Douglas, K.C.B., O.M., C.B.E., M.A., Ph.D., F.R.S. (1897–1967), Cambridge nuclear physicist who shared with Dr. E. T. S. Walton the 1951 Nobel Prize. They had worked together at Cambridge in the historic "atom-splitting" experiments beginning with the transmutation of lithium into boron. Dir. Atomic Energy Research Estab. at Harwell, 1946–58. As Member (Research) U.K. Atomic Energy Authority, 1958–59, he was directly involved in Britain's first nuclear power programmes. Master of Churchill College, Cambridge.

Cockerell, Christopher, C.B.E., M.A. (b. 1910), British inventor of the hovercraft. *See* Hovercraft, Section L.

Cocteau, Jean (1891–1963), French writer and artist whose achievements in widely varied forms of art were prodigious. Elected to the Académie Française in 1955.

Cody, Samuel Franklin (1861–1913), American aviator whose name is associated with flights at Farnborough, Hampshire, England. He was the first man to fly in Britain (1,390 feet on 16 Oct. 1908). He became a British subject in 1909. Killed while flying.

Cody, William Frederick (1846–1917), American showman, known as "Buffalo Bill," who in 1883 founded his great Wild West Show with which he toured America and Europe for many years.

Cohn, Ferdinand Julius (1828–1898), the famous German bacteriologist, of which science he was the virtual founder.

Coke, Sir Edward (1552–1634), Attorney-General under Elizabeth and Chief Justice under James I; great rival of Francis Bacon. His extensive legal erudition added many new interpretations to the Common Law system. Among his publications are his four *Institutes*, the first of which (*Coke upon Littleton*) is very famous.

Colbert, Jean Baptiste (1619–83), French statesman, who fostered new industries and encouraged commerce, endeavoured to reform the finances, and established the French Navy on a sound basis. A patron of literature, science, and art.

Cole, George Douglas Howard, M.A., (1889–1959), British economist, sociologist, and writer; Chichele Professor of Social and Political Theory at Oxford, 1944–57; Chairman Fabian Society, 1939–46; Pres. Int. Society for the Study of Socialism from 1956 until his death. Among his numerous writings on social and economic problems are *The Intelligent Man's Guide through World Chaos* (1932), *The Post-War Condition of Britain* (1956), *The Case for Industrial Partnership* (1957), *A History of Socialist Thought* (5 vols.).

Coleridge, 1st Baron (1820–94), Lord Chief Justice of England from 1880 until his death. Was a distinguished scholar, orator and barrister, his most famous case being the Tichborne trial in 1871, when his speech for the defence lasted 23 days.

Coleridge, Samuel Taylor (1772–1834), one of the great poets of the early part of the 19th century, whose *Ancient Mariner* and a few other poems stand unsurpassed for poetic beauty and originality.

Coleridge-Taylor, Samuel, A.R.C.M. (1875–1912), British composer, the son of a West African negro doctor practising in London, and an Englishwoman. He studied at the Royal College of Music where his *Hiawatha's Wedding Feast* was performed in 1898.

Colet, John (*c.* 1467–1519), humanist and divine, founded St. Paul's School, 1512. As scholar and friend of Erasmus he helped to bring the New Learning to England.

Colette (Sidonie Gabrielle Claudine Colette) (1873–1954), author of a number of highly successful novels including the famous *Claudine* stories, *Chéri* and *La Fin de Chéri*. Grand Officier de la Légion d'Honneur (1953).

Collier, Hon. John (1850–1934), English painter who became highly popular for his "problem" pictures. He is best remembered, however, as a distinguished portraitist.

Collingwood, Lord (1750–1810), British admiral whose ship the *Royal Sovereign* led the fleet to battle at Trafalgar and who on Nelson's death assumed the command.

Collins, Michael (1890–1922), brilliant and daring Irishman, leading spirit of the Sinn Fein political movement. Took part in the Easter Rebellion and organised the guerilla warfare which eventually led to the breakdown of British government and to the Anglo-Irish Peace of Dec. 6, 1921. Killed in ambush by Republicans after his return from England.

Collins, William, R.A. (1788–1847), a noted landscape and figure painter, and father of Wilkie Collins.

Collins, William Wilkie (1824–1889), the novelist, was for many years associated with Charles Dickens, and wrote *The Dead Secret*, *The Woman in White*, and *No Name*.

Colt, Samuel (1814–1862), of Hartford, Connecticut, invented the revolver and patented it in 1835. It was some time before its utility was recognised, but after being used with great effect in the war with Mexico it was universally adopted.

Columba, St. (521–597), the founder of the monastery of Iona, was a native of Ireland. From his lonely island shrine he made frequent missionary journeys to the Highlands of Scotland

where he made many converts and was greatly revered.

Columbus, Christopher (c. 1446–1506), the famous Italian navigator, who, prevailing upon Ferdinand and Isabella of Spain to bear the expense of an expedition of discovery, set out on his first voyage in 1492. He first discovered the Bahamas, Cuba, and other West Indian islands, and, on his third voyage, in 1498, landed on the lowlands of South America.

Comenius, Johann Amos (1592–1670), famous Czech educationist. Was the first advocate of the "direct" method of teaching languages, of the use of pictures in education, and of the teaching of science.

Compton, Arthur Holly (1892–1962), American physicist whose work on X-rays led to the discovery of the so-called "Compton Effect," for which he shared with C. T. R. Wilson the 1927 Nobel Prize for Physics. He also made important cosmic-ray investigations and helped to develop the atomic bomb. His brother Karl Taylor Compton (1887–1954) was also a physicist who did important research on radar and the ionisation of gases.

Compton-Burnett, Ivy, D.B.E., British novelist, whose books deal with family relationships and include *Men and Wives*, *A House and its Head*, *Man Servant and Maid Servant*, *The Present and the Past*, *A Heritage and its History*. *See* Contemporary Novel, Section M.

Comte Auguste (1798–1857), French philosopher; founder of positivism, and father of social philosophy. *See* Positivism, Section J.

Condé, Louis II., de Bourbon, Prince de, "The Great Condé" (1621–1686), was a distinguished military commander. Victor of Rocroi, 1643.

Confucius (c. 551–479 B.C.), Chinese philosopher and sage, founder of the great world religion of Confucianism. He was not concerned with the supernatural but appealed to reason and taught love and respect of one's fellows, superiority to ambition, charity, forgiveness, and repentance. (*See* Confucianism, Section J.)

Congreve, William (1670–1729), was a famous Restoration dramatist, whose comedies of manners reflect the grossness of his age only too closely, but are redeemed by the brilliancy of his wit. He was buried in Westminster Abbey.

Conrad, Joseph (1857–1924), English novelist of Polish birth whose parents were exiled to France for political reasons. He became master mariner in the British merchant service and began to write novels after he left the sea in 1884. He has a beautiful prose style and is acknowledged to be a significant figure in English literature. His novels include: *Almayer's Folly* (1895), *Lord Jim* (1900), *Nostromo* (1904).

Conscience, Hendrik (Henri) (1812–83), the famous Flemish novelist whose historical romance, *The Lion of Flanders*, earned him a distinguished place in the world of literature.

Constable, John, R.A. (1776–1837), was a native of East Bergholt, Suffolk, and became one of the greatest of English landscape painters. He had long to wait for recognition, but ultimately attained high honour and exerted a strong influence in the development of landscape art.

Constant, Jean Joseph Benjamin (1845–1902), French portrait and subject painter; *Prisoners in Morocco*, *The Harem*, and *The Emir's Favourite* are among his celebrated Oriental pictures.

Constantine the Great (c. 272–337). Emperor of Rome from 306 to his death. Transferred the Capital of the Empire from Rome to Byzantium, thence called Constantinople after his name.

Constantine I. (1868–1923), King of Greece, 1913–17, and 1920; married Princess Sophia of Prussia, sister of the Kaiser.

Cook, James (1728–79), celebrated English navigator, son of an agricultural labourer. He entered the Royal Navy and gained a high reputation for his scientific skill. He made successful voyages of discovery in the ships under his command, *Endeavour*, *Resolution* and *Adventure*, adding greatly to our knowledge of the Pacific and the Antarctic. He also made an attempt to find the North-West Passage. He was murdered on the island of Hawaii.

Cooper, Sir Astley Paston, Bt., F.R.S. (1768–1841), one of the greatest surgeons of his time, and the author of several important medical textbooks.

Cooper, James Fenimore (1789–1851), was a very popular American novelist, who from about 1820 to the time of his death produced a succession of stirring stories of adventure, which enjoyed much popularity, among them *The Spy*, *The Last of the Mohicans*, *The Pathfinder*, and *The Deer Slayer*.

Cope, Sir Arthur Stockdale, K.C.V.O., R.A. (1857–1940), was a well-known portrait painter.

Copernicus, Nicholas (1473–1543), founder of modern astronomy, was born at Thorn on the Vistula, then under Polish suzerainty. Studied at Cracow and in Italy, lectured on astronomy and mathematics at Rome and in 1512 settled at Frauenburg, where he was canon of the cathedral. He also practised medicine. His beliefs concerning the universe were set forth in his great book *De revolutionibus orbium coelestium*, which was not published until his death for fear of the storm his revolutionary theories would raise. In it he proved that the planets, including the earth, revolve round the sun.

Coppée, François Joachim (1842–1908), French poet, dramatist and novelist.

Coquelin, Benoit Constant (1841–1909), eminent French actor ("Coquelin aîné"), and **Coquelin, Ernest** ("Coquelin cadet"), his youngest brother (1848–1909), were leading lights of the Théâtre Français.

Corelli, Arcangelo (1653–1713), Italian composer and the first great violinist to enjoy universal fame; founded the present art of violin playing and gave definitive form to the *concerto grosso*.

Corneille, Pierre (1606–1684) the French tragic dramatist, whose *Cid*, *Polyeucte*, *Le Menteur*, and other plays marked a new era in French dramatic production.

Cornwallis, 1st Marquess (1738–1805), commander of the British forces which surrendered to the Americans, at Yorktown in 1781, thus ending the War of Independence; was twice Governor-General of India.

Corot, Jean Baptiste (1796–1875), a French landscape painter of great repute.

Correggio, Antonio Allegri da (1494–1534), the great Italian painter of the Lombard School, whose "Ecce Homo" is in the British National Gallery.

Cortes (or **Cortez**), **Hernando** (1488–1547), a Spanish adventurer who earned great renown by capturing Mexico for Spain, and held that country in subjection for ten years.

Cortot, Alfred (1877–1962), French pianist and conductor, best known for his playing of Chopin, Liszt, and Schumann; chorus director at Bayreuth; conducted first complete performance in Paris of Wagner's *Ring*.

Cosgrave, William Thomas (b. 1880), President of Executive Council, Irish Free State, 1922–32; Finance Min., 1923; Defence Min., 1924; Parl. Chairman Fine Gael, 1933–44.

Costello, John A., S.C. (b. 1891), Prime Minister of Irish Republic 1948–51 and 1954–57. When Attorney General, Irish Free State, 1926–32, helped to draft the Statute of Westminster.

Coulton, George Gordon, Litt. D., LL.D. (1858–1947), scholar and historian of the Middle Ages, whose main claim to fame rests upon *Five Centuries of Religion*, works in which he set forth his interpretation of monastic history in England from the Conquest to the Reformation.

Couperin. A notable family of French musicians who were organists at St. Gervais, Paris, from about 1650 until 1826. **François Couperin** (1668–1733), called "Couperin the Great," is the best known today for his harpsichord music.

Cousin, Victor (1792–1867), French educationist and philosopher, founder of the eclectic school. He was a remarkable lecturer and his writings cover nearly the whole field of philosophy.

Cousins, Samuel, R.A. (1801–1887), the greatest mezzoprint engraver of his day, whose plates after Reynolds, Millais, Landseer, and Hogarth reach the highest point of this kind of art work.

Cousteau, Jacques-Yves (b. 1910), French underwater explorer, pioneer of aqualung diving, whose research into the feasibility of humans living in undersea "villages" has aroused wide interest.

Couve de Murville, Maurice (b. 1900), French diplomat who has been Foreign Minister since Gen. de Gaulle's return to power in 1958. He lost his seat in the 1967 general election.

Coverdale, Miles (1488–1568), one of the early English Reformers, was born in Yorkshire, and afterwards became a monk of Norwich and

later Bishop of Exeter. He collaborated with Tyndale in translating the Bible; the Psalms still used in the Prayer Book are taken from their translation.

Coward, Noel (b. 1899), a successful English playwright and actor. His works include *Hay Fever*, *Private Lives*, *Blithe Spirit*, the operetta *Bitter Sweet* and the films *In Which We Serve*, *This Happy Breed*, and *Brief Encounter*.

Cowper, William (1731–1800), an English poet imbued with much piety of sentiment and a remarkable poetic talent. His *Task* is one of the great poems of the 18th century.

Cox, David (1783–1859), an eminent landscape painter—son of a Birmingham blacksmith—whose pictures are thoroughly English in spirit and treatment.

Crabbe, Rev. George (1754–1832), a poet of rural life and scenes, noted for his faithful pictures, characterisation and soundness of his sentiments.

Craig, Edward Gordon, C.H. (1872–1966), the son of Ellen Terry, author of several books on stagecraft. He produced many plays in England and on the Continent.

Cranmer, Thomas (1489–1556), Archbishop of Canterbury under Henry VIII, and Edward VI.; an ardent promoter of the Reformation. On Mary's accession at first consented to return to the old faith, but when called upon to make public avowal of his recantation, refused, and was burnt at the stake. His great contributions were the English Bible and Book of Common Prayer.

Crichton, James (1560–1582). Scottish adventurer who earned considerable renown for his scholarly accomplishments and charm and was called "The Admirable Crichton." He was assassinated when only twenty-two years of age in Mantua.

Cripps, Rt. Hon. Sir (Richard) Stafford, C.H., Q.C. (1889–1952), British statesman and barrister, younger son of Lord Parmoor and nephew of Beatrice Webb. In charge of post-war Britain's economic affairs. His programme was one of purposeful austerity, but his outstanding ability and masterly exposition of the economic situation won him support from all sides. He showed that liberty and planning can be reconciled in the modern world. Labour M.P. for S.E. Bristol, 1931–50. Gave up a brilliant career at the bar to enter politics. Ambassador to Moscow, 1940–42, and Min. of Aircraft Production, 1942–45. Went on missions to India in 1942 and 1946. Resigned his seat in Parliament and as Chancellor of the Exchequer in 1950 because of broken health; was taken to Switzerland for a cure, but he did not recover.

Crispi, Francesco (1819–1901), noted Italian statesman, who aided Garibaldi and was his supporter throughout. Premier 1887–91 and 1893–96. Achieved many reforms for his country.

Crispin, St., a saint of the Roman Church and patron of shoemakers. In the 3rd century he and his brother, natives of Rome, settled in Soissons, France, and there preached Christianity, supporting themselves by shoemaking. Suffered martyrdom under Diocletian in 289, by being thrown into a cauldron of molten lead; commemorated on Oct. 25.

Croce, Benedetto (1866–1952), Italian philosopher and critic and one of the great figures of the 20th century. Devoted his long life to studying and writing, and his philosophy is expounded in the four volumes of *Filosofia dello Spirito* (which has been translated into English). He founded and edited *La Critica* in 1903, a review of literature, history, and philosophy. Strongly opposed to fascism, he was described during the war as "the grand old man who kept a torch burning in Naples which even Mussolini did not dare to extinguish."

Croesus (died c. 546 B.C.) the last King of Lydia (560–546 B.C.), who reigned fourteen years, and acquired such immense wealth that his name has ever since been proverbial. He was a wise king, whose memory still survives in his wise sayings. Solon was his friend, and it was Solon's name that he uttered thrice while standing before the pyre on which Cyrus had condemned him to be burnt. This touched Cyrus, who spared his life and made him his companion. He succeeded his father Alyattes on the Lydian throne, 560 B.C.

Crome, John (1769–1821), known as "Old Crome," from being a humble house-painter became eminent as a painter of landscape.

Cromer, 1st Earl of, P.C., G.C.B., O.M., G.C.M.G., K.C.S.I., C.I.E., F.R.S. (1841–1917), a diplomatist who won celebrity in the post of British Comptroller-General in Egypt from 1883 to 1907. It was a stupendous task that he had imposed upon him, but he resolutely devoted himself to it, with the result that Egypt was lifted from financial difficulty and internal disorder to a condition of prosperity. Pubs. *Modern Egypt* (1908) and *Abbas II* (1915).

Crompton, Samuel (1753–1827), was a poor cotton worker at Bolton who invented the spinning mule, which greatly increased the power of cotton production. Received little recognition.

Cromwell, Oliver (1599–1658), Lord Protector of the commonwealth of England, Scotland and Ireland, 1653–58. Born at Huntingdon, educated at Sidney Sussex College, Cambridge, and entered parliament as member for Huntingdon in 1628. With outbreak of civil war served with the parliamentary army under Essex and won renown at Edgehill (1642). Celebrated as a great general, leader of his Ironsides, for his religious toleration, and strong foreign policy. His victories include Marston Moor (1644), Naseby (1645), Dunbar (1650), Worcester (1651).

Cromwell, Richard (1626–1712), son of the foregoing, and his successor in the Protectorate.

Cromwell, Thomas (1485–1540), originally a protégé of Wolsey, rose to high office under Henry VIII, and began the suppression of the monasteries. Executed after the failure of the Anne of Cleves marriage, which was part of his policy of alliance with the Protestant princes of Germany.

Crookes, Sir William, O.M., F.R.S. (1832–1919) eminent British scientist whose researches in chemistry and physics led to many important discoveries and inventions. He discovered the metal thallium in 1861, invented the radiometer and the Crookes' tube, which was used by J. J. Thomson and others in their researches on conduction of electricity in gases. He was also an authority on sanitation. President of the Royal Society, 1913–16.

Cruikshank, George (1792–1878), a celebrated book illustrator who was for a time associated with Charles Dickens, and later on illustrated numerous works of other novelists of his day, showing great humour and power of character-delineation.

Cummings, Bruce Frederick (1889–1917), English zoologist and man of letters. Won fame with his *Journal of a Disappointed Man*.

Cunard, Sir Samuel, Bt. (1787–1865), shipowner and co-founder of the British and N. American Royal Mail Steam Packet Co. which later became the Cunard Line and as a result of a merger in 1934, the Cunard-White Star Line, owners of the great passenger ships, *Queen Mary* (1936–67), *Queen Elizabeth* (1940–68) and *Queen Elizabeth II* (launched 1967).

Cunningham of Hyndhope, Admiral of the Fleet, Viscount, K.T., G.C.B., O.M., D.S.O. (1883–1963), won the D.S.O. and two bars in the first world war, C.-in-C., Mediterranean, 1939–42 Allied Naval C.-in-C., North African campaign. First Sea Lord, 1943–46.

Cunningham, General Sir Alan Gordon, G.C.M.G., K.C.B., D.S.O., M.C. (b. 1887), brother of Viscount Cunningham. Directed Abyssinian campaign and commanded 8th Army, 1941. From 1945 served as the last British High Commissioner in Palestine.

Cunningham, Admiral of the Fleet, Sir John Henry Dacres, G.C.B., M.V.O. (1885–1962), C.-in-C., Mediterranean, 1943–46. First Sea Lord 1946–48.

Curie, Prof. Pierre (1859–1906) and **Madame Marie** (1867–1934) are names that have become famous as the discoverers of radium. M. Curie was a Frenchman, Mme. Curie a Pole; they were both indefatigable scientific investigators. Shared the Nobel Prize for Physics 1903, while their daughter, the late Mme. Irène Joliot-Curie, shared with her husband the 1935 Nobel Prize for Chemistry, awarded for their researches in radioactivity.

Curzon of Kedleston, Marquess, K.G., P.C., G.C.S.I., G.C.I.E. (1859–1925), statesman and administrator. As a young man gained distinction as traveller and author. From 1899 to 1905 was a vigorous and outstanding Viceroy of India. Foreign Secretary, 1919–23, when he played a dominant part in the reconstruction of the Middle East and was prominent at many conferences after the first world war.

Cuthbert, St. (635–687), a famous monk who became prior of Melrose, and afterwards of Lindisfarne. For a time he lived in seclusion on one of the Farne Islands, but from 684 was Bishop of Hexham.

Cuvier, Georges Léopold, Baron (1769–1832), a French naturalist who founded a system of classification in zoology, and originated the science of comparative anatomy.

Cuyp, Albert (1620–1691), a famous Dutch landscape painter, several of whose works are in our National Gallery.

Cyprian, St., was an eminent ecclesiastic of the 3rd century, who wrote several notable treatises on matters of Christian doctrine. He was beheaded in 258, at an advanced age, and the present English calendar commemorates him on Sept. 26.

Cyrus the Great (d. 529 B.C.), the founder of the Persian Empire who by his conquests of Media, Lydia, and Babylonia, made himself master of Asia Minor. He was a great warrior and a wise ruler and figures prominently in the Bible. He was slain in battle on the river Jaxartes.

D

Daguerre, Louis Jacques Mandé (1789–1851), a French artist, who acquired fame as the inventor of the earliest photographic process, and then devoted himself to scene-painting and became part-proprietor of the Diorama in Paris.

Daimler, Gottlieb (1834–1890), German inventor with N. A. Otto of Cologne of the Otto gas engine, and in his later years eminent as the inventor of the motor-car that is named after him.

Dale, Sir Henry Hallett, O.M., G.B.E., F.R.S., M.D., D.Sc., LL.D., F.R.C.P. (b. 1875). President, British Association, 1947, and of the Royal Society, 1940–45. Chairman of the Lister Institute of Preventive Medicine, 1942. Awarded Nobel Prize for Medicine, 1936.

Dalhousie, 1st Marquess of, P.C., K.T. (1812–1860). The tenth Earl and first Marquess of Dalhousie was one of the most famous of India's Governors-General. He controlled the affairs of India during a period of great difficulty, and annexed the Punjab after the second Sikh War; later on also annexing Nagpur Jhansi, Pegu and other States. He left India in 1856, the year before the Mutiny.

Dali, Salvador (b. 1904), Spanish painter whose *Persistence of Memory* with its bleak landscape and drooping watches is typical of surrealist art. In 1940 he went to live in America.

Dalton, John (1766–1844), famous chemist and mathematician, renowned for his work on the construction of matter. In 1810 published his classic *A New System of Chemical Philosophy*, in which the modern chemical atomic theory was first propounded. According to this theory the atoms of the chemical elements are qualitatively different from one another.

Damien, Father (Joseph de Veuster) (1840–1889), a Belgian missionary who, going out to Honolulu in 1864, and witnessing the terrible sufferings of the lepers confined on the Island of Molokai, obtained permission to take spiritual charge of the Government settlement, and remained there working nobly for this wretched community, until in 1889 he himself was stricken with leprosy and died.

Damocles, a Syracusan of the 5th cent. B.C., member of the court of Dionysius I. The legend related by Cicero concerning him is that he flattered his master by expressing his envy of the tyrant's riches and power, whereupon Dionysius, to demonstrate the precariousness of high estate, invited him to a banquet where he found himself sitting beneath a naked sword suspended by a hair. Hence the phrase "the sword of Damocles"—to hang by a thread.

Damrosch, Walter Johannes (1862–1950). American musician, active in the musical development of the United States. Conductor of the New York Symphony Society, 1885–1927, and composer of three operas and of incidental music to Greek plays.

D'Annunzio, Gabriele (1863–1938), Italian poet, soldier and airman. In Sept. 1919 he led an unofficial raid on Fiume and seized the port and town; when the Treaty of Rapallo was signed in 1920, he refused to recognise it, and declared war against Italy but was forced to surrender. His bodyguard wore the blackshirt which was to become the uniform of the Fascists.

Dante Alighieri (1265–1321), the greatest Italian poet and one of the great figures of world literature, was born in Florence in a period of political upheaval caused by the strife between Guelph and Ghibelline, which had divided mediaeval Italy for over a century. Though he saw her but once or twice, he conceived an abiding love for a Florentine lady, Bice Portinari (called by Dante Beatrice), wife of Simone di Bardi, whom he first met in 1274. She died in 1290. Some of his finest work was written after he was driven from his native city in 1301. His works include the *Vita Nuova* (written 1292–93 in memory of Beatrice), his supreme masterpiece the *Divine Comedy*, begun 1308–9 and completed shortly before his death, many beautiful lyrics, and some Latin treatises.

Danton, Georges Jacques (1759–1794), a famous member of the National Convention at the period of the first French Revolution. Was made President of the Committee of Public Safety, but Robespierre attacked and supplanted him. Danton was consigned to the guillotine shortly afterwards.

D'Arblay, Madame (1752–1840), better known as Frances (Fanny) Burney, daughter of the organist Dr. Charles Burney, made a great sensation while quite young and unmarried by her novel *Evelina*, which opened the doors of Society to her and gained her the friendship of Dr. Johnson.

Darius was the name borne by three Persian kings. The first reigned from 521 to 485 B.C., and was defeated by the Greeks at Marathon. The second was a natural son of Artaxerxes Longimanus, and having obtained the crown by the murder of his brother, reigned from 424 to 405 B.C. The third Darius was the last of the Persian kings, reigning only from 336 to 331 B.C. when Alexander the Great invaded his kingdom and defeated him in two great battles. Soon after he was assassinated.

Darling, Grace Horsley (1815–1842), English heroine who by putting off in a small boat from the lighthouse on one of the Farne Islands, of which her father was keeper, saved the shipwrecked crew of the *Forfarshire*.

Darnley, Earl of (1545–1567), was married to Mary Queen of Scots—as her second husband—in 1565. Two years later, after Mary had entered into an intrigue with Bothwell, he was murdered.

Darwin, Charles Robert, F.R.S. (1809–1882), the distinguished scientist, whose *Origin of Species* first clearly formulated and elaborated the theory of evolution. His first work (1837) described a five years' cruise in the *Beagle*, which the Government had sent out for scientific purposes. His *Origin of Species* appeared in 1859, and, though defended and supported by the scientific thought of the time generally, was much attacked by theologians. In 1871 Darwin issued his *Descent of Man*, a still further elaboration of the evolution theory. His other principal works were *The Expression Of Emotion in Man and Animals* (1872), *Insectivorous Plants* (1875), *Different Forms of Flowers* (1877), and *Worms* (1881).

Daudet, Alphonse (1840–1897), the celebrated French humorist and novelist, all of whose works have been translated into English.

Davenant, Sir William (1606–1668), a dramatist and poet of much note in his time, who filled the office of Poet Laureate in succession to Ben Jonson.

David I. (1084–1153) was King of Scotland and uncle of Matilda, daughter of Henry I.: he took up arms against Stephen on his repudiation of Matilda's claims to the English crown.

David II. (1324–1371), King of Scotland from 1330 to 1370. He was the son of Robert Bruce, and

in conflict with the English Army at Neville's Cross, in 1346, was defeated and made prisoner by Queen Philippa.

David, Sir (Tannatt William) Edgeworth, K.B.E., C.M.G., D.S.O., F.R.S. (1858–1934), an Australian geologist of the first rank, who was Professor of Geology at Sydney University 1891–1924. Spent much of his time in exploration, and accompanied as geologist Shackleton's Antarctic Expedition, 1907–9, leading the party that ascended Mt. Erebus, and discovering with Sir Douglas Mawson the South Magnetic Pole.

David, Jacques-Louis (1748–1825), a celebrated French painter of classic subjects, who put his art at the service of the New Republic.

David, St., patron saint of Wales, whose festival falls on March 1st, lived in the 6th century in Wales, and founded various monasteries.

Davidson, Randall Thomas Davidson, 1st and only Baron, P.C., G.C.V.O. (1848–1930), Archbishop of Canterbury, 1903–1928. Dean of Windsor, 1883–1891; Bishop of Rochester, 1891–1895; and Bishop of Winchester, 1895–1903. Was for a long period Domestic Chaplain and Clerk of the Closet to Queen Victoria, and married in 1878 the daughter of Archbishop Tait.

Davies, Rt. Hon. Clement, Q.C., M.P. (1884–1962), lawyer and politician. Called to the Bar, 1909, took silk, 1926. He led the Liberal Party from 1945 until 1956, and represented his native Montgomery from 1929 until his death.

Davies, Sir (Henry) Walford, K.C.V.O., O.B.E., Mus.D., D.Mus. (1869–1941), Master of the King's Music, 1934–41; Director of Music and Chairman of the National Council of Music, University of Wales, 1919–41, the Gresham Prof. of Music, 1924–41.

Davies, William Henry (1871–1940), was a Welsh poet who spent his early life as a tramp and odd-job man. For six years he wandered about America, where he lost a foot "train-jumping," and for eight years followed a similar life in England, tramping, peddling and stopping in common lodging-houses. His poems reveal an intimate knowledge of and love for Nature. An account of his life is given in his *Autobiography of a Super Tramp*.

Da Vinci. *See* **Leonardo.**

Davis, Jefferson (1808–1889), an American statesman, who on the breaking out of Civil War, was made President of the Confederate States After the war he was a prisoner in the hands of the Federals, put on his trial for treason, and subjected to much indignity, but was ultimately discharged and wrote (1881) *The Rise and Fall of the Confederate Government*.

Davis, John (*c.* 1550–1605), one of the great Elizabethan explorers and discoverer of Davis's Strait, the channel between the Atlantic and Arctic Oceans on the west of Greenland. Invented the backstaff, or Davis's quadrant.

Davitt, Michael (1846–1906), after a hard-working and precarious bringing up this ardent Irish Nationalist attracted much notice by the bitter speeches he made on behalf of the Fenian Brotherhood, and in 1870 was sentenced to fifteen years' penal servitude for treason-felony, but was released on ticket of leave in 1877. Was one of the founders of the Irish Land League 1879. In 1881 was sent back to penal servitude, but released again in the following year. Was elected to Parliament while a prisoner at Portland but disqualified. Succeeded in entering Parliament in 1892, and resigned in 1899.

Davy, Sir Humphry, Bt., F.R.S. (1778–1829), the inventor of the safety-lamp. Was an eminent chemist whose researches and discoveries were of great scientific importance. Was the first to employ the electric current in chemical decomposition and discovered that nitrous oxide was perfectly respirable.

Dawber, Sir (Edward) Guy, R.A. (1861–1938), English architect. As Chairman of the Council for the Preservation of Rural England, he did much to bring about the restoration of buildings throughout the country.

Dawkins, Sir William Boyd (1837–1929), British geologist, noted for his research on fossil mammals. Made Channel Tunnel survey in 1882.

Dawson, (George) Geoffrey (1874–1944), editor of *The Times*, 1912–19, and 1923–41.

Deakin, Rt. Hon. Arthur, C.H., C.B.E., J.P. (1890–1955), Trade Union leader; succeeded Ernest Bevin as general secretary of the Transport and General Workers' Union in 1949 and like him was a master negotiator.

Debussy, Claude Achille (1862–1918), French composer and founder of the Impressionist school in music, whose harmonies have a vague "atmospheric" effect. Among his works are *Suite bergamasque*, containing the popular *Clair de lune*, *L'après-midi d'un Faune*, inspired by the poem of Mallarmé, and *La Mer*. He also wrote an opera *Pelléas et Mélisande* based on Maeterlinck's drama and many piano compositions and songs. *See* **Section E.**

Defoe, Daniel (1660–1731), the son of a London butcher. He became a political writer and novelist, obtaining world-wide fame by his *Robinson Crusoe*, written when he was nearly sixty years of age.

De Forest, Lee (1873–1961), American inventor who was the first to use alternating-current transmission, improved the thermionic valve detector and amplifier, which revolutionised wireless and by which modern wireless and sound films (Talkies) were made possible. He designed the first high-power station for the United States Navy and was granted over three hundred patents.

Degas, (Hilaire Germain) Edgar (1834–1917), French painter and sculptor, son of a banker, an important figure in the impressionist movement and a great experimenter. The subjects which interested him were those of everyday life—dancers, café life, the racecourse.

De Gasperi, Alcide (1881–1954), Italian catholic politician. Founded the Christian Democrat Party and worked for European federation. Died on eve of breakdown of Brussels Conference on E.D.C. Prime Min. 1945–53.

De Gaulle, General. (*See* **Gaulle, Charles de.**)

De Havilland, Sir Geoffrey, O.M., C.B.E., F.R.Ae.A. (1882–1965), a pioneer of civil and military aviation. Began flying in 1908 and was the founder of the Stag Lane Aerodrome at Hendon and the designer of the famous Moth machines. Contributed in great measure to the advance of civil aviation since the first world war. Awarded the Guggenheim Medal in 1952. His son was killed in 1946 while testing a plane in preparation for breaking world speed record.

Delacroix, Ferdinand Victor Eugène (1798–1863), French painter of great imaginative and dramatic force, of the romantic school.

De la Mare, Walter John, O.M., C.H. (1873–1956), English poet and novelist whose work has a characteristic charm. Much of it was written for children.

Delane, John Thadeus (1817–1879), the famous editor of *The Times*, who, though he did not write himself, made his paper the greatest journal in the world. He occupied the editorial chair from 1841 to 1877.

Delaroche, Paul (Hippolyte) (1797–1856), an eminent French historical painter.

Delibes, Clément Philibert Léo (1836–91), French composer of much graceful music, including several operas, of which *Lakmé* is the most famous, and ballets, among them *Coppélia*.

Delius, Frederick, C. H. (1862–1934), English composer of German parentage. Highly idiosyncratic in idiom, his music was more readily received in Germany than England until Sir Thomas Beecham's inspired performances won popularity for him in his native land. *See* **Section E.**

Democritus (*c.* 470–*c.* 400 B.C.), one of the first scientific thinkers, pupil of Leucippus (fl. *c.* 475 B.C.), also probably of Miletus. He took an atomic view of matter, denied the existence of mind as a separate entity, and counted happiness and inner tranquillity as important moral principles. His attitude was not shared by his contemporary Socrates, nor by Plato and Aristotle. The atomic theory thus passed into the background for many centuries. His followers were known as Epicureans, after the most distinguished of them, Epicurus of Samos (342–270 B.C.).

Demosthenes (385–322 B.C.), the famous Greek orator, statesman and warrior who, by his *Philippics*, roused the Athenians to resist the growing power of Philip of Macedon. Sixty-

one of his orations were preserved, and are regarded as the finest examples of their kind.

De Quincey, Thomas (1785–1859), an eminent essayist and critic, the friend of Coleridge, Wordsworth, and Southey. His *Confessions of an Opium-eater* is a British classic.

De Reszke, Jean (1853–1925) and **De Reszke, Edouard** (1856–1917), Polish operatic singers, the first a tenor, the second a baritone, who achieved fame and fortune by their singing.

Derwentwater, 3rd Earl of (1689–1716), the leader of the English Jacobite movement for placing the Pretender on the English throne. The rising took place in 1715, but was completely crushed by the Battle of Preston, and Derwentwater was beheaded.

Descartes, René (1596–1650), the famous French philosopher, mathematician, and author. Unconvinced by scholastic tradition and theological dogma, he sought to get back to primary truth, to the very definition of knowledge or the reason why anything can be said to be true. The basis of his Cartesian philosophy is summed up in his own words *cogito, ergo sum* (I am thinking so I exist).

Desmoulins, Lucie Simplice Camille Benoist (1760–1794), was one of the fiercest of the French Revolutionary leaders, and from the destruction of the Bastille to the early days of the Terror was unflagging in his onslaughts upon the aristocrats and the priesthood. He fell under the displeasure of Robespierre, however, and was sent to the guillotine along with Danton.

De Valera, Eamon, LL.D. (b. New York, 1882), Pres. Rep. of Ireland, 1959– ; leader of the Fianna Fail Party; Prime Minister 1938–48, 1951–54, and 1957–59; Minister for External Affairs 1932–48. Pres. of Executive Council of Irish Free State, 1932–38; Pres. of Sinn Fein 1917–26 when Fianna Fail was founded; Delegate to Assembly and Council of League of Nations, 1932, and President thereof 1932 and 1938.

De Valois, Dame, Ninette, D.B.E. (b. 1898), Irish-born ballet dancer and choreographer. Between world wars had many triumphs as a dancer with the British National Opera company and with the Diaghilev Russian ballet. Director of the Royal Ballet School (formerly the Sadler's Wells School).

Dewar, Sir James, F.R.S. (1842–1923), physicist and chemist, a native of Kincardine. From 1875 until his death Jacksonian Prof. of Natural Philosophy at Cambridge and from 1877 Fullerian Prof. of Chemistry at the Royal Institution. Famous for his work on the liquefaction of gases and his invention of the Thermos flask. Invented, with Sir F. Abel, the explosive cordite.

Dewey, Prof. John (1859–1952), the eminent American philosopher, psychologist and educationist, who, after holding professorships at the Universities of Minnesota, Michigan, and Chicago, where he was also Director of the School of Education until 1904, was Prof. of Philosophy at Columbia University, New York, 1904–32. A follower of William James, he became well known in America as an adherent of pragmatism.

De Witt, Jan (1625–72), Dutch republican statesman, who carried on war with England and later negotiated the Triple Alliance, but was overthrown by the Orange Party and murdered.

Diaghilev, Sergei Pavlovich (1872–1929), Russian ballet impresario and founder of the Russian ballet, who selected the best dancers, musicians, and artists in his productions. Among those associated with him were Anna Pavlova, Vaslav Nijinsky, Tamara Karsavina, Leonide Massine, Michel Fokine, the choreographer, L. N. Bakst, the painter, and Igor Stravinsky, the composer.

Dick, Sir William Reid, K.C.V.O., R.A., F.R.B.S. (1879–1961), British sculptor whose works include the Livingstone statue (Victoria Falls, Africa), memorial statue of King George V. at Westminster, and the statue of Pres. Roosevelt in Grosvenor Square.

Dickens, Charles (John Huffam) (1812–1870), the most popular novelist of the 19th century, who from very humble beginnings worked himself up to the highest position in the world of letters. His literary output was enormous. From the time of the publication of the *Pickwick Papers* down to his death in 1870, covering a period of 33 years, he produced novel after novel, all possessing the original Dickensian characteristics, yet each wonderfully different from the rest and his popularity continues undiminished. He did so much for the cultivation of the true sentiment of Christmas that, whenever that season comes round, his name is recalled with honour and homage. As a public reader of his own works Dickens evinced a marvellous dramatic gift. He was buried in Westminster Abbey.

Dickinson, Goldsworthy Lowes (1863–1932), English scholar, author and philosopher; an interpreter and upholder of the Greek view of life, which is the subject of many of his books.

Dicksee, Sir Francis Bernard, R.A. (1853–1928), well known as the painter of numerous pictures, including "Harmony," "Romeo and Juliet," and "The Funeral of a Viking."

Diderot, Denis (1713–1784), the famous French philosopher and editor of the *Dictionnaire Encyclopédique*, which occupied him thirty years.

Diefenbaker, Rt. Hon. John George, M.A., Q.C. (b. 1895), Canadian lawyer and leader of the Canadian Progressive Conservative Party; Prime Min., 1957–63.

Diemen, Anthony van (1593–1645), Dutch Admiral who was Governor-General of the East Indian Colonies, 1636–45. He extended Dutch influence and trade throughout the Far East, promoted explorations to Australia, 1636–42, and on one of such explorations, Abel Tasman discovered New Zealand and named the island which we now know as Tasmania, Van Diemen's Land.

Diesel, Rudolf (1858–1913), German engineer, inventor of an internal-combustion engine which he patented in 1893. The modern so-called Diesel engine represents the improvements achieved by many men and has evolved mainly from the invention of Herbert Akroyd-Stuart, patented in 1890.

Diocletian (Caius Aurelius Valerius Diocletianus) (245–313), Roman Emperor (284–305). Inaugurated the system of partnership emperors, whereby the Empire was divided into four sections (the famous tetrachy), administered by himself in the East, Maximian in Italy and Africa, Constantius in Britain, Gaul, etc., and Gallerius in Illyricum. Ruthlessly persecuted the Christians.

Diogenes (412–322 B.C.), the celebrated Greek cynic philosopher who is said to have lived in a tub wearing the coarsest clothing and living on the plainest food. Many of his sayings have been preserved.

Dionysius. Two of the tyrants of Syracuse bore this name. The first was a great soldier and statesman as well as a poet and philosopher, and lived from c. 430–367 B.C. The second Dionysius was his son and successor, but was of such a cruel disposition that he was driven from the throne and died in obscurity in 343.

Disney, Walter Elias ("Walt") (1901–66), American film cartoonist; creator of Mickey Mouse. His *Silly Symphonies*, *Snow White and the Seven Dwarfs*, *Pinocchio*, and *Fantasia* brought him world-wide fame.

Disraeli, Benjamin. (*See* Beaconsfield).

D'Israeli, Isaac (1766–1848), father of Benjamin Disraeli, worked in a special literary field, and produced some interesting volumes dealing with authors and their writings. His best-known work is *Curiosities of Literature*.

Dixon, Harold Bailey (1852–1930), Professor of Chemistry at Manchester University, 1887–1922, whose work on gaseous explosions opened a new era in combustion research.

Dobson, Frank, C.B.E., A.R.A., A.R.B.S. (1888–1963), English sculptor. President of the London Group, 1923–27.

Dobson, Henry Austin, LL.D. (1840–1921), a Civil Servant from 1860 to 1901, he was the author of several volumes of Society verse and prose works, dealing chiefly with the 18th century.

Dodd, Francis, R.A., R.W.S. (1874–1949), painter, engraver and draughtsman. He was one of the official artists during the War of 1914–18, and executed a valuable series of portraits of British Admirals and Generals on active service. Appointed one of the official artists for the second world war, 1939–45.

Dodgson, Charles Lutwidge (1832–1898), a writer and mathematical lecturer at Christ Church, Oxford, who, under the pseudonym of Lewis Carroll, achieved lasting fame by his *Alice's*

Adventures in Wonderland, one of the most delightful books for children ever written.

Dolci, Carlo (1616–1686), the famous Florentine painter, examples of whose Madonnas and Saints are to be found in most National collections.

Dolci, Danilo (b. 1925), Italian architect who since 1952 has dedicated himself to the rehabilitation of the people of Sicily in their desperate poverty. He began with no resources but his own humanity, but now his work—agricultural, educational, and social—is inspiring world-wide interest.

Dominic, St. (1170–1221), founder of the Order of Dominicans, or Black Friars, who devoted much energy to the conversion of the Albigenses, but meeting with small success, instituted a policy of persecution after the manner of the later Inquisition.

Domitian (Titus Flavius Domitianus) (A.D. 51–96), Roman Emperor, son of Vespasian, who after many cruel and tyrannical acts aroused the enmity of the people and was assassinated.

Donatello (Donato di Niccolò di Betto Bardi) (1386–1466) the famous Italian sculptor, whose works are to be seen chiefly at Florence, though several examples are at South Kensington.

Donizetti, Gaetano (1797–1848), Italian operatic composer. Most popular of his sixty operas are *Lucrezia Borgia*, *Lucia di Lammermoor*, *La Fille du régiment*, *La Favorita*, and *Don Pasquale*.

Donne, John (1573–1631), an English poet and divine. As a preacher he was celebrated in his lifetime but few of his poems were printed and it was not until the 20th century that he was universally recognised as one of the most original of English poets. His writings include *Songs and Sonnets*, *Satyres*, *Elegies*, *Problems and Paradoxes*, and the *Holy Sonnets*. He took orders in 1615 and was made dean of St. Paul's in 1621. Sir Edmund Gosse's *Life and Letters* appeared in 1899 and Sir Herbert Grierson's monumental edition of Donne's poetry in 1912.

Donoghue, Stephen ("Steve") (1884–1945), in his day a famous jockey. Rode the Derby Race winner six times, and established a new record by winning this classic event in three successive years, 1921–22–23.

Doré, Gustave (1833–1883), the well-known French artist, famous for his colossal scriptural paintings and his powerful illustrations to the works of Dante, Milton, and Tennyson.

Dostoyevsky Feodor Mikhailovitch (1821–1881), one of Russia's greatest novelists. Author of *Crime and Punishment*, *Brothers Karamazov*, *The Idiot*, *The Possessed*, etc. Dostoyevsky's novels are quite exceptional for their deep psychological insight, vision and marvellous tragic and analytic power, and have had a profound influence on modern European writers.

Douglas, Marshal of the R.A.F. Lord, G.C.B., M.C., D.F.C. (b. 1893), commanded Fighter Command, 1940–42, R.A.F. Middle East, 1943–44, and Coastal Command, 1944–45. C.-in-C. and Military Governor of British Zone of Germany, 1946–47. A Labour peer.

Douglas, Norman (1868–1952), novelist and writer of witty and elegant prose. A Scot, born in Austria, he made his home on the Mediterranean and was buried on Capri. Travel books include *Siren Land* (1910), *Fountains in the Sand* (1912), *Old Calabria* (1915), *Alone* (1921), *Together* (1923); his highly entertaining novel *South Wind* was published in 1917.

Douglas-Home, Rt. Hon. Sir Alexander Frederick, M.P. (b. 1903), British statesman; Prime Minister, 1963–64; Leader of the Conservative Party, 1963–5; M.P. for Kinross and W. Perthshire, 1963–; Foreign Sec., 1960–63; Sec. of State for Commonwealth Relations, 1955–60. Formerly the 14th Earl of Home; renounced title in 1963 to stand as candidate for House of Commons. Chancellor, Heriot-Watt Univ.

Doulton, Sir Henry (1820–1897), famous potter and the inventor of Doulton ware.

Dowden, Edward, M.A., LL.D., D.C.L., Litt.D. (1843–1913). Well known for his critical and other writings, mainly dealing with the lives and works of the poets. Was Professor of Literature at Trinity College, Dublin, for 37 years

Dowding, Air Chief Marshal Lord, G.C.B., G.C.V.O., C.M.G. (b. 1882), Chief of Fighter Command in Battle of Britain, 1940.

Dowland, John (*c.* 1563–1626), English composer whose songs with lute accompaniment established him as the foremost lutanist of his day. His son Robert succeeded him as Court lutanist to Charles I.

Doyle, Sir Arthur Conan, M.D. (1859–1930), masterly writer of detective stories, the creator of Sherlock Holmes, the archetype of detectives, who shared a flat in Baker Street with his friend and chronicler, Dr Watson, and conducted a long series of investigations. The immensely popular stories appeared in the *Strand Magazine* and include the *Hound of the Baskervilles* and the *Speckled Band*.

Doyle, Richard (1824–1883), an artist of much humour and fancy, who was exceedingly popular while on the staff of *Punch* from 1841 to 1850. The familiar cover of *Punch* is his work.

D'Oyly Carte, Richard (1844–1901), English theatrical manager, associated with the production of the Gilbert and Sullivan comic operas. The D'Oyly Carte Opera Companies played Gilbert and Sullivan all over the world.

Drake, Sir Francis (*c.* 1540–1596), the great admiral of Queen Elizabeth's time, who made many adventurous voyages, bent partly on discovery and partly on plunder. He was a leading figure—under Lord Howard—in the attack on and destruction of the Spanish Armada in 1588.

Draper, John William (1811–82), American chemist, b. near Liverpool, aided in the organisation of the medical school of New York university and became its professor of chemistry and physiology. He was the first to take a satisfactory photograph of the human face (1840).

Dreiser, Theodore (1871–1945), an American author whose novels of American life are written in vigorous native prose.

Dreyfus, Lt.-Col. Alfred (1859–1935), a French officer, condemned by a military secret tribunal on a charge of divulging secrets in 1894 to a foreign power, and condemned to imprisonment for life on Devil's Island in French Guiana. At a sensational new trial in 1899 he was again found guilty, and sentenced to a mitigated term of incarceration for ten years; but strenuous efforts on his behalf secured a pardon later. In 1906 he was entirely exonerated and reinstated in the army, with the rank of Major, and made a Chevalier of the Legion of Honour.

Drinkwater, John (1882–1937), was a well-known dramatist and poet. His plays *Abraham Lincoln* and *Oliver Cromwell* have had great praise and success.

Driver, Samuel Rolles (1846–1914) a distinguished Hebrew and Old Testament scholar who was Regius Prof. of Hebrew at Oxford, 1883–1914.

Drummond, William (1585–1649), a Scottish poet —laird of Hawthornden—whose works dealt largely with political matters, but revealed considerable poetic power. Ben Jonson walked from London to Scotland to pay him his respects.

Drury, (Edward) Alfred (Briscoe), R.A. (1857–1944). English sculptor who was responsible for may public monuments, including the colossal statues of Queen Victoria at Bradford and Portsmouth (1903), the decorations for the exterior of the War Office (1905) and of the Victoria and Albert Museum (1909).

Dryden, John (1631–1700), one of the most vigorous and prolific of English poets and writers, and a popular dramatist. He excelled in satire, and drew some powerful pictures of the statesmen of his day. His translation of Virgil ranks with Pope's translation of the *Iliad*. He was buried in Westminster Abbey. Originally a Parliamentarian he went over to the Royalists and was laureate and historiographer-royal, 1670–88.

Du Barry, Marie Jeanne Bécu, Comtesse (1746–1793), succeeded Mme de Pompadour as mistress of Louis XV of France. Guillotined by the Revolutionary Tribunal.

Du Chaillu, Paul Belloni (1835–1903), a noted African traveller who was chief of General Gordon's staff in 1874, and wrote many valuable books of travels, his studies of the gorilla being especially interesting.

Dufferin and Ava, 1st Marquess of, P.C., K.P., G.C.B., G.C.S.I., G.C.M.G., G.C.I.E., F.R.S. (1826–1902), was a diplomatist of great experience, a writer of brilliance, and filled many high offices with distinction and success, including those of Governor-General of Canada and Viceroy of India.

Dulles, John Foster, (1888–1959), U.S. Secretary of State in the Republican Administration, 1953–59. In his foreign policy he encountered widespread criticism for his inflexible opposition to negotiation with Russia and U.S. recognition of China.

Dumas, Alexandre (1802–1870), French novelist and dramatist, who published more volumes than any man of his time. In the field of historical romance he showed wonderful power and resource and his thrilling story *Monte Cristo* is one of the great novels of the nineteenth century. He also wrote *The Three Musketeers*.

Dumas, Alexandre, Fils (1824–1895), French dramatist and novelist, son of the last-named, author of *La Dame aux Camélias*.

Du Maurier, George Louis Palmella Busson (1834–1896), one of the best known of the *Punch* artists during a long period and author of the novels of *Peter Ibbetson*, *Trilby*, and *The Martian*.

Dundee, John Graham of Claverhouse, 1st Viscount (1648–89), known as "Bonnie Dundee," royalist leader employed in the suppression of the Covenanters, taking part in the defeat at Drumclog and the victory of Bothwell Brig under the Duke of Monmouth in 1679. Defeated Mackay in the pass of Killiecrankie but was killed in the moment of victory.

Duns Scotus, John (*c.* 1265–*c.* 1308), famous scholastic, born at Maxton, in the county of Roxburgh; joined the Franciscan Order at Dumfries in 1281; ordained priest at Lincoln in 1291; student and teacher at Oxford and Paris; died at Cologne. He was the great doctrinal opponent of Thomas Aquinas and has been named the Subtle Doctor.

Dunstable, John (*c.* 1380–1453), the earliest great English composer known by name. He was a contemporary of the Netherlands composers Dufay and Binchois. *See* Section E.

Dunstan, Saint (909–988), the famous Abbot of Glastonbury and Archbishop of Canterbury, who lived through seven reigns from Ethelstan to Ethelred and exercised great political influence.

Dupleix, Joseph François (1697–1763), was governor of the French East Indian possessions at the time when Clive was guiding the fortunes of the East India Company, and after Clive's victory at Plassey Dupleix's day was over. He returned to France, and fell into disgrace and poverty.

Dürer, Albrecht (1471–1528), the great German painter and engraver of Nuremberg, friend of Luther and Melancthon. Like his great Italian contemporary, Leonardo, he was not only a superb artist but a man of boundless intellectual curiosity and scientific insight, a true son of the Renaissance. His copper engravings include his three great masterpieces, *The Knight*, *Melancholia*, and *St. Jerome in His Study*. Many of his engravings are in the British Museum. He may be regarded as the founder of the German school and the inventor of etching.

Durham, John George Lambton, Earl of (1792–1840), served as Governor-General of Canada after the disturbances of 1837, and in 1839 presented the famous *Durham Report* to Parliament. This laid down the principle of colonial self-government and marks a turning-point in the affairs of the Empire.

Duse, Eleonora (1861–1924), an Italian tragedienne of world-wide reputation.

Duval, Claude (1643–1670), a notorious highwayman who, coming to England from Normandy in the Duchess of Richmond's service, took to "the road," and for a few years successfully evaded capture. He was hanged at Tyburn.

Duveen, 1st and only Baron, of Millbank (1869–1939), was head of a firm of noted art dealers, and a generous benefactor to British Art.

Dvořák, Antonín (1844–1904), Czech composer whose music is rich in the folk-song melodies of his native Bohemia and has a characteristic lilt and harmony. In 1884 he conducted his *Stabat Mater* in London, where this cantata and his *Slavonic Dances* were very popular. Composed his *From the New World* symphony in New York where he was head of the National Conservatoire (1892–94). He wrote 9 symphonies besides much orchestral and chamber work. *See* Section E.

Dyson, Sir Frank (Watson), K.B.E., F.R.S. (1868–1939), Astronomer Royal (1910–33). Was previously (1905–10) Astronomer Royal for Scotland. Was the author of a number of works on astronomy, and widely celebrated for his interesting public lectures.

Dyson, Sir George, K.C.V.O., M.A., Mus.D., LL.D., F.R.C.M. (1883–1964), Director of the Royal College of Music 1938–53. Author of *The New Music*, in which he analyses the technique of modern schools of composition. Composed a symphony, a violin concerto, and several choral works such as *The Canterbury Pilgrims* and *Nebuchadnezzar*.

E

Eastlake, Sir Charles Lock (1793–1865), English painter of historical and religious works. Pres. of R.A. 1850.

Eastman, George (1854–1932), American inventor who invented the roll photographic film and the famous Kodak camera. He amassed a vast fortune and his philanthropies were estimated at over £60 million. After a long illness he committed suicide.

Eck, Johann von (1486–1543), one of the most vigorous opponents of the Reformation in Germany.

Eddington, Sir Arthur Stanley, O.M., F.R.S. (1882–1944), Plumian Professor of Astronomy, Cambridge, 1913; Director of the Cambridge Observatory, 1914–44. Author of *The Nature of the Physical World* (1928) and many scientific works.

Eddy, Mrs. Mary Baker (1821–1910), founder of the religion (theology and practice) which she named Christian Science, and of the Church of Christ, Scientist. Author of the Christian Science text-book, *Science and Health with Key to the Scriptures*, published in 1875. *See also* J9.

Edelinck, Gerard (1640–1707), French engraver, b. in Antwerp, the first to reproduce in print the colour, as well as the form, of a picture. Patronised by Louis XIV.

Eden, (Robert) Anthony, 1st Earl of Avon, K.G., M.C., (b. 1897), succeeded Sir Winston Churchill as Prime Minister in April 1955. He had been Deputy Prime Minister and Foreign Secretary since 1951. First appointed Foreign Secretary in 1935 (the youngest to hold that office for over a century), but resigned in 1938 on a difference of policy with Mr. Neville Chamberlain about relations with Italy. Entered Parliament as a member for Leamington in 1923. He has many diplomatic achievements to his credit, though his Suez policy in 1956 divided the country. Resigned because of ill-health in Jan. 1957. Memoirs, *Facing the Dictators; The Reckoning;* and *Full Circle*. Earldom conferred 1961.

Edgar (943–75), King of England 959–75, who under the influence of Dunstan was able to carry out many useful reforms.

Edgar Atheling (*c.* 1060–*c.* 1130), as grandson of Edmund Ironside, was the lawful heir of Edward the Confessor, but in the confusion of the Norman invasion he was unable to maintain his claim.

Edgeworth, Maria (1767–1849), Irish novelist, whose stories included *Castle Rackrent*, *The Absentee*, and *Belinda*.

Edinburgh, H.R.H. Prince Philip, Duke of, K.G., P.C., K.T., G.B.E. (b. 1921), consort of H.M. Queen Elizabeth II. Relinquished his title of Prince Philip of Greece and of Denmark on his naturalisation in 1947, taking the name of Mountbatten. He is the great-great-grandson of Queen Victoria, grandson of Admiral Prince Louis of Battenberg, and nephew of Earl Mountbatten of Burma. Educated in England and Germany and at the Royal Naval College. Served in the Royal Navy throughout the war. Pres. of the National Playing Fields Association; Pres. of the British Association, 1951–52. Chanc. Univs. Wales, Edinburgh and Salford.

Edison, Thomas Alva (1847–1931), an American inventor, who after an adventurous boyhood became a telegraph operator and interested in electrical problems. Established himself in New York in 1869, and invented an improved printing telegraph. In 1887 set up an elaborate laboratory and factory at Menlo Park, New Jersey, from which place he sent out many clever and some startling inventions, including a system of duplex telegraphy, afterwards im-

proved into quadruplex and sextuplex transmission, the phonograph, and a method of preparing carbon filaments for the electric lamp; patented over 1300 inventions.

Edmund II. (Ironside) (980–1016), the son of Ethelred, after years of contention with the Danes, made a compact with Canute to divide England between them, but dying shortly afterwards the kingdom was settled on Canute.

Edward the Confessor (*c.* 1004–1066), the Anglo-Saxon king who immediately preceded—save for the brief reign of Harold of less than a year—the Norman Conquest, and founded Westminster Abbey, where a smaller church, then dilapidated, had previously for a period had a precarious existence. He was a religious-minded mystic, and was canonised in 1161, and given the shrine in the Abbey of his origination, which yet remains fairly intact, despite the ravages of time and disturbing hands.

Edward the Elder was the son of Alfred, and succeeded him as King of the West Saxons in 899. He was successful in overcoming the Danes, and became overlord of the Northern counties.

Edward the Martyr (963–979) became king in succession to Edgar, but, although supported by Dunstan, was not able to prevail against his stepmother Elfrida, who had him murdered.

Edward I. (1239–1307) was king of England from 1272 to 1307. Took part in the Crusades, completed the conquest of Wales, overcame Scottish opposition—executing Wallace and receiving the submission of Bruce, and promulgated many wise laws. He was nicknamed " Longshanks."

Edward II. (1284–1327), the son of Edward I. succeeded his father when the latter died at Burgh-over-Sands in 1307. Suffered defeat at the hands of the Scots at Bannockburn, and on account of his arbitrary disposition, cruelty and lavish concessions to favourites, was deposed in 1327, and afterwards murdered at Berkeley Castle.

Edward III. (1312–1377) was one of the ablest of English monarchs who, although much taken up with long and bitter wars with France and Scotland, did much for the commercial interests of the nation, and was the means of introducing large numbers of Flemings into the country, who laid the foundation of the English textile manufacturers. He married Philippa of Hainault, and was the father of Edward the Black Prince.

Edward IV. (1442–1483) Yorkist leader whose reign brought about a revival in the power of the monarchy, in English sea power, and in foreign trade. Spent 1470–71 in exile. He died of dissolute living after having made a fortune in trade. Patron of Caxton. Began rebuilding of St. George's Chapel, Windsor.

Edward V. (1470–1483)—elder son of Edward IV. and Elizabeth Woodville. Succeeding his father at the age of 12, he was a pawn in the quarrels of his maternal relatives and his paternal uncle, Richard, Duke of Gloucester. He and his younger brother, Richard, Duke of York, were shut up in the Tower by Richard, declared bastards, and there probably murdered, though conclusive proof of their exact fate has never been established. Thus Richard, who had had himself made Protector, became the legitimate heir to the Crown.

Edward VI. (1537–1553), succeeded his father, Henry VIII., when in his tenth year and died in his sixteenth year. The Reformation under the Regency of Somerset first, and then of Northumberland, made considerable progress during his brief reign. He was induced during his last illness to name Lady Jane Grey his successor, with results disastrous to that unfortunate personage and many others concerned.

Edward VII. (1841–1910). Was married to Princess Alexandra of Denmark in 1863. Visited India in 1875, and from that time onward was constantly in the public eye, taking part in all kinds of functions. Succeeded to the throne on the death of Queen Victoria, Jan. 22, 1901. The Coronation, which had been planned for June 26, 1902, had to be postponed in consequence of the King's sudden illness, but eventually took place on August 9 in the same year. His Majesty was a powerful factor in the preservation of the peace of Europe, his friendly intercourse with the heads of the French, German, and other nations earning for him the title of " Edward the Peacemaker."

Edward VIII. (b. 1894), succeeded to the throne on the death of his father, George V., Jan. 20, 1936; Prince of Wales 1911–36. Abdicated in favour of his brother H.R.H. the Duke of York Dec. 10, 1936, and was created Duke of Windsor. Governor of the Bahamas 1940–45.

Edwin (585–633), King of Northumbria, killed in battle at Hatfield Chase, Yorkshire, in 633. He was baptised into the Christian faith at York in 627, and built a church there.

Egbert was a descendant of Cerdic, king of the West Saxons, and reigned from 802 to 839 in Wessex; in his later years became the first king of all England. In 835 he had to drive the Northmen away from Cornwall.

Ehrlich, Paul (1854–1915), a noted German scientist who was Director of the Royal Institute for Experimental Therapeutics at Frankfurt-on-Main, which he made famous by his experimental laboratory work in connection with cancer. His prolonged experimental researches brought him world-wide renown, his greatest triumphs being the discovery of salvarsan and neo-salvarsan. He received the Nobel Prize in 1908.

Eiffel, Alexandre Gustave (1832–1923), French engineer, one of the first to employ compressed-air caissons in bridge building. Among his notable works are the great Eiffel Tower, Paris (1887–89) and the Panama Canal Locks.

Einstein, Albert (1879–1955), one of the greatest men of science of all time, whose chief claim to fame rests upon his theories of relativity. He was born in Ulm of Jewish parents and lived for many years in Switzerland. Awarded the Nobel Prize in 1921 for his work in quantum theory. In 1933 he was driven by the Nazis to seek asylum in America and became a professor at the Institute for Advanced Study at Princeton, 1933–45. His works include *Relativity* (1920), *Zur Einheitlichen Feldtheorie* (1929), *About Zionism* (1930), *The Evolution of Physics* (1938), *The Meaning of Relativity* (1950), *Out of My Later Years* (1950).

Eisenhower, Gen. Dwight David, G.C.B., O.M. (b. 1890). Republican President of the United States, 1953–61. Supreme Commander Atlantic Forces in Europe 1950–52. U.S. Chief of Staff, 1945–48. C.-in-C. Allied Forces, European theatre of operations, 1943–45, and Allied Forces, N. Africa, 1942–43. Pres. Columbia Univ., 1948–50.

Eisenstein, Sergei Mikhailovich (1898–1948), Russian film director, whose silent film classic *The Battleship Potemkin* brought him world-wide fame. He also produced *Alexander Nevsky* and *Ivan the Terrible*.

Eleanor, Queen of Edward I. (d. 1290), was a woman of great piety and devotion. After her death the king had memorial crosses erected at the twelve places where her body rested on its way from Grantham to Westminster.

Elgar, Sir Edward, Bart., O.M., G.C.V.O. (1857–1934), English composer and Master of the King's Musick, 1924–34. Starting as a violinist and a teacher, he composed many choral-orchestral works for various festivals and sprang to fame with the *Enigma Variations*, musical portraits of his friends. Other compositions include the oratorios, *The Kingdom*, *The Apostles* and *The Dream of Gerontius* and the tone-poem *Falstaff*. *See* Section E.

Elgin, Thomas Bruce, 7th Earl of, P.C. (1766–1841), a British diplomatist who brought to England from Athens the famous " Elgin marbles," now in the British Museum.

Eliot, George (1819–1880), the pen name of Marian Evans, who produced some of the most memorable novels of the 19th century, including *Adam Bede*, *The Mill on the Floss*, *Silas Marner*, *Middlemarch* and *Daniel Deronda*.

Eliot, Thomas Stearns, O.M. (1888–1965), poet and critic, one of the foremost literary figures of the 20th century. He was born in St. Louis, Missouri, came to London during the First World War, and became a British subject in 1927. His poems include *Prufrock*, *The Waste Land*, *The Hollow Men*, *Ash Wednesday*, *Four Quartets*, and *Little Gidding*; his verse dramas include *Murder in the Cathedral*, and *The Family Reunion*. He described himself as " classicist in literature, royalist in politics, and Anglo-

Catholic in religion." Awarded 1948 Nobel Prize for Literature. *See also* Section I.

Elizabeth (b. 1900), Queen Consort of George VI., daughter of the 14th Earl of Strathmore. Before her marriage in 1923 she was Lady Elizabeth Angela Marguerite Bowes-Lyon. Chancellor, Univ. of London, Univ. of Dundee.

Elizabeth I. (1533–1603) came to the throne in 1558 at the age of twenty-five, and reigned forty-five years. Was a fervid Protestant, a sincere lover of her country, a masterful and enlightened ruler—fickle as far as her favourites were concerned—and added distinction to a distinguished period. The defeat of the Spanish Armada, the execution of Mary Stuart, the naval supremacy of England, the extension of her colonies, and the glory of a great new literature of which Shakespeare was the brightest ornament are features associated with her reign.

Elizabeth II. (Elizabeth Alexandra Mary of Windsor) (b. 1926), ascended the throne in February 1952 at the age of twenty-five on the death of her father George VI. Her Consort, Prince Philip, Duke of Edinburgh, is the son of Prince Andrew of Greece and a descendant of the Danish royal family. They have four children, Charles, Prince of Wales (b. 1948), Princess Anne (b. 1950), Prince Andrew. (b. 1960), and Prince Edward (b. 1964).

Ellis, (Henry) Havelock (1859–1939), literary and scientific writer and an authority on sex.

Emerson, Ralph Waldo (1803–1882), the American essayist and philosopher. His *Conduct of Life*, *Representative Men*, and *Essays*, are among the most brilliant literary productions of America.

Emin Pasha, the name adopted by Eduard Schnitzer (1840–92), a German explorer associated with Gen. Charles Gordon in the pacification of the Sudan. He joined Gordon's forces as a medical officer and showing marked administrative ability was made governor of the Equatorial Province in 1878. He was menaced by the Mahdi and rescued by Stanley in 1889. While engaged in exploration for Germany in the region of Lake Tanganyika he was murdered by Arabs.

Emmet, Robert (1778–1803), the enthusiastic youth who led the rebellion in Ireland in 1803 and was tried and executed in the same year for high treason. He is one of Ireland's patriot heroes.

Empedocles (*c.* 500–*c.* 430 B.C.), Greek philosopher, b. Agrigentum in Sicily, founder of a school of medicine which regarded the heart as the seat of life, an idea which passed to Aristotle, as did his idea that all matter was composed of four elements: earth, air, fire, and water. He was also a poet.

Engels, Friedrich (1820–1895), Socialist writer and lifelong friend of Karl Marx with whom he collaborated in producing the Communist Manifesto of 1848. *See also* Marxism, J27.

Epictetus of Hierapolis, the Stoic philosopher, who lived in the 1st century, and was a moral teacher of great repute and influence.

Epicurus (342–270 B.C.), the founder of the Epicurean philosophy, which taught that virtue should be followed because it leads to happiness.

Epstein, Sir Jacob, K.B.E. (1880–1959), sculptor, born in New York of Russian-Polish parents. His work includes *Rima*, the Hudson memorial in Hyde Park; *Day* and *Night* on the building of the Underground Headquarters at St. James' Park; *Genesis*, exhibited in 1931; *Lazarus*, which has a fine setting in New College, Oxford; the *Madonna and Child* group for the restored 18th cent. buildings in Cavendish Square; the figure of *Christ in Majesty*, cast in aluminium, in Llandaff Cathedral; a monumental sculpture for the T.U.C. headquarters in London, and a bronze group depicting St. Michael triumphing over the Devil for Coventry Cathedral, his last major work.

Erasmus Desiderius (1466–1536), the great Dutch philosopher and scholar, of whom it was said that he "laid the egg which Luther hatched."

Erhard, Dr. Ludwig (b. 1897), German economist and politician; succeeded Adenauer as Chanc. of the West German Federal Republic, 1963–7.

Ericsson, John (1803–1889), Swedish engineer who entered into competition with George Stephenson in the first famous trial of locomotives.

Ervine, St. John Greer (b. 1883), author, dramatist and critic, noted as an able controversialist.

Essex, Robert Devereux, 2nd Earl of (1566–1601), the favourite of Queen of Elizabeth in her old age, son of Walter Devereux (1541–76) and stepson of Leicester. Proved an incapable governor-general of Ireland, returning to England against the Queen's express wish. He was imprisoned and executed for organising a rebellion in London.

Ethelbert, King of Kent at the close of the 6th century and commencement of the 7th. Famous for having accepted Christianity on the entreaty of St. Augustine. Published the first code of written laws in English. Canonised later.

Ethelred II. (*c.* 968–1016), became king of England on the murder of his half-brother, Edward the Martyr (978). He was an incompetent ruler and unable to organise resistance against the Danish raids. Called "the Unready" (from Old Eng. uræd = without counsel).

Ethelwulf was the Anglo-Saxon sovereign who succeeded his father Egbert in 837. Died in 857, and was buried at Winchester.

Etty, William (1787–1848), a famous English R.A., who contributed to the Royal Academy some of its most admired pictures between 1820 and 1849.

Eucken, Rudolf Christoph (1846–1926), a famous German philosopher and theologian.

Euclid (*c.* 330–*c.* 260 B.C.), illustrious Greek mathematician whose *Elements of Geometry* remained a standard text-book until the present century.

Euler, Leonhard (1707–83), Swiss mathematician, regarded as the founder of pure mathematics. He was called by Catherine I. to St. Petersburg, where he became Professor, 1730–41.

Euripides (480–406 B.C.), the greatest of Greek tragic poets. He wrote 92 plays, 18 of which have been preserved, the most famous being *Alcestis*, *Medea*, *Iphigenia*, and *Orestes*.

Eusebius (264–340), an ecclesiastical historian whose *Chronicon* is a history of the world down to his own time, while his *Ecclesiastical History* traces the chief events of the Christian Church.

Evans, Sir Arthur John (1851–1941), distinguished archæologist, chiefly famed for his excavations at Knossos in Crete and his discovery of the pre-Phœnician script.

Evans, Dame Edith Mary, D.B.E. (b. 1888), the versatile and brilliant English actress who made her first appearance as Cressida in *Troilus and Cressida* in 1912. She has played many leading roles and has also appeared in films.

Evatt, Rt. Hon. Herbert Vere, M.A., LL.D. (1894–1965), Australian lawyer and politician; Min. for External Affairs 1941–49; leader of the Federal Labour opposition, 1951–60; Chief Justice, New South Wales, 1960–2.

Evelyn, John (1620–1706), was one of the founders of the Royal Society and wrote several scientific works, but is best remembered for his *Diary* which covers the period 1640–1706.

Eyck, Hubert van (*c.* 1366–1426), and **Eyck, Jan van** (*c.* 1386–1440), two of the greatest masters of the early Flemish School of Painters.

Fabius Maximus (Cunctator) (d. 203 B.C.), the Roman Consul and Dictator, saved Rome from conquest by Hannibal by deliberate and well-planned strategic evasion of battle. The term "Fabian Policy" is derived from Fabian's tactics.

Fabre, Jean Henri Casimir (1823–1915), French naturalist whose lifelong interest was the study of the habits of insects and whose observations were delightfully recorded in his *Souvenirs entomologiques*, a work of many volumes.

Faed, Thomas, R.A. (1826–1900), one of the most successful of Victorian painters, won a great reputation for his Scottish subjects.

Fahrenheit, Gabriel Daniel (1686–1736), German physicist, born in Danzig, improved construction of thermometers, notably in using quicksilver for alcohol. Devised the scale with freezing-point at 32° boiling-point at 212°.

Fairbairn, Sir William, 1st Bt., F.R.S. (1789–1874), mechanical engineer and inventor. By the first utilisation of iron in shipbuilding, became eminent and wealthy.

Fairfax, Thomas, 3rd Lord (1612–1671), a promi-

nent leader of the Parliamentary army during the Civil War, who greatly distinguished himself at Marston Moor and Naseby.

Falla, Manuel (1876–1946), Spanish composer whose music is highly individual with a strong folk-song element. His compositions include operas, ballets (*The Three-Cornered Hat* was one of Diaghilev's greatest successes), piano music, pieces for piano and orchestra, songs, harpsichord concerto, and guitar solo in memory of his friend Debussy. *See* **Section E.**

Faraday, Michael, F.R.S. (1791–1867), great experimental physicist, founder of the science of electromagnetism. He was the son of a Yorkshire blacksmith and at 13 became apprenticed to a bookseller in London. In 1813 he became laboratory assistant to Sir Humphry Davy at the Royal Institution, becoming professor of chemistry there in 1833. He was one of the world's most brilliant experimenters and set himself the problem of finding the connections between the forces of light, heat, electricity, and magnetism. The epoch-making discoveries he made form the basis of the modern electrical industry. He lectured superbly well and inaugurated the Christmas lectures for juvenile audiences at the Royal Institution. Standard biography by L. Pearce Williams (1965).

Farman, Henri (1874–1958), French aviator, one of the pioneers of aviation and a famous designer and builder of aeroplanes.

Farouk I (1920–65), King of Egypt, 1936–52. Forced to abdicate as a result of a military *coup d'état* in July 1952.

Farrar, Very Rev. Frederic William, D.D., F.R.S. (1831–1903), Dean of Canterbury, 1895–1903; a divine and author, some of whose writings attained a large circulation and exercised a considerable influence. His most popular publications were *The Life of Christ*, *The Life and Works of St. Paul*, and *Early Days of Christianity*. Author of the schoolboy story *Eric*.

Faulkner, William (1897–1962), American novelist, recognised as one of the great writers of the century, whose series of novels *The Sound and the Fury*, *As I Lay Dying*, *Light in August*, *Sanctuary* (which brought a Nobel Prize) give a vivid picture of the American South. *See* **Contemporary Novel, Section M.**

Fauré, Gabriel Urbain (1845–1924), French composer and teacher; pupil of Saint-Saëns. He was much revered by his pupils at the Paris Conservatoire, among whom was Ravel. His works include chamber music, nocturnes and barcarolles for piano, an opera, *Pénélope*, some exquisite songs, and *Requiem*. *See* **Section E.**

Fawcett, Rt. Hon. Henry (1833–84), blind Liberal statesman and economist; Prof. of Political Economy at Cambridge. Author of *Manual of Political Economy* (1863).

Fawcett, Dame Millicent Garrett, G.B.E. (1847–1929), widow of the above; educational reformer and leader of the movement for women's suffrage; a very able writer on political economy and one of the founders of Newnham College, Cambridge.

Fawkes, Guy (1570–1606), a Yorkshire Catholic, who with Catesby and other conspirators planned the Gunpowder Plot. Although warned of the discovery of the plot, Fawkes persisted and was captured in the cellar of the Parliament House and hanged. (*See* **Gunpowder Plot, General Information section.**)

Fénelon, François de Salignac de la Mothe (1651–1715), Archbishop of Cambrai and a writer of distinction. His *Telemachus* is a French classic.

Ferdinand V. of Aragon (1452–1516), who married Isabella of Castile, and with her reigned over Spain during a period of great events. He saw the Moors expelled from Spain, equipped Columbus for the discoveries which led to Spain's vast colonial possessions, and instituted the Inquisition.

Ferguson, James, F.R.S. (1710–1776), a Banffshire man of great ability and inventiveness, who, from being a shepherd-boy, educated himself in astronomy, mathematics, and portrait painting, so that he was able to support his parents, and became eminent as a scientific lecturer. He was made a Fellow of the Royal Society.

Fermi, Enrico (1901–54), Italian nuclear physicist whose research contributed to the harnessing of atomic energy and the development of the atomic bomb. Prof. of Physics at Rome, Columbia Univ., New York, and Univ. of Chicago. He postulated the existence of the neutrino and discovered the element Neptunium. Awarded the 1938 Nobel Prize in Physics.

Festing, Field Marshal Sir Francis Wogan, G.C.B., K.B.E., D.S.O. (b. 1902), Chief of Imperial General Staff, 1958–61. During the war he commanded the 36th Division in Burma; known to his troops as the "front line general."

Feuchtwanger, Dr. Lion (1884–1958), German-Jewish author famous for his historical novels, such as *Jew Süss* and *'Tis Folly to be Wise*.

Fichte, Johann Gottlieb (1762–1814): was Professor of Philosophy, first at Jena and then at Erlangen, and later Rector of the University of Berlin. His works had great influence upon the thought of his time and prepared the way for the later Hegelian dialectic.

Field, John (1782–1837), composer and pianist, born in Dublin; pupil of Clementi and teacher of Glinka. At early age travelled Europe as virtuoso pianist. Composed seven concertos, three sonatas, and numerous piano pieces. Chopin's nocturnes were modelled on those of Field. The later part of his life was spent in Moscow, where he died.

Fielding, Henry (1707–1754), a celebrated English novelist, author of *Tom Jones*, *Joseph Andrews*, and *Amelia*, as well as many plays.

Fields, Gracie, C.B.E. (b. 1898), an inimitable Lancashire comedienne, and a great popular favourite with the British public. Made her first London appearance in 1915. Equally successful on the films as on the stage, she gained the affections of her music hall audiences through her abundant vitality, her Lancashire humour and her remarkably flexible voice.

Fildes, Sir Luke, K.C.V.O., R.A. (1844–1927), first attracted notice as a black-and-white artist, and illustrated Dickens' *Edwin Drood*. Exhibited at the Royal Academy in 1872, and at successive exhibitions was represented by many important works.

Finsen, Prof. Niels Ryberg (1860–1904), a Danish physician whose light-ray treatment of *lupus vulgaris* won the approval of Queen Alexandra and the aid of many philanthropists. He established in Copenhagen an institute for light therapy. Inventor of the Finsen ultra-violet lamp. Awarded 1903 Nobel Prize for Medicine.

Firdousi, *nom de plume* of **Abdul Kasim Mansur** (*c.* 930–1020), Persian poet whose great epic *Shahnama*, or *Book of Kings*, relates the history of Persia in 60,000 verses.

Fisher of Lambeth, Baron (Most Rev. Geoffrey Francis) P.C., G.C.V.O., M.A., Hon. D.D. (b. 1887). Archbishop of Canterbury, 1945–61, the 99th holder of the office; Bishop of London, 1939–45; Bishop of Chester, 1932–39; Headmaster Repton School, 1914–32.

Fisher, Rt. Hon. Herbert Albert Laurens, O.M., F.R.S. (1865–1940), English historian and educational reformer; author of *A History of Europe*.

Fisher, Professor Sir Ronald Aylmer, Sc.D., F.R.S. (1890–1962), one of the greatest of British scientists who revolutionised both genetics and the philosophy of experimentation by founding the modern corpus of mathematical statistics.

FitzGerald, Edward (1809–1883), English poet who gained world-wide fame by his translation of the *Rubaiyát* of Omar Khayyam (1859).

Fitzroy, Vice-Admiral Robert, F.R.S. (1805–1865) Attained celebrity as a meteorologist, and in 1854 was made superintendent of the Meteorological Department, and was the introducer of the system of storm warnings which were the beginning of weather forecasts.

Flammarion, Camille (1842–1925), French astronomer, famous for his observations on double stars, star-drift and popular lectures and books on astronomy. Founded the Astronomical Society of France in 1887. His best-known work is *L'Astronomie Populaire*.

Flamsteed, John, F.R.S. (1646–1719), was the first English Astronomer Royal, and a close friend of Sir Isaac Newton, whom he aided in many of his experiments.

Flaubert, Gustave (1821–80), one of the greatest of French novelists and creator of *Madame Bovary* which took five years to write. His perfection of style was attained only through

unremitting effort. Other works were *Salammbo*, *L'Education sentimentale* and *Bouvard et Pécuchet*.

Flaxman, John R.A., (1755–1826), a great English sculptor who was born at York, and at 20 was employed as modeller by Josiah Wedgwood. In 1787 he went to Rome, where he stayed 7 years. In 1800 he was elected R.A. and in 1810 became professor of sculpture to the Royal Academy.

Flecker, James Elroy (1884–1915), English poet whose works include *Golden Journey to Samarkand*, *Hassan* (staged in London, 1923) and *Don Juan*, as well as many lyrics.

Fleming, Sir Alexander, F.R.S. (1881–1955), as a bacteriologist he made many original contributions, including the discovery of the antibacterial enzyme lysozyme in 1922 and penicillin in 1928. Full recognition of his discovery came only during the war, when Florey separated the drug now used for treatment from the original penicillin. Awarded Nobel Prize for Medicine jointly with Florey and Chain, 1945.

Fleming, Sir (John) Ambrose, F.R.S. (1849–1945), British scientist whose invention of the radio valve in 1904 was destined not only to revolutionise radio telegraphy but also to solve the problems which had so far prevented the successful development of radio-telephony, and eventually to make possible the transmission of high-quality speech, music, and even vision signals, and thus lead to broadcasting and television.

Fletcher, John (1579–1625), the famous collaborator with Beaumont in numerous plays which were popular in their day and take high position in the dramatic literature of the country.

Flinders, Matthew (1774–1814), an explorer and navigator, who made important discoveries in and around Australia. He sailed through Bass Strait so called in honour of his surgeon. Sir William Matthew Flinders Petrie (*q.v.*), the archaeologist was his grandson.

Florey, Baron, Howard Walter, O.M. (b. 1898), British pathologist, b. Australia; co-discoverer of penicillin. Shared 1945 Nobel Prize with Fleming and Chain. Pres. Royal Society, 1965.

Foch, Marshal Ferdinand, O.M. (1851–1929), Generalissimo commanding the Allied Forces in France from April 1918 until after the Armistice was signed, Nov. 11, 1918. Under his direction the great German offensive was checked and turned at the Marne in July 1918. He followed up this success with a series of rapid attacks culminating in the German surrender, Nov. 11, 1918, when he imposed the conditions of the Armistice.

Fokine, Michel (1880–1944), famous Russian dancer who became choreographer to Diaghilev's company. Creator of *Les Sylphides*, *Prince Igor*, *Scheherazade*, *Firebird*, and *The Spectre of the Rose*.

Fokker, Anton Hermann Gerard (1890–1939), Dutch (naturalised American) airman and aeronautical engineer, designer and builder of the well-known Fokker triplanes and biplanes employed by the German army.

Fonteyn, Dame Margot (Mme. Roberto de Arias), D.B.E. (b. 1919), Prima ballerina of the Royal Ballet (formerly Sadler's Wells Ballet) and acclaimed foremost English dancer of to-day.

Ford, Henry (1863–1947), founder of Ford Motor Co., 1903, of which he was President until 1919, when he was succeeded by his son, Edsel B. Ford (1893–1943). Henry Ford became the world's leading industrialist and its second richest man. Was the pioneer of the cheap motor-car, of which, since 1920, more than a million have been produced annually.

Forester, Cecil Scott (b. 1899), British novelist, author of the *Captain Hornblower* series.

Forster, Edward Morgan, C.H., LL.D., C.L. (b. 1879), English novelist whose novels *A Room with a View*, *Howards End*, *A Passage to India*, have given him great authority in the world of literature. *See also* Contemporary Novel, Section M.

Foscari, Francesco (c. 1372–1457), Doge of Venice from 1423 to 1457. A great historical character, who governed Venice with a firm hand and increased her renown.

Fosdick, Rev. Harry Emerson (b. 1878), American Baptist preacher. Professor of Theology, Union Theological Seminary, New York, and Pastor, Riverside, formerly Park Avenue, Baptist Church, New York, 1926–46.

Fourier, François Charles Marie (1772–1837), the famous French socialist, who propounded a system of associated enterprise for giving everyone ample means on a system of communal industry. He made some attempts to carry out his Utopian ideas, but they did not succeed. He is best known by his *Traité de l'Association Domestique Agricole*.

Fowler, Sir John, Bart., K.C.M.G. (1817–1898), an eminent civil engineer, son of a Sheffield land surveyor. With Sir Benjamin Baker he was the engineer of the Forth Bridge and of the Metropolitan Railway.

Fox, Rt. Hon. Charles James (1749–1806) was the second son of the first Lord Holland. Entered Parliament at nineteen, and became a Lord of the Admiralty in 1770. His opposition to the Royal Marriage Bill drew down upon him the displeasure of George III. Through the whole of Pitt's Premiership he was that statesman's most formidiable opponent. He favoured American Independence; opposed the war with France; was one of the impeachers of Warren Hastings; denounced the Slave Trade and advocated Parliamentary Reform. After the death of Pitt in 1806 he was made Foreign Secretary, but died a few months later, and was buried in Westminster Abbey.

Fox, George (1624–1691), was the founder of the Society of Friends.

Foxe, John (1516–1587), the English martyrologist, whose *Acts and Monuments* (*Book of Martyrs*) is one of the best-known books in the language. Born at Boston in Lincolnshire, he became a clergyman of the Anglican Church and died in London.

Frampton, Sir George James, R.A., F.S.A. (1860–1928). English sculptor, best remembered by his Peter Pan statue in Kensington Gardens, and the Edith Cavell Memorial in St. Martin's Place, London.

France, Anatole (Jacques Thibault) (1844–1924), one of France's notable writers of fiction, showing a great mastery of character portrayal and satire. Most of his works are translated into English.

Francis I. (1494–1547), King of France (1515–47). Recovered Milan from Swiss at Marignano (1515). Tried to gain support of Henry VIII (Field of the Cloth of Gold, 1520). Contested supremacy in Europe of Hapsburg emperor, Charles V; defeated and captured at Pavia (1525). French renaissance flourished during his reign.

Francis of Assisi, Saint (1181/82–1226), one of the great Christian saints, founder of the Franciscan Order. Son of a wealthy cloth-merchant of Assisi, he underwent a conversion in 1208 and turned from a life of pleasure to follow the life of the gospel, committing himself to poverty and to the complete observance of Christ's teaching. He and his friars went about preaching the gospel by word and example and the brotherhood increased rapidly in numbers. He received the stigmata (the marks of the five wounds of Christ) on Monte La Verna in Tuscany on 14 Sept. 1224. The last years were spent in illness; he was canonized by his friend Gregory IX two years after his death.

Francis, Sir Philip, K.B. (1740–1818), an English statesman, the reputed author of the famous *Letters of Junius*.

Franck, César Auguste (1822–90), composer and organist, born at Liége in Belgium. From 1872 until his death was professor of organ at the Paris Conservatoire. His music is romantic, mystical, and personal in idiom. Much of his finest composition is for the organ, and his *Symphonic Variations for Piano and Orchestra*, *Sonata for Violin* and the *Symphony in D* rank him, with his younger contemporary Debussy, among the great 19th-cent. musicians.

Franco, General Francisco (b. 1892), Spanish soldier and Dictator who served with the Spanish Forces in the Moroccan campaign of 1920–23 and was later Head of the Military Academy at Saragossa. Chief of the General Staff 1935–36. Was Commander-in-Chief of the Nationalist Forces during the Spanish Civil War, 1936–39. President of Spain since Aug. 1939.

Franklin, Benjamin, F.R.S. (1706–1790), the

famous American statesman and philosopher, who after serving an apprenticeship as a printer attracted public attention by publishing his *Poor Richard's Almanac*. He then began a series of scientific experiments, inventing among other things the lightning conductor. He was for ten years a member of the General Assembly; then lived in Britain as agent for his State for eighteen years; returning to America he took part in framing the Constitution of the United States.

Franklin, Rear-Admiral Sir John, F.R.S. (1786–1847), the famous Arctic explorer, whose final expedition in command of the *Erebus* and *Terror* ended disastrously, all the members of the expedition perishing. Many attempts were made to discover Franklin, but without obtaining anything save very fragmentary knowledge concerning his fate. He was born at Spilsby.

Franks, Rt. Hon. Sir Oliver Shewell, G.C.M.G., K.C.B., C.B.E., M.A. (b. 1905), British Ambassador to U.S.A. 1948–52; Provost of Worcester College, Oxford, 1962. Chanc. Univ. of East Anglia, 1965.

Fraser of the North Cape, Admiral of the Fleet, Lord, G.C.B., K.B.E. (b. 1888), commanded Home Fleet, Eastern Fleet, and British Pacific Fleet successively, 1943–46. First Sea Lord, 1948–51.

Fraser of Lonsdale, Ian, Baron, C.H., C.B.E. (b. 1897). Chair. St. Dunstan's since 1921; Pres. British Legion, 1947–58; B.B.C. Gov., 1937–39 and 1941–46. Life peerage conferred, 1958.

Fraunhofer, Joseph von (1787–1826), famous optical instrument maker of Munich, the first to map the dark lines of the solar spectrum named after him.

Frazer, Sir James George, O.M., LL.D., F.R.S. (1854–1941), was an eminent British anthropologist; author of *The Golden Bough* and numerous other works on his subject.

Frederick I. (*c.* 1123–90), Holy Roman emperor from 1152. Nicknamed Barbarossa. A commanding personality, he won for the empire prestige unknown since Otto the Great. Though failing to subjugate his Italian territories, for his armies suffered from the Italian climate, he dominated his German subjects, expelled the semi-independent Duke of Saxony, Henry the Lion, from his duchy, encouraged the German cities, and was a national hero. Though not an ascetic, he was remarkable for an impeccable private life, distinguished himself on the second Crusade, and was drowned in Asia Minor on his way to the third.

Frederick II. (1194–1250), Holy Roman Emperor, an enlightened ruler whose court in Sicily was a centre of culture and learning, attracting Jewish, Mohammedan, and Christian scholars. Forced by illness to return from crusade in 1227, he was excommunicated by Pope Gregory IX.; still excommunicated, he again set sail for Palestine and by skilful diplomacy gained possession of Jerusalem, Bethlehem, and Nazareth. Frederick was a philosopher and man of science and delighted in exploding superstition. He founded the university of Naples, was a patron of the medical school at Salerno, wrote a treatise on falconry, and gave Sicily a code of laws.

Frederick II. or Frederick the Great (1712–86), King of Prussia (1740–86). By his masterful government and military successes he raised Prussia to the rank of a great power. He was a scholarly potentate, composed music and played the flute.

French, Field-Marshal Sir John. (*See* **Ypres, 1st Earl of.**)

Freud, Sigmund, M.D. (1856–1939), was Professor of Neurology, Vienna University, 1902–38. An eminent psychoanalyst; author of many books on his subject. Left Austria after the *Anschluss* to take up permanent residence in England. An account of Freudian theory will be found in Section F, Part III.

Freyberg, 1st Baron, Lieut.-Gen. Bernard Cyril, V.C., G.C.M.G., K.C.B., K.B.E., D.S.O. (1889–1963), Gov.-Gen. of New Zealand, 1946–52. Served with distinction in both world wars. Commanded Allied troops on Crete, 1941. Won third bar to D.S.O. in Italy, 1945.

Friese-Greene, William (1855–1921), inventor of the cinematograph. His pioneer work in commercial photography brought him no profit, and for many years he lived in poverty.

Frobisher, Sir Martin (1535–1594), was the earliest of British navigators to attempt to find the North-West passage from the Atlantic to the Pacific through the Arctic seas, and his name is commemorated in Frobisher's Strait, to the south of Baffin Land. For his services in connection with the defeat of the Spanish Armada he was knighted.

Froebel, Friedrich Wilhelm August (1782–1852), was the founder of the Kindergarten system of education, the object of which is "to give children employment in harmony with their nature, to strengthen their bodies, to exercise their senses and lead them up to the original ground of all life, to the idea of unity with themselves." *See also* J14(2).

Froissart, Jean (1337–1410), a celebrated French writer who visited England and Scotland, and was the author of the famous *Chronicles*, which tell us so much of the achievements of the barons of old.

Frost, Robert (1874–1963), best loved of American poets. "Stopping by Woods on a Snowy Evening"; "Birches"; "The Death of the Hired Man"; "After Apple-Picking". Awarded Pulitzer Prize for poetry in 1924, 1931, 1937, and 1943.

Froude, James Anthony (1818–1894), the celebrated historian and biographer of Carlyle.

Fry, Christopher (b. 1907), English poet and dramatist of Quaker family. Author of *The Lady's Not for Burning*, *Venus Observed*, and *The Dark is Light Enough*. *See also* **Modern Drama.**

Fry, Elizabeth (1780–1845), a Norwich lady who devoted much of her life to the promotion of prison reform, and achieved considerable reputation as a preacher. She belonged to the Society of Friends.

Fry, Roger (1866–1934), English art critic and painter. Introduced the work of Cézanne and the post-impressionists into England. His most important book is *Vision and Design*. Biography by Virginia Woolf (1940).

Fuchs, Sir Vivian Ernest, M.A., Ph.D. (b. 1908), British geologist and explorer. Dir. of the Falkland Islands Dependencies Scientific Bureau since 1951; leader of the British Commonwealth Trans-Antarctic Expedition 1957–58, the first to cross the Antarctic continent.

Fuller, Thomas (1608–1661), the author of *Worthies of England* and a *Church History of Britain*, two well-known and valuable works.

Fulton, Robert (1765–1815), an inventive American engineer who distinguished himself by experiments in the application of steam to navigation, and finally in 1807, launched the *Clermont* on the Hudson.

Furniss, Harry (1854–1925), British caricaturist, was born in Wexford and came to London as a young man. He was a famous cartoonist and served on the staff of *Punch* from 1878–94. Illustrated the works of Dickens and Thackeray.

Furtwängler, Wilhelm (1886–1954), famous German conductor, and popular in Great Britain for his visits with the Berlin Philharmonic Orchestra, of which he succeeded Herr Nikisch as conductor.

G

Gade, Niels Vilhelm (1817–90), Danish composer. While studying at Leipzig he met Mendelssohn, whom he succeeded as conductor of the Gewandhaus orchestra. He wrote eight symphonies, chamber music, and choral works. Though characteristically Scandinavian, his work shows the influence of German romanticism.

Gagarin, Yuri Alexeyevich (1934–68), Soviet airman who stirred the imagination of the world on 12 April 1961 by being the first man to be launched into space and brought safely back. His flight was made in the front portion of a Soviet multi-stage rocket which made a single circuit of the earth, the whole adventure taking 108 minutes. Killed in air crash.

Gainsborough, Thomas, R.A. (1727–1788), English landscape and portrait painter, whose works are remarkable for their grace and refinement. He was born in Sudbury in Suffolk, the youngest of nine children of a cloth-merchant.

Gaiseric or Genseric (*c.* 390–477), king of the

Vandals, the ablest of the barbarian invaders of the Roman empire. He led his people from Spain into Africa, took Carthage, gained control of the Mediterranean by his pirate fleets, and sacked Rome in 455, thereby bringing about the fall of the western empire.

Gaitskell, Rt. Hon. Hugh Todd Naylor, C.B.E. (1906–63), statesman and economist; leader of the Labour Opposition, 1955–63; Min. of Fuel and Power, 1947–50; Min. of State for Econ. Affairs, 1950; Chan. of the Exchequer, 1950–51; M.P. (Labour) for South Leeds, 1945–63. He was succeeded as leader of the Labour Party by Harold Wilson. *See also* Section C, Part I.

Gale, General Sir Richard, G.C.B., K.B.E., D.S.O., M.C. (b. 1896), Commander of 6th Airborne Div. which landed in Normandy in June 1944; C.-in-C. B.A.O.R., 1952–56; Dep. Supreme Allied Commander Europe (NATO), 1958– .

Galen, Claudius (A.D. 131–201), physician, b. Pergamum (Asia Minor) of Greek parents. He systematised medical knowledge in accordance with his idea of purposive creation by the will of God. This unscientific attitude, by discouraging original investigation, hampered medical progress for a thousand years. Many of his treatises still survive.

Galileo (1564–1642), great Italian scientist whose experimental-mathematical methods in the pursuit of scientific truth laid the foundations of modern science. He became professor of mathematics at Pisa university when he was 25 and lectured at Padua university for 18 years. He made a number of fundamental discoveries, *e.g.*, in regard to the hydrostatic balance, thermometer, magnet, telescope, and foreshadowed Newton's laws of motion. He detected the four major satellites of Jupiter, the ring of Saturn, and the spots of the sun. He proved the superiority of the Copernican over the Ptolemaic theory, and was imprisoned for so doing. He died the year Newton was born.

Galsworthy, John, O.M. (1867–1933), an English novelist and dramatist of force and originality who wrote a great series of novels dealing with the history of an upper middle class family. Awarded Nobel Prize for Literature in 1932.

Galton, Sir Francis, F.R.S. (1822–1911), founder of eugenics, cousin of Darwin. His early work, *Meteorographica* (1863), contains the basis of the modern weather chart. He is also remembered for his device of finger-print identification and for being one of the first to apply mathematics to biological problems.

Galvani, Luigi (1737–1798), Italian physician and physiologist, whose experiments at Bologna university demonstrated the principle of animal electricity.

Gama, Vasco da (*c.* 1460–1524), the adventurous Portuguese navigator who discovered the sea route to India in 1498 by doubling the Cape of Good Hope.

Gandhi, Indira (b. 1917), daughter of Nehru, succeeded Shastri in 1966 to become India's first woman Prime Minister; formerly Pres. of Congress Party and Min. of Information.

Gandhi, Mohandas Karamchand (1869–1948), great Indian patriot, social reformer, and moral teacher. Believed in the doctrine of non-violence. In the tense situation following the granting of independence to India, he strove to promote the co-operation of all Indians but was assassinated on his way to a prayer meeting.

Garbo, Greta (b. 1905), Swedish film actress. The most arresting and poetical actress on the screen of her day.

Garcia, Manuel de Popolo Vicente (1775–1832), Spanish tenor, composer, and singing master. His son Manuel Patricio Rodrigues (1805–1906) was tutor to many celebrities including Jenny Lind. Both his daughters (Mme Malibran and Mme Viardot) were celebrated operatic singers.

Gardiner, Samuel Rawson (1829–1902), an English historian, whose works deal mainly with the period from the accession of James I. to the end of the Commonwealth. Many of his books remain the standard authorities on their subjects.

Garibaldi, Guiseppe (1807–82), Italian soldier and patriot, who with Mazzini and Cavour created a united Italy. In 1834 he was condemned to death for participating in a republican plot to seize Genoa but escaped to S. America. He returned in 1848 to fight for Mazzini but was again forced to flee. In 1851 he returned and gave his support to Cavour, taking part in the Austrian war of 1859. In 1860 with a thousand volunteers he freed Sicily, took Naples and handed over the Two Sicilies to Victor Emmanuel who was proclaimed King.

Garrick, David (1717–1779), the leading tragic actor of his time and a highly successful manager. Was buried in Westminster Abbey.

Garrison, William Lloyd (1805–1879), an eminent anti-slavery leader of America.

Gaskell, Mrs. Elizabeth Cleghorn (1810–1865), English novelist, author of *Mary Barton*, *Ruth Cranford*, and *Life of Charlotte Brontë*.

Gaudi i Cornet, Antonio (1852–1926), Spanish architect of great inventiveness, noted for the fantastic shape and decoration of his buildings which have many qualities in common with *Art Nouveau* (Spanish *modernismo*). He worked mainly in Barcelona.

Gauguin, Paul (1848–1903), influential French artist whose rejection of Western values led to his departure in 1891 for Tahiti where his greatest paintings were done.

Gaulle, Charles André Joseph Marie de (b. 1890), French general and statesman, chosen President of the Fifth Republic, Dec. 1958. On collapse of France in 1940 refused to surrender, but raised and led the Free French fighting forces, with headquarters in England. Took no part in parliamentary life from 1953 until June 1958, when a rebellion of colonists in Algeria brought him to supreme power. His system of government, based on personal prestige and skill in manoeuvre, has carried his country through many crises; the most serious was the army revolt in Algeria in April 1961 which he met and mastered. Repulsed Britain's attempts to enter the Common Market. *See also* Section C.

auss, Johann Karl Friedrich (1777–1855), great German mathematician and astronomer. The unit of magnetic induction is named after him.

Gautier, Théophile (1811–1872), French critic, novelist, and poet, at one time secretary to Balzac. His romance, *Mademoiselle de Maupin*, caused a great sensation.

Gay, John (1685–1732), English poet and playwright, famous for *The Beggar's Opera*. He was a writer of great wit and fancy, and much patronised by Society.

Gay-Lussac, Joseph Louis (1778–1850), a French chemist, whose experiments with gases were of much scientific importance.

Ged, William (1690–1749), was one of the inventors of the process of stereotyping. He was a goldsmith and a native of Edinburgh.

Geddes, Sir Patrick (1854–1932), Scottish scientist, professor of biology at Dundee for 30 years and a pioneer in town and regional planning. Invented the term "conurbation". Pubs. *City Development* and *Cities in Evolution*.

Geikie, Sir Archibald, O.M., K.C.B., F.R.S. (1835–1924), noted geologist; President of the Royal Society 1908–13. His brother James Geikie (1839–1915) was a specialist in glacial geology.

Geoffrey of Anjou, Duke of Brittany (1113–51), founder of the Angevin dynasty of England, was son-in-law of Henry I. and father of Henry II., the first Angevin or Plantagenet king.

Geoffrey of Monmouth (1100–1154), was the author of the famous Old English chronicle which bears his name. He was born at Monmouth, and became Bishop of St. Asaph in 1152. His *Chronicon* is a compilation from older authors, and is notable for having contained the stories of King Arthur, King Lear, and Cymbeline.

George I. (1660–1727) was King of Great Britain from 1714 to his death, ascending the throne as direct descendant of James I. His reign saw many memorable events, including the Jacobite Rebellion, the South Sea Bubble, and the beginning of Walpole's great ministry.

George II. (1683–1760), son of the last-named, was King of Great Britain from 1727 to 1760. His reign covered a prosperous period in spite of wars and rebellions, and saw the Empire extended in India and North America, though he himself was a man of limited powers.

George III. (1738–1820), grandson of George II., reigned 1760–1820. In this period came the King's clash with John Wilkes over foreign policy, the loss of the American colonies, the prolonged war with France, England's agrarian

and industrial revolutions, the spread of Methodism. In 1966 two British psychiatrists published convincing evidence that the King's long mental illness was due not to insanity but to acute intermittent porphyria, an inborn error of metabolism.

George IV. (1762–1830) eldest son of George III, reigned 1820–30, having become Prince Regent in 1812. The monarchy remained at a low ebb and was not to recover until after the accession of Victoria. Though styled "the first gentleman of Europe", his personal conduct, especially in marital affairs, showed a want of dignity. But he is now remembered for his interest in art and architecture.

George V. (1865–1936), was the second son of Edward VII. and Queen Alexandra. Entered the Navy as a cadet in 1877 and became second in the line of succession to the throne on the death of the Duke of Clarence in 1892. Married to Princess Mary of Teck in 1893. Succeeded to the throne May 6th, 1910, and celebrated his Silver Jubilee in 1935. Maintained the royal tradition of strenuous public engagements combined with unfailing attention to business of State.

George VI. (1895–1952), (Albert Frederick Arthur George of Windsor), second son of George V., was called to the throne in December 1936 on the abdication of his elder brother, Edward VIII. His reign was marked by the ordeal of war, by world revolution and social change and at the same time by a remarkable degree of constitutional harmony which his fine example and personal qualities did much to achieve.

George, Henry (1839–1897), American political economist whose "single tax" on land values as a means of solving economic problems is expounded in his *Progress and Poverty*, pub. 1879.

George, Saint, the tutelary saint of England, adopted by Edward III. He is believed to have been a native of Cappadocia and a vigorous champion of Christianity in the days of Diocletian, and to have suffered martyrdom at Nicomedia 303 A.D. The dragon which he is said to have slain symbolises the powers of evil over which he triumphed.

German, Sir Edward (1862–1936), English composer, best known for his incidental music and light opera *Merrie England*. (His name was originally Edward German Jones.)

Gershwin, George (1898–1937), American jazz pianist and song-writer, composer of the famous *Rhapsody in Blue* and other works including the negro "folk-opera" *Porgy and Bess*.

Gesner, Konrad von (1516–1565), a scholarly Swiss naturalist, and father of the science of zoology.

Ghiberti, Lorenzo (1378–1455), Florentine sculptor whose bronze doors, beautifying the baptistery in Florence, were described by Michaelangelo as fit for the gates of paradise.

Giacometti, Alberto (1901–66), Swiss sculptor and painter. He settled in Paris in 1922 and is considered one of the most important artists of modern times.

Gibbon, Edward (1737–1794), celebrated historian of the *Decline and Fall of the Roman Empire*.

Gibbons, Grinling (1648–1720), the celebrated wood-carver and sculptor, was born at Rotterdam and was brought to the notice of Charles II. by Evelyn, the diarist. The choir stalls of St. Paul's and the carving in the Wren library at Trinity College, Cambridge, are his work.

Gibbons, Orlando (1583–1625), a noted English composer of Church music who was organist of the Chapel Royal.

Gide, André Paul Guillaume (1869–1951) French man of letters, novelist, dramatist and poet. Awarded the Nobel Prize for Literature in 1947.

Gielgud, Sir (Arthur) John (b. 1904), English actor, member of the Terry family. Began by walking on at the Old Vic, and, later, became a Shakespearian actor, making a marked success as Hamlet, Richard II., and Prospero.

Gigli, Beniamino (1890–1957), the great Italian operatic tenor of the Metropolitan Opera House New York. The possessor of a voice of great natural beauty and one of the finest exponents of the music of Puccini and Verdi.

Gilbert, Sir Alfred, M.V.O., R.A., (1854–1934), sculptor and designer of gold and silver objects. Among his best-known sculptures are *Perseus Arming*, *Icarus*, *Eros* in Piccadilly Circus, the Shaftesbury Memorial and the Duke of Clarence Memorial at Windsor.

Gilbert, Sir Humphrey (1539–1583), knighted by Queen Elizabeth for his bravery in Ireland, later made voyages of discovery, and added Newfoundland to the British possessions.

Gilbert, Sir John, R.A. (1817–1897), English painter, one of the chief artists on the *Illustrated London News*, and noted for his illustrations to Staunton's edition of Shakespeare.

Gilbert, William (1543–1603), physician to Queen Elizabeth I., has been called the father of electric and magnetic science. Published his great book on the magnet in 1600.

Gilbert, Sir William Schwenck (1836–1911), English humorist and playwright, is best remembered for the "Bab Ballads" and for the famous Savoy series of operas in which he collaborated with Sir Arthur Sullivan. Among the operas are *H.M.S. Pinafore*, *Patience*, *Iolanthe*, *The Mikado*, *The Gondoliers*, and *The Yeomen of the Guard*. The Gilbertian humour of plot and paradox, the kindly satire and the delightful metres combine with Sullivan's music to make the operas unforgettable and ever popular.

Gill, Arthur Eric Rowton, A.R.A. (1881–1940), English sculptor and engraver, whose works include the *Stations of the Cross* (Westminster Cathedral), *Prospero and Ariel* (Broadcasting House), *Christ Driving the Money-changers from the Temple* (Leeds University). He also worked as a designer for printing (Gill Sans type) and the George VI stamps were his designs.

Gillray, James (1757–1815), the eminent caricaturist of the time of George III., who produced upwards of a thousand political cartoons.

Giotto di Bondone (*c.* 1266–*c.* 1337), great Florentine artist, the first to break away from byzantine tradition and paint in a naturalistic way. Much of his work has perished but still surviving are the great frescoes in the churches of Assisi, Padua, and Florence. He designed the western front of the cathedral at Florence and the campanile, the lower part of which was completed from his designs before his death.

Gissing, George Robert (1857–1903), English author whose novels deal with poverty and the sociological problems of his day. *New Grub Street*, *The Unclassed*, *Charles Dickens, A Critical Study*, *The Private Papers of Henry Ryecroft* are among his best-known works.

Giulio Romano or Giulio Pippi (*c.* 1492–1546) was a pupil of Raphael, and himself a distinguished painter and architect.

Gladstone, Rt. Hon. William Ewart (1809–98), the great Liberal statesman of the latter part of the nineteenth century, popularly known as the Grand Old Man. Entered Parliament in 1832 as a Tory, held various offices under Peel, and joined the Aberdeen coalition in 1852. From that time he served several terms as Chancellor of the Exchequer and was Liberal Prime Minister, 1868–74, 1880–85, 1886, and 1892–94. His financial policy was able, accurate, lucidly exposed, and very successful. His first ministry was active, its legislative achievements including the Disestablishment of the Church of Ireland, the Education Act of 1870, the Ballot Act of 1872, and the Irish Land Act, but in 1873 they were aptly described by Gladstone's great rival, Disraeli, as "exhausted volcanoes." His second ministry, returned to power after the astonishing Midlothian campaign, witnessed the defeat by the Boers at Majuba, the bombardment of Alexandria, and the disaster of General Gordon at Khartoum. His last two ministries were marked by the adoption of the policy of Home Rule for Ireland, which he was unable to carry. Gladstone was a good classical scholar and an earnest high churchman, who in 1838 published the *State in its Relations with the Church*, a work of considerable interest.

Glazunov, Alexander Constantinovich (1865–1936), Russian composer, pupil of Rimsky-Korsakov. He was an accomplished and prolific composer, the first of his eight symphonies being composed when he was only 16.

Glendower, Owen (1359–1415), a famous Welsh chieftain who proved a formidable opponent to Henry IV., and gathered around him a great following of Welshmen, whom he led with much bravery, though finally defeated in 1405.

Glinka, Mikhail Ivanovich (1804–57), Russian composer whose music has a strong folk-song element. Notable among his works are his two operas, *A Life of the Tsar* and *Russian and Ludmilla*, based on a poem by Pushkin. He is recognised as the first of the Russian national school. *See* Section E.

Gluck, Christoph Willibald (1714–87), German composer, a figure of great historical importance in the development of the opera. He was the son of a Bohemian forester and studied in Prague, Vienna, and Italy. His first operas were in the Italian tradition, but with *Orfeo ed Euridice* (1762), inspired by classical Greek drama, he began his reform of the opera. Then followed the great operas *Alceste*, *Armide*, and *Iphigénie en Tauride* (1779), which is considered his masterpiece. *See* Section E.

Godfrey of Bouillon (c. 1061–1100) was the leader of the First Crusade, and after the conquest of Jerusalem, exchanged the title of King for that of "Protector of the Holy Sepulchre." He liberated the Holy Land, and was buried on Mount Calvary.

Godiva, Lady (1040–1080), was the pious and beautiful wife of Leofric, Earl of Chester and Lord of Coventry. Having appealed to her lord to remit certain impositions from the inhabitants, he promised to grant her request if she would ride naked through the town. This she did, says the legend, having first passed the word to have blinds and shutters drawn at the appointed hour, and so obtained the people's ransom.

Godwin, Earl of the West Saxons (990–1053), was one of the most influential noblemen of his time and gave his daughter in marriage to Edward the Confessor, against whom he was afterwards in rebellion. Godwin's son, Harold, claimed the throne after Edward's death, but was killed at Hastings.

Godwin, William (1756–1836), English Radical philosopher, author of *Political Justice* and a novel, *Caleb Williams*. Married Mary Wollstonecraft (1759–97), author of *A Vindication of the Rights of Women*, in which she pleaded for the equality of the sexes, particularly in education. Their daughter, Mary Wollstonecraft Godwin (1797–1851), married the poet, Shelley, and was the author of *Frankenstein*.

Goethe, Johann Wolfgang von (1749–1832), German poet of great gifts and versatility. Born at Frankfurt-on-Maine of a cultivated and well-to-do family, he was able to integrate all the powers with which nature had endowed him in one harmonious personality. Before he went to Weimar at the age of 25 he had written *Götz von Berlichingen* and *Werthers Leiden* and many beautiful lyrics. He settled at Weimar in 1775, received a Ministerial appointment and actively interested himself in the welfare of the state. *Faust*, the great dramatic poem which accompanied him from early manhood to the end, epitomises his whole life and was his crowning achievement. Not only was he a great poet, but scientist and philosopher besides.

Gogol, Nikolai Vasilievich (1809–52), one of the greatest of Russian novelists whose stories of provincial life are in the same setting as his *Dead Souls* (1842), a masterpiece of humour. Another masterpiece is his play *The Government Inspector* (1836), a satire on provincial bureaucracy. An artist of supreme originality.

Goldsmith, Oliver (1728–1774), the celebrated author of *The Vicar of Wakefield*, *The Deserted Village*, and *She Stoops to Conquer*. The son of a poor Irish curate, he found his way to London in 1756, subsequently devoting himself entirely to literature, being befriended by Dr. Johnson and held in great esteem by Reynolds, Burke and other eminent men of the time. He was buried in the churchyard of the Temple.

Goodyear, Charles (1800–1860), an American, discoverer of the art of vulcanising rubber, by which the utility of the material was greatly extended.

Goossens, Sir Eugène (1893–1962), English composer and conductor of Belgian parentage. He was associated with many famous orchestras, and his compositions include the operas *Judith* and *Don Juan de Mañara*. His brother Léon is a celebrated oboe virtuoso, both his sisters are gifted harpists, and his father and grandfather, who also bore the name Eugène, were conductors.

Gordon, Adam Lindsay (1833–1870), an Australian poet who wrote many stirring ballads and poems, his *Bush Ballads and Galloping Rhymes* being a great success.

Gordon, Major-General Charles George, C.B. (1833–1885), a distinguished soldier, administrator, and earnest Christian, who had a most adventurous, useful, and self-sacrificing career. He saw active service in the Crimea, China, and India, and in 1873 was made Governor of the Equatorial provinces of Egypt. In 1877 he went out to the Sudan for the Egyptian Government, and in 1884 again proceeded thither on behalf of the English Government to deal once more with the difficulties which had arisen consequent on the Mahdi's Rebellion. While defending Khartoum he was murdered by the Mahdi's forces on the palace staircase.

Gordon, Lord George (1751–1793), was tried for treason as the instigator of the Anti-Popery riots of 1780, but acquitted on the ground that he had no treasonable intention. Some years later he was committed to Newgate for libelling Marie Antoinette and died there of fever.

Gorky, Maxim (pseudonym of Alexey Maximovich Peshkov) (1868–1936), great Russian writer and playwright. Worked in a variety of trades from the age of ten—shoemaker's apprentice, scullion on a Volga steamboat, birdwatcher, baker, fisherman, railway guard—during which time he learned to write. His early years are described in *My Childhood* (1913). His first story was published in 1892. His works are noted for their vividly drawn characters and social realism.

Gosse, Sir Edmund, C.B., LL.D., Litt D. (1849–1928), a distinguished poet and critic who wrote lives of Gray, Congreve and Dr. Donne, and his *History of 18th Century Literature* and *History of Modern English Literature* show great critical power and appreciation. Was librarian to the House of Lords 1904–14, and wrote a book on French literary men and a life of Sir Thomas Browne In 1907 he published *Father and Son*, being recollections of his father

Gounod, Charles François (1818–93), French composer whose fame rests chiefly on his operas *Faust* and *Roméo et Juliette*, though his lyrical gifts are best shown in some of his earlier works, such as *Le Médicin malgré lui* and *Mireille*.

Gower, John (1325–1408), an English poet of the time of Chaucer, who wrote many elegant ballads and devotional poems. His *Confessio Amantis* was his outstanding work.

Goya y Lucientes, Francisco José (1746–1828), a famous Spanish painter and etcher, and one of the greatest artists of all time, renowned for his wonderful series of etchings and satirical drawings. His portraits can only be described as ruthless in their realism, and his etchings in the *Horrors of War* tell of his hatred of the cruelty and reaction in his own country. In addition to portraits and genre he painted frescoes in the Cathedral at Saragossa. England's first exhibition of his art was held in 1963.

Grace, Dr. William Gilbert (1848–1915), renowned and almost legendary cricketer who by his character and skill dominated English cricket for over forty years, and was probably the best-known man in England. Altogether in first-class cricket he scored 54,896 runs, including 126 centuries, and took 2876 wickets. Scored 1000 runs in May 1895; and three times made over 300 runs in an innings.

Graham, John, of Claverhouse, Viscount Dundee (1643–1689). Renowned for his sturdy adherence to the Stuarts, and headed a rebellion in Scotland against William and Mary, but was killed at the Battle of Killiecrankie.

Grahame, Kenneth (1859–1932), as a writer of books for children ranks almost with Lewis Carroll. *The Golden Age*, *Dream Days*, and *Wind in the Willows*, all achieved great popularity.

Grahame-White, Claudé (1879–1959), aviator and engineer, the first Englishman to gain an aviator's certificate, 1909; won the Gordon Bennett Cup with the then record speed of 60¼ miles per hour in 1910, founded the first British Flying School and published many works on aircraft.

Grainger, Percy Aldridge (1882–1961), pianist and composer, b. in Australia, U.S.A. citizen. He

was a brilliant player and an authority on folk-song, the influence of which is apparent in all his compositions.

Grant, General Ulysses Simpson (1822–1885), the most distinguished American general of the Civil War. President of the United States from 1869 to 1877.

Granville-Barker, Harley, D. Litt., LL.D., F.R.S.L. (1877–1946), distinguished English dramatist, producer, and actor. Introduced plays of Ibsen and Shaw to British public. His own plays reflect influence of Shaw, and are particularly notable for their realistic dialogue.

Grattan, Henry (1746–1820), an Irish orator and statesman who, first in the Irish Parliament and afterwards in the Imperial Parliament, did memorable work for the cause of his country.

Graves, Robert Ranke (b. 1895), English poet and writer. His most famous work, apart from his poems, is *Goodbye to All That*, written after the first great war. Succeeded Auden as Prof. of Poetry at Oxford, 1961–66.

Gray, Thomas (1716–1771), the English poet, whose *Elegy written in a Country Churchyard* is one of the most beautiful in the language. His other poems were not numerous but included a fine *Ode on a Distant Prospect of Eton College* and a notable *Ode to Adversity*.

Greeley, Horace (1811–1872), founder of the *New York Tribune* and a political writer of great power and influence. Was an unsuccessful candidate for the United States Presidency in 1872.

Green John Richard (1837–1883), an eminent English historian. Published a *Short History of the English People* in 1874.

Greenway, Kate (1846–1901), a gifted book illustrator and water-colour artist, whose drawings of children won her great popularity and the warm approval of no less a critic than Ruskin.

Greene, Graham, C.H. (b. 1904), English novelist and journalist whose novels (*The Heart of the Matter*, *Brighton Rock*, *The Quiet American*, *Our Man in Havana*, *A Burnt-out Case*), like his plays (*The Complaisant Lover*), and films (*Fallen Idol*, *The Third Man*), deal with moral problems in a modern setting from a Catholic standpoint.

Gregory, St. (257–336), was founder of the Armenian Church, and spent his last years in a cave at the foot of Mount Sebuh.

Gregory the Great, St. (c. 540–604), Pope 590–604. The last great Latin Father and the forerunner of scholasticism. The real founder of the temporal power and the political influence of the papacy, he also maintained the spiritual claims of Rome, enforcing discipline, encouraging monasticism, defining doctrine, and adding to the music, liturgy, and canons of the Church. Thus he exerted enormous influence on the life and thought of the Middle Ages.

Gregory VII (c. 1020–85), Pope from 1073. Originally called Hildebrand. Battled for papal omnipotence within the Church, stamping on simony and the marriage of priests. His victory in the conflict of empire and papacy came when the emperor, Henry IV, did penance for three days in the snow at Canossa, but had the unfortunate result of leading to further internal dissensions in Germany and to papal absorption with power politics rather than to Gregory's aim of an ideal theocracy embracing all States.

Gregory XIII (1502–85), Pope, 1572–85; introduced the Gregorian calendar.

Gregory, James (1638–1675), Scottish mathematician, invented a reflecting telescope and was the first to show how the distance of the sun could be deduced by observations of the passage of Venus across the disc of the sun. In many successive generations his family reached distinction in the academic world.

Grenville, Sir Richard (1541–1591), the Elizabethan sea-captain, who with his one ship engaged a fleet of Spanish war-vessels off Flores, in 1591, was captured and shortly after died on the Spanish flagship *San Pablo*, an exploit celebrated in Tennyson's noble ballad, *The Revenge*.

Gresham, Sir Thomas (1519–1579), was the wealthiest London merchant and financier of his time. He built the first Royal Exchange and founded Gresham College. The son of Sir Richard Gresham (Lord Mayor of London), he succeeded his father as King's Agent at Antwerp, and proved an astute money-finder for the Court in four successive reigns, ending as Queen Elizabeth's "Royal Merchant."

Greuze, Jean Baptiste (1725–1805), French painter, whose works, especially his studies of girls, display much delicacy and beauty of handling.

Grey, Charles, 2nd Earl, K.G. (1764–1845), a great English Whig statesman under whose Premiership were passed the Reform Bill of 1832, the Bill abolishing slavery throughout the British Empire (1833), and the Poor Law Amendment Act, 1834.

Grey, Lady Jane (1537–1554), was the daughter of the Duke of Suffolk and great-granddaughter of Henry VII. On the death of Edward VI, she was proclaimed Queen, but only reigned for nine days, Queen Mary ousting her and maintaining the Tudor succession. Six months later Lady Jane and her husband, Lord Guildford Dudley, were executed.

Grey of Fallodon, 1st and only Viscount, K.G., P.C. (1862–1933). Under-Secretary for Foreign Affairs, 1892. Foreign Secy., 1905–16. He won high approval for his handling of the Balkan difficulties of 1912–13, and all through the difficult strain which preceded Germany's rush into war acquitted himself with force and dignity. Leader of Liberal Party in House of Lords until Aug. 1924. Chancellor of Oxford Univ., 1928–33.

Grieg, Edvard Hagerup (1843–1907), a Norwegian musical composer, who presented the characteristics of his country's music in numerous compositions of great melodic beauty.

Griffin, His Eminence Cardinal Bernard William (1899–1956), Roman Catholic Archbishop of Westminster from 1944 until his death.

Griffith, Arthur (1872–1922), was the first President of the Irish Free State 1921; founder and first editor of *Sinn Fein* 1906–15. and founder of the *Sinn Fein* movement.

Griffith, David Wark (1880–1948), pioneer American film producer. Noted especially for his remarkable films *Broken Blossoms* and *The Birth of a Nation*. Invented much of the technique of the modern cinema.

Grimm, the brothers Jakob Ludwig Karl (1785–1863) and **Wilhelm Karl** (1786–1859), German philologists and folk-lorists who wrote the world-famous *Fairy Tales*. They planned a gigantic etymological dictionary of the German language, which was completed by German scholars in 1961.

Grimond, Rt. Hon. Joseph (b. 1913), Leader of the Liberal Parliamentary Party 1957–67; Liberal M.P. for Orkney and Shetlands since 1950; Liberal Chief Whip, 1951–57.

Grimthorpe, 1st Baron, LL.D. (1816–1905), long known as **Sir Edmund Beckett**, Bt., K.C., was a great authority on horology, and, with Professor Sir George Airy (*q.v.*), designed "Big Ben." He restored St. Albans Cathedral at his own cost.

Gromyko, Andrei A. (b. 1908), Russian diplomat; Foreign Minister, 1957–. Ambassador to Britain, 1952–3, and to the U.S.A., 1943–46. Representative of the Soviet Union on the U.N. Security Council, 1946–49.

Grossmith, George (1847–1912), the well-known actor and entertainer. His father, George Grossmith the elder, was also a popular entertainer and lecturer, his brother, Weedon Grossmith, was an actor and artist of considerable attainments, and his son, George Grossmith (1874–1935), was a successful comedian, and the first to introduce revue and also cabaret entertainment into England.

Grote, George (1794–1871), English historian famous for his *History of Greece*, 1846–56, an epoch-making and standard work.

Grotius, Huig van Groot (1583–1645), Dutch jurist, the founder of international law. He was condemned to life imprisonment for supporting religious toleration but made a daring escape and found refuge in Paris, where he wrote his masterpiece *De Jure Belli et Pacis*.

Grouchy, Marshal Emmanuel, Marquis de (1766–1847), a famous Napoleonic general who, at Hohenlinden, Wagram, and in the Moscow retreat rendered signal service. After Waterloo he led the defeated army back to Paris.

Grove, Sir George (1820–1900) was a distinguished engineer and bridge and lighthouse builder, but better known as an enthusiastic lover of music, the study and performance of which in England

he did much to promote. His *Dictionary of Music and Musicians* is a standard work.

Guedalla, Philip, M.A. (1889–1944), was an English historian and essayist. Author of *The Partition of Europe* (1914), *The Second Empire* (1922), *Palmerston* (1926), *The Missing Muse* (1929), *The Duke* (1931), and other works.

Guido Reni (1575–1642), Italian painter of the Bolognese school whose works are characteristic of the Italian baroque art of his period and include the famous *Aurora* fresco in the Rospigliosi palace at Rome, and *Crucifixion of St. Peter* (Vatican).

Gustavus Adolphus, King of Sweden (1594–1632), the "Lion of the North," after a lengthy campaign in Poland, entered the Thirty Years' War in support of Swedish interests and Protestant distress, won the Battle of Breitenfeld in 1631, and was killed in action the next year.

Gutenberg, Johann (c. 1400–68), German printer, b. Mainz, the first European to print with movable types cast in moulds. The earliest book printed by Gutenberg was the Mazarin Bible (L76).

Guy, Thomas (1644–1724), founder of Guy's Hospital, was a dealer in Bibles, speculator and money-lender, who after making a large fortune, bequeathed £300,000 for the erection and endowment of the famous hospital.

Gwynne, Nell (1650–1687) English actress; as a girl, orange-seller near Drury Lane Theatre; favourite mistress of Charles II. Her eldest son was made Duke of St. Albans.

H

Haakon VII. (1872–1957), King of Norway. Formerly Prince Carl of Denmark, second son of Frederick VIII.; elected to the throne on the separation of Norway from Sweden in 1905. Married Princess Maud, youngest daughter of King Edward VII. in 1896.

Hadfield, Sir Robert Abbott, Bt., F.R.S. (1858–1940), English metallurgist whose discovery of manganese steel in 1882 brought him recognition from every steel-producing country.

Hadrian (76–138) was Emperor of Rome in succession to his uncle Trajan, and one of the greatest of Roman rulers. He visited Britain, and in A.D. 121 built the wall between Newcastle and Carlisle for protection of his dominions against the Picts and Scots.

Hafiz, pseudonym of Shams ad-Din Mohammed (1320–1389), great Persian lyrical poet. His principal work is the *Divan*, a collection of short sonnets called *ghazals* The sobriquet *Hafiz*, meaning one who remembers, is applied to any one who has learned the Koran by heart.

Hahnemann, Samuel Christian Friedrich (1755–1843), the German physician who founded the system of homoeopathy. Dissatisfied with the state of medicine at the time, he set himself the task of formulating general principles governing the restoration of health. Homoeopathy is based on the principle that diseases should be treated by drugs which when given to a healthy person provoke symptoms similar to that of the disease to be treated. His second principle was that drugs should be given in almost infinitesimal doses.

Haig, Field-Marshal, 1st Earl of Bemersyde, K.T., G.C.B., O.M., G.C.V.O., K.C.I.E. (1861–1928), C.-in-C. of the British Expeditionary Forces in France and Flanders, 1915–19.

Haile Selassie I., G.C.B., G.C.M.G., G.C.V.O. (b. 1891), Emperor of Ethiopia, April 1930 to May 1936, and since May 1941.

Hakluyt, Richard (1553–1616), the fi naval historians. By his *Divers V ing the Discovery of America*, a *Navigations, Voyages, and Discoveries of the English Nation*, did much to help forward the colonising spirit.

Haldane, John Burdon Sanderson (1892–1964), biologist and geneticist, noted not only for his influence in his special field of mathematical evolutionary theory but for the use he made of his great gifts in explaining science to the layman. He held the Chair of Biometry at University College, London, from 1937 until 1956. Emigrated to India in 1957. He was the son of John Scott Haldane (1860–1936) whose researches led to improvements in public health and industrial safety.

Haldane, Viscount, P.C., K.T., O.M., F.R.S. (1856–1928), sat for Haddingtonshire, 1885–1911. In 1901 was Vice-President of the Liberal Imperialist League, and at the close of 1905 was made War Minister and organised the Territorial Force. Lord Chancellor, 1912–15, and again in first Labour Government, 1924.

Halévy, Ludovic (1834–1903), a brilliant French writer who supplied Offenbach with libretti for some of his most famous comic operas: among them *La Belle Hélène*, *La Grande Duchesse*, and *Barbe Bleue*. In conjunction with Meilhac he wrote several notable plays of which *Frou-frou* was perhaps the most successful.

Halifax, Charles Montague, Earl of (1661–1715), seventeenth century financier who was responsible for the National Debt, the window tax, the revaluation of the currency, and the foundation of the Bank of England.

Halifax, 1st Earl of, Edward Frederick Lindley Wood, K.G., P.C., O.M., G.C.S.I., G.C.I.E., T.D. (1881–1959), filled many difficult positions with distinction and success and was especially notable as Viceroy of India, 1926–31, Foreign Secretary, 1938–40, and British Ambassador in Washington, 1940–45. He wrote a life of John Keble and was prominent in the life of the Church of England. Chancellor of Oxford University 1933–59.

Halifax, George Savile, Marquess of (1633–95), author of *Advice to a Daughter* and *Character of a Trimmer*, was a gifted and independent politician, pamphleteerist, and orator.

Hallam, Henry (1777–1859), a graceful and scholarly historian who contributed several important works. His *View of the State of Europe during the Middle Ages*, *Constitutional History of England*, and *Introduction to the Literature of Europe* are distinguished for their clearness of style and correctness of judgment.

Hallé, Sir Charles (1819–1895), a distinguished pianist and conductor who was born in Westphalia. Went to Paris to study music in 1836, and in 1848 settled in London, where he soon became known as a piano-player of the first rank. He organised an orchestra of high-class talent, and for many years conducted it in London and the provinces. He married Madam Norman Neruda (d. 1911), the celebrated violinist in 1888, and was knighted the same year.

Halley, Edmund, F.R.S. (1656–1742), English Astronomer Royal from 1720 to his death and ranked next to Newton among the scientific Englishmen of his time. Made first magnetic survey of the oceans from the naval vessel *Paramour*, 1698–1700. Discovered what is known as Halley's comet.

Hals, Franz (1584–1666), a famous painter of the Dutch School, who is represented in the leading galleries of Europe. The Wallace Collection has his world-famous picture, the *Laughing Cavalier*.

Hamilton, Alexander (1757–1804), American statesman and economist, opponent of Thomas Jefferson, served as Secretary of the Treasury in Washington's cabinet, 1789–95. Though a monarchist by predilection, he urged the adoption of the Constitution, and in conjunction with Maddison and Jay wrote the *Federalist*.

Hamilton, Emma Lyon, Lady (1761–1815), was a woman of humble birth and great personal beauty who attained prominent notice by her association with Sir William Hamilton, British Ambassador at Naples, who married her, and afterwards with Lord Nelson, who conceived an infatuation for her.

Hammarskjöld, Dag Hjalmar Agne Carl (1905–1961), Sec.-Gen. of the United Nations, 1953–61. Killed in air crash on way to the Congo to end dispute between central government in Leopoldville and M. Tshombe of Katanga province. Posthumously awarded 1961 Nobel Peace Prize.

Hammond, John Lawrence Le Breton (1872–1949), English journalist and historian whose works on social and industrial history, written mainly in collaboration with his wife, Barbara Hammond, include *The Village Labourer*, 1911; *The Town Labourer*, 1917; *The Skilled Labourer*, 1919; and *The Age of the Chartists*, 1930.

Hampden, John (1594–1643), English patriot who opposed Charles I.'s "Ship Money" tax, and by his resistance and eloquent advocacy of the wish of the people helped the Parliamentary cause.

Hamsun, Knut, pen-name of Knut Pedersen (1859–1952), Norwegian author and farmer, who in his youth struggled for existence, visited America twice and earned his living by casual labour. His monumental work, *Markens Grøde* (*Growth of the Soil*), gained him the Nobel Prize in 1920.

Handel, George Frederick (1685–1759), German composer, son of a barber-surgeon to the Duke of Saxony; born the same year as Bach. He spent much of his life in England composing operas and achieving world-wide fame by his magnificent series of oratorios. His operas, of which there are over forty, include *Atalanta*, *Berenice*, and *Serse*, and his oratorios, of which there are thirty-two, include *Saul*, *Israel in Egypt*, *Samson*, *Messiah*, *Judas Maccabaeus*, and *Jeptha*. He also composed chamber music, *concerti grossi*, music for chorus and orchestra, solo cantatas, harpsichord suites, and much other beautiful and noble music. Beethoven said of Handel, "Go and learn of him how to achieve great effects with simple means." Eight years before he died he became totally blind and relied upon his old friend and copyist John Christopher Smith to commit his music to paper. He was buried in Westminster Abbey. *See* Section E.

Hannibal (247–183 B.C.), the renowned Carthaginian general, who led an army against Rome, and achieved many notable victories over superior numbers. Was defeated by Scipio at the Battle of Zama, and afterwards suffered exile, and poisoned himself

Harcourt, Rt. Hon. Sir William Vernon, F.R.S. (1827–1904), barrister, author, Liberal statesman, an enthusiastic supporter of Mr. Gladstone.

Hardicanute (1019–1042), son of Canute the Great, was King of England from 1040 to 1042, and imposed the tax called Danegeld. He was the last Danish sovereign of this country.

Hardie, James Keir (1856–1015), a Socialist politician and Labour representative who acted as editor of the *Miner* and the *Labour Leader* from 1887 to 1904. He is regarded as the founder of the Labour Party. During his early life he worked in a Scottish coal pit, but in 1882 became a journalist, and entered Parliament as member for West Ham (South) in 1892–95, being the first Socialist to be elected to the House of Commons. First Chairman of the Parliamentary Labour Party, 1906–8, M.P. for Merthyr Tydvil from 1900 till his death.

Hardy, Thomas, O.M. (1840–1928), was educated as an architect and practised for some time, but became known as a promising novelist in 1871 with his story *Desperate Remedies*. In 1874 his *Far from the Madding Crowd* was published, which at once made him a name. Following that, at short intervals, came a long series of powerful novels from his pen. Perhaps the most notable of his stories are *The Trumpet Major*, *The Mayor of Casterbridge*, *Tess of the D'Urbervilles*, and *Jude the Obscure*. In 1908 he completed a dramatic poem entitled *The Dynasts*, whose central figure is Napoleon.

Hargreaves, James (1720–1778), was a poor Lancashire-born mechanic who invented the spinning jenny, one of the revolutionising labour-saving contrivances of the latter half of the 18th century. It met with much opposition, however, and kept him poor, though the community afterwards reaped the advantage in a greatly improved industry.

Harkness, Edward Stephen, B.A., M.A., LL.D. (1874–1940) was a banker and one of America's greatest philanthropists. Donor of the Pilgrim's Prize of £2,000,000 to Great Britain; founded in 1930 the Pilgrim Trust in appreciation of Great Britain's acceptance of financial burdens in the Great War of 1914–18.

Harley, Robert, 1st Earl of Oxford, K.G., P.C. (1661–1724), a distinguished Tory statesman—originally, however, a Whig—of the Queen Anne period, who fell into disgrace after that Sovereign's death in consequence of being suspected of intriguing with the Stuarts. He served at different times as Speaker of the House of Commons, Chancellor of the Exchequer, and Lord Treasurer. "The Harleian Collection" in the British Museum is a reminder of his cultured literary tastes.

Harold II. (1022–1066), the last of the Saxon Sovereigns of England, and the son of Earl Godwin, was crowned King in succession to Edward the Confessor in 1066. The coming of William the Conqueror, with his great army, soon, however, put an end to the hopes of Harold and his followers; and the Battle of Hastings terminated at once his life and Saxon sway in this country.

Haroun-Al-Raschid (763–809), the famous Caliph of Bagdad, familiar to all by the references to him in the *Arabian Nights*.

Harriman, William Averell (b. 1891), American public official: under-secretary of state for political affairs, 1963; Pres. Kennedy's roving ambassador, 1961; special U.S. representative in Europe for Marshall Aid, 1948–52.

Harris, Joel Chandler (1848–1908), American journalist and author, famous as the creator of "Uncle Remus." The negro humour of his stories brought him world-wide popularity among adults and children alike. His Brer Rabbit in the Uncle Remus negro folk-tales was the forerunner of Mickey Mouse, impudently victorious in every contest against fearful adversaries.

Harrison, Frederic (1831–1923), as leader of the English Positivists, filled a prominent part in philosophical discussions during the last quarter of the 19th century. In 1907 he published *The Creed of a Layman* and *The Philosophy of Common Sense*, and in 1908 *Realities and Ideals*.

Harrison, John (1693–1776), the inventor of the chronometer, for which he received the Government grant of £20,000, was a mechanician of great ingenuity, who effected many important improvements in clocks, watches, and other instruments. In 1715 he made an 8-day clock with wooden wheels, which is still working in the Science Museum, South Kensington.

Harte, Francis Bret (1839–1902), the American poet and author, who leapt into popularity in the late 'sixties by his clever sketches and stories of Californian mining life.

Harty, Sir (Herbert) Hamilton, Mus. Doc. (1880–1941), was a well-known British composer and conductor. Conductor of Hallé Orchestra 1920–33; Musical Adviser and Conductor-in-Chief of London Symphony Orchestra 1932–41.

Harvey, William (1578–1657), an English physician who rose to great eminence both as anatomist and physiologist. He spent five years at Padua where Galileo was a teacher at the University. He immortalised himself by discovering the circulation of the blood in 1616. He was physician to both James I and Charles I.

Hastings, Sir Patrick, Q.C. (1880–1952), lawyer, politician, and playwright. Attorney-General in first Labour Government, 1924. Author of *The Blind Goddess*.

Hastings, Warren (1732–1818), the first Governor-General of India. On his return to England 12 years later he was impeached on charges of excessive cruelty and corruption. The trial lasted seven years, and cost Hastings £76,000. He was ultimately acquitted, and the East India Company settled an annuity of £4,000 upon him, and he lived to see his plans for the security of British rule in the Orient publicly applauded.

Hauptmann, Gerhart (1862–1946), one of the leading dramatic poets of Europe. Born in Silesia, he devoted himself first to agriculture, then to art, and subsequently to the drama, and lived in Rome, Berlin, Switzerland, and the United States. Produced many plays, including *The Weavers*. Winner of the Nobel Prize for Literature, 1912.

Havelock, Major-Gen. Sir Henry, K.C.B. (1795–1857), one of the heroes of the Indian Mutiny, who led the troops to the relief of Cawnpore and Lucknow.

Hawke, Edward, 1st Baron, K.C.B. (1705–1781), one of the great admirals of the 18th century. He won a brilliant victory over the French fleet at Quiberon in 1759 in a tremendous storm.

Hawkins, Sir John (1532–1595), a brilliant naval officer of the Elizabethan period, who did much sea fighting in many climes, and served as vice-admiral in the expedition against the Spanish Armada, for which he was knighted.

Hawthorne, Nathaniel (1804–1864), American novelist, author of *The Scarlet Letter* and *The Blithedale Romance*.

Haydn, Franz Joseph (1732–1809), Austrian composer, who belongs to the great classical period of Bach, Handel, and Mozart and whose style also influenced Beethoven. He has been given the title "father of the symphony." Much of his life was spent as musical director to the princely Hungarian house of Esterhazy. In 1791 and again in 1794 he visited London, where he conducted his Salomon symphonies. He composed many operatic works, string quartets, symphonies (104 in all), sonatas, songs, Masses, and chamber music. His two great oratorios, *The Creation* and *The Seasons*, were written in his old age. *See* **Section E.**

Hazlitt, William (1778–1830), English essayist and critic. His *Characters of Shakespeare's Plays* and his published lectures on the poets and dramatists, besides his *Table Talks*, are still widely read. His son William (1811–1893) was also of literary tastes, though he became Senior Registrar in the Bankruptcy Court; and the son of the latter, William Carew Hazlitt (1834–1913), though originally a civil engineer, acquired celebrity as a bibliographer and numismatist.

Hearst, William Randolph (1863–1951), American newspaper proprietor who established his supremacy in sensational journalism, and built up the biggest newspaper empire in the world.

Heath, Rt. Hon. Edward Richard George, M.P. (b. 1916), Leader of the Conservative Party, 1965–; began his political career in 1950 when he entered Parliament as member for Bexley.

Hedin, Dr. Sven Anders, Hon. K.C.I.E. (1865–1952), a Swedish traveller who made discoveries in Central Asia, and wrote extensively thereon.

Heenan, His Eminence Cardinal John Carmel (b. 1905), Archbishop of Westminster (1963); member of Sacred College (1965).

Hegel, Georg Wilhelm Friedrich (1770–1831), a famous German philosopher and professor who taught that truth or reality has three aspects revealing itself in dialectical development (thesis, antithesis, synthesis) and identified reality with rationalism. Among his important works are *The Phenomenology of the Spirit*, *The Science of Logic*, *Philosophy of Right*. *See also* **Dialectical Materialism, J12.**

Heidenstam, Carl Gustaf Werner von (1859–1940), Swedish author and one of the most brilliant and outstanding figures in Swedish literature. Received Nobel Prize for Literature, 1916.

Heifetez, Jascha (b. 1901), Russian-born violinist who became a naturalised American. He was the first musician to win a reputation in England by gramophone records before his first personal appearance there.

Heine, Heinrich (*c.* 1797–1856), the German lyric poet, who lived for the best part of his life in Paris, and produced from time to time poems of profound beauty and subtlety of thought. Cynical, satirical, and often bitter, many of his writings excited great conflict of opinion.

Helmholtz, Hermann Ludwig Ferdinand von (1821–94), German physiologist, physicist, and mathematician who made many important contributions to the knowledge of thermodynamics, electrodynamics, and optics. His pupil Heinrich Hertz discovered electromagnetic radiation.

Helmont, Jan Baptista van (1577–1644), Belgian chemist who devoted himself to the study of gases. His chief work is *Ortus medicinae* (1648).

Héloïse (c. 1101–64), niece of Canon Fulbert of Notre Dame. Famed for her romantic attachment to Abelard. (*See* **Abelard.**)

Hemingway, Ernest (1899–1961), American author of some celebrated novels: *A Farewell to Arms*, *Death in the Afternoon*, *For Whom the Bell Tolls*, *The Snows of Kilimanjaro*, *The Old Man of the Sea*. He suffered from persecution mania in his last days and committed suicide. Considered one of the most influential writers of his generation. Nobel Prize 1954.

Henderson, Rt. Hon. Arthur (1863–1935), President of World Disarmament Conference, 1932–35; Leader of the Labour Party, 1931–32; Foreign Secretary, 1929–31; Home Secretary, 1924. Awarded the 1934 Nobel Peace Prize.

Henrietta Maria (1609–1669), the daughter of Henry IV. of France and wife of Charles I.

Henry, Joseph (1797–1875), American physicist who invented and operated the first electromagnetic telegraph. The unit of inductance is named after him.

Henry I. (1068–1135), king of England, 1100–35; youngest son of William the Conqueror, ascended the throne during the absence on crusade of his elder brother Robert of Normandy. His long reign brought order and progress, not entirely destroyed by the anarchy under his successor Stephen.

Henry II. (1133–1189), first Angevin king of England, 1154–89, son of Matilda, daughter of Henry I, and her second husband, Geoffrey Plantagenet, count of Anjou; his lands stretched from the Solway Firth to the Pyrenees. He was a strong ruler to whom we owe the establishment of the Common law system (see **D4(1)**) and many permanent administrative reforms. His conflict with the Church brought about the murder of his archbishop Becket, a man of equally resolute character.

Henry III. (1207–1272), king of England, 1216–72; at war with his barons for the greater part of his reign; incurred unpopularity by his patronage of French favourites. Though an inept ruler his reign showed progress in many fields.

Henry IV. (1367–1413), king of England, 1399–1413, son of John of Gaunt, grandson of Edward III; called Henry Bolingbroke, first of the Lancastrian kings. He was a lover of music and poetry.

Henry IV. of France (Henry of Navarre) (1553–1610), prior to becoming king was the leader of the French Huguenots, and although going over to the Catholics on being crowned, remained in sympathy with the Protestants and protected them by the famous Edict of Nantes. Ravaillac, a religious fanatic, assassinated Henry.

Henry V. (1387–1422), king of England, 1413–22, succeeded his father Henry IV; distinguished himself in the wars with France, his victory at Agincourt (25 Oct. 1415) being his greatest triumph. Though masterful and hard, he was devout and just and made an able and energetic monarch.

Henry VI. (1421–1471), king of England, 1422–61, only son of Henry V., by nature gentle and retiring. Succeeding to the throne under a protectorship as a baby nine months old, he had a troubled reign, including a long war with France and loss of French possessions, the Jack Cade insurrection, and the beginning of the Wars of the Roses, which led to his deposition and the enthronement of Edward IV by the triumphant Yorkists. He was imprisoned in the Tower and there probably murdered. Founded Eton College (1440) and King's College, Cambridge (1441).

Henry VII. (1457–1509), the first of the Tudor line, reigned 1485–1509; succeeded Richard III, after defeating and killing him on Bosworth Field. Conspiracies and rebellions marked his reign, but he reasserted the power of the state over feudal indiscipline.

Henry VIII. (1491–1547), king of England, 1509–47, ascended the throne at the age of 18, a prince of the Renaissance, handsome, skilled in music and sports, with a love of the sea and a deep interest in theology. His marriages, the judicial murders, his quarrel with Rome and the rejection of papal supremacy, the suppression of the monasteries, the rise and fall of Wolsey, the last of England's great ecclesiastical statesmen, made his reign one of the most crucial in history. He built the royal dockyards at Woolwich and Deptford, founded Trinity House, and was the first English monarch to have a navy.

Henry "the Navigator" (1395–1460), a Portuguese Prince, son of John I. He discovered Madeira and the Azores, and was the chief instrument of the national impetus for navigation.

Henschel, Sir George, Mus.D. (1850–1934), English baritone singer, composer and conductor; born in Breslau, he became a naturalised Englishman in 1890. Founder and part conductor of London Symphony Concerts, 1886.

Hepplewhite, George (d. 1786). One of the four great English 18th-century cabinet-makers. He was a contemporary of Chippendale, Robert Adam and Sheraton. His name is identified with the style of furniture which followed the Chippendale period.

Heraclitus of Ephesus (*c.* 540–475 B.C.), a Greek philosopher. His discovery of a *changing* world (he lived in an age of social revolution when the ancient Greek tribal aristocracy was

beginning to [illegible] way to democracy) influenced the pl[illegible] of Parmenides, Democritus, Plato, [illegible]

Herbert, George (1593–1633), the most purely devotional of English poets.

Hereward the Wake, the last of the Saxon nobles to hold out against the Normans. Taking refuge in the Fen country, he long defied the Conqueror's forces, but was at last betrayed into the enemy's hands by monks. William afterwards honoured him with a place at Court.

Herod the Great (c. 73–4 B.C.), the tyrannical king of Judæa who secured the title from Marc Antony in 37 B.C. This was the Herod who was ruling when Christ was born and who ordered the massacre of the Innocents.

Herodotus (c. 485–425 B.C.), the great Greek historian, called by Cicero the father of history Has also been called the father of anthropology.

Herrick, Robert (1591–1674), an English lyric poet, unrivalled in his own field. Author of *Gather ye Rose Buds*, *Cherry Ripe*, *Oberon's Feast*, etc.

Herriot, Édouard (1872–1957), French statesman; Pres. of the National Assembly, 1947–54. Mayor of Lyons for more than a generation, three times Prime Minister, the recognised spokesman of the Left-Centre party, which was for so long dominant in French politics.

Herschel, Sir John Frederick William, Bt., F.R.S. (1792–1871), a celebrated astronomer who did much to extend the power of the telescope.

Herschel, Sir William, F.R.S. (1738–1822), great astronomer, father of the last-named, discovered the planet Uranus. His sister, Caroline Lucretia (1750–1848), was the author of *Index to Flamsteed's Observations of the Fixed Stars* and *Errata*.

Hertz, Heinrich (1857–1894), German physicist whose laboratory experiments confirmed Maxwell's electromagnetic theory of waves and yielded useful information about their behaviour.

Herzl, Theodor (1860–1904), founded modern political Zionism.

Hesiod (*floruit* c. 735 B.C.), ancient Greek nature poet, author of the poems *Work and Days*, which tells of life in the country.

Hill, Octavia (1838–1912), a noted pioneer English social reformer who took a practical interest in the housing conditions of the poor, and a pioneer in slum clearance in London. Helped to institute the Charity Organisation Society, and was one of the first women to sit on a Royal Commission.

Hill, Sir Rowland, K.C.B., F.R.S. (1795–1879), the first propounder of the idea of the penny postal system, was secretary to the Postmaster-General from 1846 to 1854, after which he was Chief Secretary to the Post Office until 1864.

Hindemith, Paul (1895–1963), German composer and violinist. Much of his work is *Gebrauchsmusik* (workaday music written with the aim of establishing closer contact between composer and public). His works are numerous and strikingly varied, and include sonatas and chamber works, songs, operas, ballet music, symphonies, and the oratorio *Das Unaufhörliche*.

Hindenburg, Field-Marshal Paul von (1847–1934). President of the German Reich, 1925–34; Chief of the General Staff, 1916–18.

Hinshelwood, Sir Cyril Norman, O.M., F.R.S. (b. 1897), Pres. of the Royal Society and Dr. Lee's Prof. of Chemistry, Univ. of Oxford, 1937–. Shared with Prof. Semenov of Russia the 1956 Nobel Prize for Chemistry for researches into the mechanism of chemical reactions.

Hinton, Christopher, Baron, K.B.E., M.A., D.Eng., D.Sc(Eng.), F.R.S. (b. 1901), as Man. Dir. of the Industrial Group of the U.K. Atomic Energy Authority played important part in the building of Calder Hall. Chairman (1957–64) Central Electricity Generating Board (which owns and operates Britain's nuclear power stations). Chanc. Univ. of Bath.

Hippocrates of Chios (fl. c. 430 B.C.), a Greek business-man who specialised in mathematics and was the first to compile a work on the elements of geometry.

Hippocrates of Cos (c. 460–c. 370 B.C.), Greek physician, the father of medicine, b. on the island of Cos off the coast of Asia Minor. He established medical schools in Athens and elsewhere and separated medicine from superstition and so placed it on a scientific basis.

Hirohito, Emperor of Japan (b. 1901), acceded to the throne Dec. 1926.

Hitler, Adolf (1889–1945), German dictator, founder of National Socialism, b. in Austria, son of customs official. Worked in Vienna as artisan; already held anti-semitic views. Came to Munich in 1912; enlisted in Bavarian Infantry at outbreak of first world war. At the end of the war conditions in Germany favoured the growth of a fascist movement and under his leadership the National Socialist (Nazi) Party climbed to power. Appointed Reich Chancellor, 1933. On death of Hindenburg in 1934 became Führer. Commander-in-Chief Wehrmacht, 1935. Under the Hitler regime working class movements were ruthlessly destroyed; all opponents—communists, socialists, Jews—were persecuted and murdered. By terrorism and propaganda the German state was welded into a powerful machine for aggression. There followed the occupation of the Rhineland (1936), the annexation of Austria and Czechoslovakia (1938–39), the invasion of Poland and declaration of war by Great Britain and France (1939), the invasion of Soviet Russia (1941). Final defeat came in 1945 and on April 30 Hitler committed suicide in the Chancellery as the Russians closed in on Berlin.

Hobbes, Thomas (1588–1679), English philosopher who published his most famous work, *Leviathan*, in 1651. He favoured strong Government and therefore supported the supremacy of the State even in religion, but his arguments aroused great antagonism even among the Royalists. He was a child of his age in his enthusiasm for scientific enquiry, and his works provoked fresh thought.

Hobbs, Sir John Berry ("Jack") (1882–1963), first played for Surrey 1905; retired from first-class cricket Feb. 1935. Scored 61,221 runs including 197 centuries.

Hobhouse, Leonard Trelawney (1864–1929), English sociologist; Prof. of Sociology, London Univ., 1907–29; editor of the *Sociological Review*, 1908–10, and writer for the *Manchester Guardian*, 1897–1902. His books include *The Theory of Knowledge*, *Morals in Evolution*, and *Development and Purpose*.

Ho Chi-minh (b. 1892), leader of the Vietnam revolutionary nationalist party of Indo-China. Successfully led the struggle for independence during and after the second world war. President of North Vietnam.

Hodgkin, Dorothy Crowfoot, O.M., Hon. D.Sc. (b. 1910), Wolfson Research Professor of the Royal Society at Oxford since 1960; the third woman to receive the Nobel Prize for Chemistry, awarded in 1964 for her X-ray analysis to elucidate the structure of complex molecules, notably penicillin and vitamin B-12.

Hogarth, William (1697–1764), the celebrated engraver and painter who satirised the follies of his time in a series of engravings instinct with character, humour and power. His *Harlot's Progress*, of six engravings, was published in 1734, and gained him immediate fame. In 1735 he produced his equally celebrated *Rake's Progress*, a series of eight engravings. These were followed by *Marriage à la Mode*, *Industry and Idleness*, and *The March to Finchley*.

Hogben, Lancelot, M.A., D.Sc., F.R.S. (b. 1895), physiologist; Prof. Medical Statistics, 1947–61, Prof. of Zoology, 1941–47, Birmingham Univ.; Prof. Natural History, Univ. of Aberdeen, 1937–41; Prof. Social Biology in London Univ., 1930–37. Author of the great popular works *Mathematics for the Million*, *Science for the Citizen*, and *Mathematics in the Making*.

Hogg, Quintin (1845–1903), was an educationist and philanthropist who, purchasing the old Polytechnic Institution in 1882, turned it into a popular college, providing instruction in every department of education at moderate rates.

Hokusai, Katsushika (1760–1849), Japanese artist of the Ukiyo-e (popular school), whose work is highly original and of singular beauty and delicacy. He excelled in landscapes.

Holbein, The Elder (c. 1460–1524), a famous German painter, father of Hans Holbein.

Holbein, Hans—The Younger (1497–1543), was born at Augsburg, and settled in London in 1530, where he won the favour of Henry VIII.

Holden, Charles, F.R.I.B.A. (1875–1960), British architect, designer of modern public buildings, including British Medical Assn. Building, Strand, London Underground Railway Head

Offices, Piccadilly Circus, University of London buildings (Senate House), Bloomsbury.

Holden, Sir Isaac, Bt. (1807–1897), an inventor and manufacturer who achieved fame and fortune in connection with wool-combing inventions.

Hölderlin, Johann Christian Friedrich (1770–1843), friend of Hegel and contemporary of Goethe and Schiller, now considered among the very greatest of German poets. His mind became unhinged in his middle years.

Holford, William Graham, Baron, M.A., F.R.I.B.A. (b. 1907), British architect and town-planner. Prof. of Civic Design, Univ. of Liverpool, 1936–47; Prof. of Town Planning, London Univ., 1949–; planned post-war redevelopment of City of London, including precincts of St. Paul's Cathedral; architect of proposed Piccadilly Circus rebuilding scheme; Member Transport Advisory Council, 1965–.

Holmes, Oliver Wendell (1809–1894), an American doctor and author of great humour and geniality. His writings include *Autocrat of the Breakfast Table*, *The Professor at the Breakfast Table* and *The Poet at the Breakfast Table*.

Holst, Gustav Theodore (1874–1934), a British composer of Swedish descent whose compositions include *The Planets* suite, *The Hymn of Jesus*, an opera *The Perfect Fool*, and a choral symphony. His long career as a teacher of outstanding gifts included the appointment of musical director at St. Paul's Girls' School, London (1905–34) and at Morley College (1907–24). *See* Section E.

Holt, Rt. Hon. Harold Edward (1908–1967), Australian politician; succeeded Sir Robert Menzies as Prime Minister and leader of the Liberal Party in January 1966. Drowned in swimming accident.

Holyoake, George Jacob (1817–1906), an eminent secularist lecturer and author, who was identified with many popular movements, especially Co-operation, of which he was the historian.

Holyoake, Rt. Hon. Keith Jacka (b. 1904), New Zealand politician and farmer; Prime Minister since 1957.

Homer (*c.* 700 B.C.), the most famous of all epic poets. Is supposed to have been a Greek who lived probably at Chios or Smyrna, and has generally been regarded as the author of the *Iliad* and the *Odyssey*, though tradition rather than ascertained fact connects his name with those great poems. *See* H3.

Hood, Samuel, 1st Viscount Hood of Whitley, G.C.B. (1724–1816), a successful British admiral, who in 1793 was in command of the Mediterranean fleet, and showed great capacity in that post, taking and occupying Toulon, and capturing Corsica among other exploits.

Hood, Thomas (1799–1845), an English poet, who, as a prolific writer of serious as well as humorous poems, stands in his own line unique. Of his serious verse, *The Song of the Shirt*, *The Dream of Eugene Aram* and *The Bridge of Sighs* may be cited as the best examples, while his comic poems, notably those of the punning order, are unequalled.

Hooke, Robert (1635–1703), English physicist, a great experimenter and inventor. He was also an architect and drew up a plan for rebuilding London after the Great Fire.

Hooker, Richard (1554–1600), Master of the Temple from 1585–91, and afterwards Rector of Boscome. Famed for his book on *Ecclesiastical Polity*, and for his exquisite choice of words, was known as "Judicious Hooker."

Hopkins, Sir Frederick Gowland, O.M., F.R.S. (1861–1947), an eminent English bio-chemist, noted for his important work on proteins and vitamins. In 1929 was awarded the Nobel Prize in Medicine for his discovery of Vitamin D. Pres. of the Royal Society 1931–36, and of the British Association, 1933.

Hopkins, Harry (1890–1946), Franklin Roosevelt's personal assistant. Particularly assisted the President at the important war-time foreign conferences, as his personal representative abroad, in working out the New Deal, and in the administration of Lend-Lease.

Hopkinson, John, D.Sc., F.R.S. (1849–98), English engineer and physicist. Senior Wrangler and Fellow at Cambridge. Studied engineering in his father's works, and set up as a consultative engineer. Specialised in electrical work, and by developing the theory of alternating current and of the magnetic current in dynamos he paved the way to the common use of electricity in daily life. Was Professor of Electrical Engineering at King's College, London, 1890–98.

Hoppner, John, R.A. (1758–1810), English portrait painter born in Whitechapel of German parents; studied at the Academy Schools, winning great distinction and painted portraits of many members of the Royal Family.

Horace, or more properly **Flaccus Quintus Horatius** (65–8 B.C.), the famous Roman satirist and poet, who was the friend of Virgil, and attained immortal fame by his *Satires*, *Epodes*, and *Odes*.

Horniman, Annie Elizabeth Fredericka, C.H. (1830–1937). English theatre manager and founder of the repertory system in England. She was the daughter of F. J. Horniman, the traveller and collector, who founded the Horniman Museum in Forest Hill and presented it to the L.C.C. in 1901.

Houdini, Harry (1874–1926), American magician, son of a Hungarian rabbi, world-famed for his escapes from handcuffs, locked chambers, sealed cases under water, etc. His real name was Erich Weiss, and he took his stage name from the French conjuror Houdin. He was a keen student of psychic phenomena and exposed fraudulent mediums

Housman, Laurence (1865–1959), English playwright, poet, and novelist, younger brother of **Alfred Edward** (1859–1936) also a poet of distinction, a professor of Latin at Cambridge and an eminent classical scholar, author of *A Shropshire Lad*.

Howard, John (1726–1790), earned celebrity for his philanthropic efforts on behalf of prison reform, the pursuit of which eventually exposed him to a fatal fever attack in Russia.

Howard of Effingham, Lord (1536–1624), commander of the fleet which defeated the Spanish Armada, 1588, and took part in the capture of Cadiz, 1596.

Howe, Elias (1819–1867), an ingenious American who was the inventor of the first sewing machine, by which he made a great fortune.

Howe, Julia Ward (1819–1910), American philanthropist and poetess, famous as the authoress of the *Battle Hymn of the Republic* (1861), a leader of the American Suffragette movement, and the first woman to be elected to the American Academy of Arts and Letters.

Howe, Richard, 1st (and last) Earl (of first creation), **K.G.** (1726–1799), the British admiral who in 1758 destroyed Cherbourg and in 1794 won the famous victory over the French off Brest.

Howells, William Dean (1837–1920), American critic and novelist.

Hubble, Edwin Powell, B.Sc., Ph.D. (1889–1953), U.S. astronomer at Mount Wilson Observatory from 1919 until his death. Noted for his work on extragalactic nebulæ and with the aid of the 200-in. telescope at Mount Palomar made important discoveries.

Hudson, Henry (*c.* 1550–1611), was a famous English navigator who discovered the Hudson River, Hudson Strait and Bay, and his two books describing his voyages are of the greatest interest.

Hudson, William Henry (1841–1922), English author and naturalist, who spent his early years in South America, memories of which influenced much of his work. His books include *The Purple Land* (1885), *Green Mansions* (1904), *Afoot in England* (1909) and *British Birds* (1895). The Hyde Park Bird Sanctuary (opened in 1925) was established in his memory, and contains the famous figure of *Rima* by Epstein.

Huggins, Sir William, O.M., K.C.B., F.R.S. (1824–1910), British astronomer who pioneered in spectroscopic photography. Collaborated with his wife, **Margaret Lindsay Murray** (1848–1915), who was also an able astronomer.

Hughes, Thomas (1822–1896), educated at Rugby and at Oxford; practised at the Bar, and became a County Court Judge in 1882. His best-known work is *Tom Brown's Schooldays*.

Hugo, Victor Marie (1802–1885), the great poet, dramatist and novelist who headed the Romantic movement in France in the early part of the 19th century. He was a man of abounding energy and creative ability. His dramas include *Hernani*, *Ruy Blas*, and *Le Roi s'amuse*. Of his novels, *Notre Dame* belongs to his early

period, *Les Misérables*, to his later life, written while he was living in exile in Guernsey. Less well known is his astonishing skill as a graphic artist, evident even in his boyhood.

Hull, Field Marshal Sir Richard Amyatt, K.C.B., D.S.O., B.A. (b. 1907), British Army cavalry officer, succeeded Sir Francis Festing as C.I.G.S. in 1961, and Lord Mountbatten as Chief of the Defence Staff in 1965.

Humboldt, Baron Friedrich Heinrich Alexander von (1769–1859), German naturalist and explorer whose researches are recorded in his two great books *Voyage de Humboldt et Bonpland* (23 vols., 1805–34) and *Cosmos* (5 vols., 1845–62).

Hume, David (1711–1776), the celebrated historian and philosopher whose *History of England* long held chief place in English historical literature. But Hume's enduring fame rests upon his philosophical writings. He developed the empiricism of Locke into the scepticism inherent in it. His main works are *Treatise of Human Nature* and *Dialogues Concerning Natural Religion*.

Hunt, Brig. (Henry Cecil) John, Baron, C.B.E., D.S.O. (b. 1910), leader of the successful 1953 British Everest Expedition, and director of the Duke of Edinburgh's Award Scheme for Youth. Life peerage conferred, 1966.

Hunt, (James Henry) Leigh (1784–1859), an English poet, politician and essayist. In 1813 he was fined £500, and sentenced to two years' imprisonment for libelling the Prince Regent, and while in prison wrote his poem, *The Story of Rimini*, and other works. In later life he was a constant contributor to literature and from 1847 enjoyed a pension of £200 a year from the Civil List.

Hunt, Wm. Holman, O.M. (1827–1910), one of the three founders of the Pre-Raphaelite movement, and an artist who achieved distinction by several remarkable paintings, the chief of which is, perhaps, *The Light of the World*, an allegorical work.

Hunter, the brothers William, F.R.S. (1718–83) **and John**, F.R.S. (1728–93), were both famous Scottish physicians. William had remarkable success as a lecturer and obstetrician. His valuable anatomical collection was bequeathed to the Univ. of Glasgow. John showed real genius for anatomy, became one of the greatest surgeons of his day and made many discoveries. His surgical museum forms part of the Museum of the Royal College of Surgeons.

Huss, or Hus, John (1369–1415), the Bohemian religious reformer, was strongly influenced by Wyclif and himself urged reform both of abuses in the church and of doctrine. Sentenced to death or recantation he suffered martyrdom on July 6, 1415. His death caused a civil war which lasted for many years.

Hussein ibn Talal (b. 1934), grandson of King Abdullah, succeeded his father Talal as King of Jordan, Aug. 11, 1952.

Hutton, James, M.D. (1726–97), an Edinburgh doctor whose geological researches established the fundamental principles of modern geology. Before his time geology did not exist as a science, all was speculation. He drew his evidence from the rocks themselves, and his *Theory of the Earth* is one of the great classics of science.

Huxley, Aldous (Leonard), C.L. (1894–1963), noted modern writer, grandson of T. H. Huxley and brother of Julian; author of *Crome Yellow*, *Jesting Pilate*, *Brave New World*, *Point Counter Point*, *Ends and Means*, *Grey Eminence*, *The Perennial Philosophy*, etc. *See also* **M5**.

Huxley, Sir Julian Sorrell, M.A., F.R.S. (b. 1887), biologist and writer, grandson of T. H. Huxley. Director-General of Unesco, 1946–48. Secy. of Zoological Soc. of London 1935–42.

Huxley, Thomas Henry, F.R.S. (1825–1895), an eminent scientist and author of numerous works covering a great range of research. After the publication of Darwin's *Origin of Species*, Huxley became an ardent evolutionist. His biological work, *Man's Place in Nature*, and his numerous essays were marked by great vigour and clearness of thought, and gave him a leading position. He held numerous important appointments was President of the Royal Society in 1883, and belonged to many learned societies.

Huygens, Christiaan (1629–1695), Dutch mathematician, physicist, and astronomer, son of the poet Constantijn Huygens (1596–1687): discovered the rings of Saturn, invented the pendulum clock, and developed the wave theory of light in opposition to the corpuscular theory of Newton.

Hyde, Dr. Douglas (1860–1949), the distinguished Irish scholar, historian, poet and folk-lorist. President of Eire, 1938–45.

Hypatia of Alexandria, the only woman mathematician of antiquity. She excited the enmity of Christian fanatics, who raised an agitation against her, and she was put to death in A.D. 415.

I

Ibáñez, Vicente Blasco. (*See* **Blasco-Ibáñez.**)

Ibrahim Pasha (1789–1848), an able Egyptian statesman, general, and Viceroy, who, adopted by Mohammed Ali as his son, contributed largely to the success of Egyptian policy during the quarter of a century or more of his influence. His conquest of Syria was a notable feat of generalship. He died a few months after being appointed Viceroy.

Ibsen, Henrik Johan (1828–1906), the Norwegian playwright and poet, moralist, and humanist, whose plays, though arousing considerable opposition at the time, are acknowledged as the work of one of the world's greatest dramatists. A master of technique, charging every detail with significance, fusing the comic with the tragic, Ibsen revolutionised the European theatre. His chief works are *Ghosts*, *The Master Builder*, *The Wild Duck*, *A Doll's House*, *Hedda Gabler* and the poetic drama *Peer Gynt*.

Inge, Very Rev. William Ralph, K.C.V.O., D.D. (1860–1954), English divine; Dean of St. Paul's, 1911–34; Assistant Master at Eton, 1884–88; Lady Margaret Prof. Camb., 1907–11. Earned the sobriquet "the gloomy Dean" for his incisive and somewhat pessimistic comments on contemporary affairs.

Ingersoll, Robert Green (1833–99), American lawyer, writer, and lecturer, became known by reason of his lectures directed principally against Christianity.

Ingres, Jean Auguste Dominique (1780–1867), a great French historical painter who was elected to the Institute in 1824, and at his death was a Senator of France.

Innocent III. (1160–1216), Pope from 1198, successfully asserted the power of the papacy over such secular princes as the emperor, Philip II. of France, and John of England. He promoted the 4th Crusade, initiated the crusade against the Albigensian heretics, and held the 4th Lateran Council. His pontificate marks the zenith of the medieval papacy.

Inönü, General Ismet (b. 1884), Prime Min. of Turkey; leader of the Republican People's Party founded by Kemal Atatürk whom he succeeded as Pres., 1938–50, after serving as Prime Min. from 1923 to Atatürk's death in 1938.

Iqbal, Dr. Sir Muhammad (1875–1938), poet-philosopher of the East, b. Sialkot, W. Pakistan, acknowledged as a great authority in the world of literature, both in prose and poetry. He wrote in Urdu, Persian, and English.

Ireland, John (1879–1962), English composer, best known for his settings of the poems of Thomas Hardy, A. E. Housman, and Masefield's *Sea Fever*. He also wrote chamber music, orchestral work and piano pieces.

Irving, Sir Henry (1838–1905), a great English actor who made his first appearance in London in 1866 and whose first distinct success was as Digby Grant in *Two Roses*. His record at the Lyceum Theatre from 1871 onwards covered a brilliant series of productions, including *The Bells*, his first triumph, *Charles I.*, *Eugene Aram*, and a number of Shakespearean impersonations, in some of which, notably Shylock and Hamlet, Irving gave memorable performances.

Irving, Washington (1783–1859), a writer of charming stories and miscellaneous works which won wide favour on both sides of the Atlantic.

Isabella of Castile (1451–1504), reigned jointly with Ferdinand V., her husband. During their thirty years' sway Spain was united as a single monarchy, and achieved the height of its greatness, the discovery of America, the conquest of Granada, and the expulsion of the Moors from Spain being among the events of her reign.

Ismail Pasha (1830–95), grandson of Mohammed

Ali was a man of modern ideas and great public spirit, whose policy rendered Egypt practically independent of Turkey, the Sultan confirming him in the position and title of Khedive in 1873. It was his adoption of the idea of the Suez Canal that enabled that work to be successfully carried out. By reckless extravagance he involved himself in difficulties, entailing the sale of his Suez Canal shares to England, the establishment of the dual control of England and France, and his own abdication in 1879, when his son Tewfik succeeded.

Israels, Joseph (1824–1911), outstanding Dutch genre painter of the 19th century.

Ito, Hirobumi, Prince (1841–1909), one of the most enlightened statesmen of Japan. The unparalleled social metamorphosis which Japan underwent in the latter half of the nineteenth century owed much to his guidance and influence. Was four times Premier.

Ivan the Great (1440–1505), succeeded in bringing the scattered provinces of Muscovy under one supreme governmental control, and put an end to Tartar rule.

Ivan the Terrible (1530–84), crowned as first Czar of Russia in 1547, was a strong and autocratic ruler. He furthered internal consolidation and Russian eastward expansion and entered into trading relations with Queen Elizabeth.

Jacks, Lawrence Pearsall (1860–1955), Principal of Manchester College, Oxford, 1915–31, and Professor of Philosophy in that College, 1903–31. Entered ministry in 1887 as assistant to the Rev. Stopford Brooke. Editor of the *Hibbert Journal*, 1902–47, and author of several books of religious studies.

Jackson, Andrew (1767–1845), American general who was twice President of the United States.

Jackson, Thomas Jonathan (1824–1863), popularly known as "Stonewall Jackson," was the most brilliant general on the Southern side in the American Civil War. Was accidentally killed at the Battle of Chancellorsville. The term "Stonewall" refers to his dogged resistance at the first Battle of Bull Run.

Jacobs, William Wymark (1863–1943), novelist of quaint and peculiar humour, whose stories and sketches of East End riverside life are inimitable.

Jacquard, Joseph Marie (1752–1834), a French mechanic whose Jacquard loom provided a new and effective method of weaving designs in textile fabrics, and was an invention of the very first rank.

Jagellons, Lithuanian-Polish dynasty, ruled in Poland 1386–1572.

James I. (1566–1625), King of England (1603–25) and, as James VI., King of Scotland (1567–1625). He was the son of Mary Stuart and succeeded to the English throne on the death of Elizabeth. Numerous plots were formed against him, including the Gunpowder Plot of 1605. He persecuted the Puritans, granted many monopolies, and saw the Authorised Version of the Bible published. Described by Henry IV of France as "the wisest fool in Christendom."

James II. (1633–1701) King of England and, as James VII., of Scotland (1685–88), younger son of Charles I. As Duke of York he was Lord High Admiral in the Second and Third Dutch Wars, during which New Amsterdam fell to England and was renamed New York. As a Roman Catholic he resigned his office after the Test Act of 1673, was nearly excluded from the Succession, and, when he came to the throne in 1685, aroused and united strong opposition by his attempts to obtain better conditions for his co-religionists. The unsuccessful Monmouth Rebellion, the Bloody Assize, the Declaration of Indulgence, and the Seven Bishops' Trial marked a reign which ended in the flight of the King and the Revolution Settlement of 1689.

James, Henry, O.M. (1843–1916), an Anglo-American novelist and younger brother of William James. He wrote over 100 tales and short stories (many of them foremost examples of their kind) and was one of the most sensitive critics of his day. For the last thirty years of his life he resided mostly in London. His best-known novels are *The Europeans* (1878), *Daisy Miller* (1878), *The Portrait of a Lady* (1881), *The Bostonians* (1886), *What Maisie Knew* (1897), and *The Wings of the Dove* (1902). Became a British subject 1915.

James, William (1842–1910), the great American psychologist and philosopher, brother of Henry James, the novelist. He became Prof. of Philosophy at Harvard University, 1882, and was the founder of the philosophical system known as pragmatism. His first important work, *Principles of Psychology*, 1890, stamped him as one of the most lucid, penetrating and engaging writers of his day.

Janáček, Leoš (1854–1928), Czech composer, conductor, teacher, and student of folk music, b. in Moravia, son of a village schoolmaster, creator of a national style. He wrote much choral, orchestral, and instrumental music and his best known opera is *Jenufa*. *See* Section E.

Jeans, Sir James Hopwood, O.M., F.R.S. (1877–1946), mathematician and astronomer, author of *The Universe Around Us*, *The Mysterious Universe*.

Jefferies, Richard (1848–1887), an English naturalist, who, between 1873 and the time of his death, wrote some of the most beautiful descriptions of natural scenery and the customs and habits of the rural world that we possess. His *Gamekeeper at Home* and *The Life of the Fields* are books of great power and sympathy.

Jefferson, President Thomas (1743–1826), took part in the American Revolution, and drew up the Declaration of Independence. Twice U.S. Pres.

Jeffreys, George, 1st Baron of Wem (1645–1689), Lord Chief Justice of Charles II and Lord Chancellor of James II, won for himself unenviable notoriety by his harsh and cruel judgments at the Bloody Assize. He died in the Tower shortly after the flight of James II. It is now thought that the traditional view of Jeffreys is probably untrue as local records give a rather different picture of an able and conscientious judge.

Jellicoe, Adml. of the Fleet, Earl, G.C.B., O.M., G.C.V.O. (1859–1935), Commander-in-Chief of British Fleet, August 1914 to Nov. 1916; and First Sea Lord, Nov. 1916 to Dec. 1917; Gov.-Gen. of New Zealand, 1920–24.

Jenghiz Khan (1162–1227), the famous Mogul ruler who twice conquered China, and forced the Turks within European confines.

Jenner, Edward, M.D., F.R.S. (1749–1823), an English physician who became celebrated by his discovery of the vaccination system of alleviating smallpox, which has been of such incalculable benefit to mankind. Parliament made him grants amounting to £30,000 which left him still out of pocket.

Jerome, Jerome Klapka (1859–1927), a clever journalist and writer, who made his first success with his humorous book, *Three Men in a Boat*. He founded *The Idler*.

Jerome, St. (340–420), a noted theologian of the 5th century, whose Latin translation of the Scriptures (*The Vulgate*) made him famous. He died at Bethlehem.

Jesus Christ (c. 6 B.C.–c. A.D. 29), the founder of Christianity and the greatest figure of human history. The main source of information on His life and work is the New Testament. Jesus was born at Bethlehem in Judæa, and was the first-born of His mother Mary. According to Matthew, He was miraculously conceived and Joseph was His foster-father. The family home was at Nazareth in Galilee. Jesus lived at a critical period in Jewish history. His teaching is summarised in the Sermon on the Mount. So far as scholars can tell Jesus was born some six years earlier than the date which Christian tradition has chosen to fix the first year of its era.

Jiménez, Juan Ramón (b. 1881), Spanish lyric poet who was awarded the Nobel Prize for Literature in 1956.

Jinnah, Mohammed Ali (1876–1948), Indian statesman. The emergence of a separate Moslem state of Pakistan when the British left India was mainly due to his efforts. He was for many years the active President of the Moslem League, and in 1947 became the first Gov.-Gen. of Pakistan.

Joachim, Joseph (1831–1907), Hungarian violinist and composer of the classical-romantic school of

Mendelssohn, Schumann, and Brahms. He ranks as the greatest solo violinist the world has ever known.

Joan of Arc, St. (1412–1431), the girl whose heroism inspired the French to drive the English out of Orleans, and enabled Charles to be proclaimed King at Rheims. She was burned as a heretic at Rouen. Canonised at St. Peter's, Rome, 1920.

Joffre, Marshal Joseph Jacques Césaire, G.C.B., Hon. O.M. (1852–1931), Commander-in-Chief of the French Armies 1911–16. With Gen. Gallieni deserves credit for the French counter-attack at the Battle of the Marne. Entered the Army in 1870, and commanded a battery during the siege of Paris.

John XXIII. (1881–1963), elected Pope in 1958 on the death of Pius XII; formerly Cardinal Angelo Giuseppe Roncalli, patriarch of Venice. The Ecumenical Council which opened in Rome in 1962 was one of the great achievements of his short reign. He sought to reform the Church to meet the needs and conditions of the times and set in train movements towards Christian unity. The principal sources of his teaching are the two enlightened encyclicals, *Mater et Magistra* (1961) and *Pacem in Terris* (1963).

John, St., the Baptist (executed A.D. 28), the forerunner of Christ.

John, St., the Evangelist, one of the twelve apostles of Jesus, a Galilean fisherman, son of Zebedee and brother of James, traditionally the author of the fourth Gospel.

John, surnamed "Lackland" (1167–1216), King of England from 1199 to his death at Newark after deposition by the Barons in 1216. One of the most detested of English monarchs, but whose reign stands out large in history because of his having granted, under compulsion, the Magna Carta, England's great bulwark of liberty.

John of Gaunt (1340–1399), Duke of Lancaster, son of Edward III. and father of Henry IV., one of the most powerful English nobles of his day. In Wat Tyler's rebellion his palace in the Savoy was destroyed.

John, Augustus Edwin, O.M., R.A. (1878–1961), outstanding British painter, especially notable for his portraits. Among others, he painted Lloyd George, Bernard Shaw, and T. E. Lawrence. His works in the Tate Gallery include *The Smiling Woman* and *Galway*.

Johnson, Amy, C.B.E. (1903–1941), was the first woman aviator to fly solo from England to Australia, when she made a record flight to India (6 days to Karachi). Lost her life when flying as a pilot of the Air Transport Auxiliary over the Thames Estuary.

Johnson, Lyndon Baines (b. 1908), American politician who as Vice-President automatically became President of the United States on the death by assassination of Kennedy on 22 Nov. 1963. In the 1964 presidential election he won a decisive victory over Senator Goldwater, the Republican candidate. Senator from Texas since 1948. *See also* Section C, Part I.

Johnson, Dr. Samuel (1709–1784), the great lexicographer and writer, who for a number of years was the most prominent literary man in England. His *Dictionary* was published in 1755, before which he had attained eminence by several works including the *Vanity of Human Wishes*. His *Rasselas* appeared in 1759, and for two years he published *The Idler*, a collection of essays after the style of the *Spectator*. His *Lives of the Poets* appeared in 1781. He was greatly honoured during his life, enjoyed a pension of £300 a year from 1762, at his death was buried in Westminster Abbey, and had the best biography in the language written upon him by James Boswell.

Johnston, Sir Harry (Hamilton), G.C.M.G., K.C.B. (1858–1927), was a daring and successful explorer, who led scientific expeditions into the interior of Africa. Helped to crush the Arab slave trade in East Africa and to add Nyasaland and part of N. Rhodesia to the British empire.

Joliot-Curie, Jean Frédéric (1900–58), French physicist. His wife Irène (1896–1956), daughter of Pierre and Marie Curie, was also a distinguished scientist. Their discovery of artificial radioactivity brought them a Nobel Prize in 1935. Both were dismissed from the French Atomic Energy Commission because of their sympathy for communism.

Jones, Ernest Charles (1819–69), one of the best-known leaders of the Chartist movement, was sentenced in 1848 to two years' imprisonment for his revolutionary speeches.

Jones, Sir Harold Spencer, K.B.E., F.R.S. (1890–1960), Astronomer Royal, 1933–55; H.M. Astronomer Cape of Good Hope, 1923–33. His major research was to determine the mean distance of the earth from the sun, 93,004,000 miles.

Jones, Inigo (1573–1652), a noted architect, who became known as "the English Palladio," and built, among other famous structures, the Banqueting Hall at Whitehall and the gateway of St. Mary's at Oxford. He was a Royalist, and suffered severely in the Civil War.

Jonson, Ben (1573–1637), a friend of Shakespeare and one of the great poets and dramatists of his age. Was Poet Laureate from 1619. His best plays are *Every Man in his Humour* and *The Alchemist*. Buried in Westminster Abbey.

Josephine, Empress (1763–1814), was the wife of Napoleon I. until he divorced her in 1809 and married Marie Louise. Josephine had previously been married to Vicomte Alexandre Beauharnais, by whom she had two children.

Josephus, Flavius (A.D. 38–c. 100), Jewish historian whose *History of the Jewish War* and *Antiquities of the Jews* contained much valuable historical evidence bearing upon Biblical history.

Joule, James Prescott, F.R.S. (1818–1889), one of the greatest of English physicists, famous for his researches on electro-magnetism and for his determination of the mechanical equivalent of heat.

Jowett, Benjamin (1817–93), English scholar remembered as the greatest Master of Balliol College, winning a great reputation for his sympathy and erudition. His outstanding works include translations of the *Dialogues of Plato* and *History of Thucydides*. His Mastership raised Balliol to a proud pre-eminence among the Colleges.

Jowitt, William Allen, Earl, P.C. (1885–1957), Lord High Chancellor in the Labour Governments, 1945–51. Pub. *The Strange Case of Alger Hiss* (1953).

Joyce, James (1882–1941), Irish author who because of the originality, daring, and range of his work exercised a great influence on the younger school of novelists, critics, and poets. Notable among his works are *Portrait of the Artist as a Young Man*, *Ulysses*, and *Finnegans Wake*.

Juin, Alphonse, Marshal of France (1888–1967), C.-in-C. of French troops in N. Africa, 1942; Res.-Gen. in Morocco, 1947–51; C.-in-C. Allied Forces, Central Europe (NATO), 1951–56.

Julian the Apostate (Flavius Claudius Julianus) (331–363) was Roman Emperor for the last two years of his life, during which period he was an avowed pagan, though previously he had professedly been a Christian. He was slain by an arrow during an expedition against Persia.

Julius Cæsar. (See **Cæsar Caius Julius.**)

Jung, Carl Gustav (1875–1961) Swiss psychiatrist, founder of the Zür School, and a former pupil of Freud (*q.v.*) until 1911, when he formulated a system of analytical psychology. (See Section J.)

Junot, Andoche, Duc d'Abrantès (1771–1813), one of Napoleon's great generals, brilliantly successful until defeated by Wellington at Vimeiro.

Jusserand, Jean Adrien Antoine Jules (1855–1932), French author and diplomat; Ambassador to U.S.A., 1902–25. A well-known authority on English literature, his works include *The English Theatre from the Conquest to Shakespeare* (1878), *The English Novel* (1886), *The Literary History of the English up to the Renaissance* (1894).

Justinian I. (Flavius Anicius Justianianus) (483–565) was the Roman Emperor of the East whose fame rests chiefly on his laws. His *Corpus Juris Civilis* remained the accepted text-book of Roman Law to the end of the 9th century, and is still the most important of all monuments of jurisprudence. He reigned from 527 to 565.

Juvenal (Decimus Junius Juvenalis) (60–140), the famous Roman poet and rhetorician of the age of Trajan. His sixteen celebrated *Satires* are the finest in classical literature.

Kafka, Franz (1883–1924), Jewish writer, born in Prague, whose introspective work, the bulk of

which was not published till after his early death from tuberculosis, has been widely acclaimed and discussed, and has had a notable influence on later schools, including the Surrealists. *See also* M5.

Kālidāsa (c. A.D. 400), the most illustrious figure in classic Sanskrit literature and one of the greatest Oriental poets. No facts are known about his life and date, but certain evidence places him in the 5th cent. Seven of his works survive: two lyrics, *Ritu-samhara* (The Seasons), and *Megha-dūta* (Cloud Messenger); two epics, *Raghu-vamśa* (Dynasty of Raghu) and *Kumāra-sambhava* (Birth of the War-God); and three dramas, *Śakūntalā*, *Mālavikāgnimitra*, and *Vikramorvaśīya*.

Kant, Immanuel (1724–1804), great German philosopher, author of three great *Critiques: Critique of Pure Reason* (1781), *Critique of Practical Reason* (1788), and *Critique of Judgement* (1790). He came from a Pietist family of Königsberg and was influenced by the writings of his neighbour Hamann (*see* Romanticism, J39) and by Rousseau and Hume. His own works were of immense influence in shaping the liberal thought of the 18th and 19th centuries. He was a man of humanitarian ideas and believed passionately in the freedom of man to make his own decisions and considered the exploitation of man as the worst evil.

Kapitsa, Pyotr (b. 1894), one of Russia's greatest physicists; worked with Rutherford on atomic research at the Cavendish Laboratory, Cambridge; returned to Russia in 1935. Dir. Inst. for Physical Problems, Academy of Sciences of the U.S.S.R.

Kauffmann, Angelica, R.A. (1741–1807), the famous Anglo-Swiss painter, who was one of the foundation members of the Royal Academy, and the first woman R.A.

Kaulbach, Wilhelm von (1805–1874), an eminent German painter who illustrated books by Goethe and Schiller.

Kean, Charles John (1811–1868), an English actor-manager, son of the tragedian, Edmund Kean. Charles Kean married Ellen Tree, and in the 'fifties played with her in a series of spectacular revivals at the Princess's Theatre in London.

Kean, Edmund (1787–1833), one of the greatest tragic actors in the of history the British stage.

Keats, John (1795–1821), the great English poet who, though dying at the early age of twenty-five, produced a number of poems which in richness of imagination and beauty of thought are not excelled by anything in the language. His *Odes*, his two poems, *Isabella* and *The Eve of St. Agnes*, are exquisite in form and expression.

Keble, John (1792–1866), an English clergyman and poet, whose *Christian Year* is one of the most notable works of its class.

Keene, Charles (1823–1891), one of the most talented of the *Punch* artists.

Kellogg, Frank Billings (1856–1937), American statesman, chiefly remembered as the originator of the Kellogg Pact, for which he was awarded the Nobel Peace Prize for 1929.

Kelvin, William Thomson, Lord, P.C., O.M., G.C.V.O., F.R.S. (1824–1907), the famous scientist and inventor, introduced the dynamical theory of heat. Shortly afterwards he interested himself in submarine telegraphy, and invented numerous important improvements, also doing splendid work in the direction of electrical invention; he covered a vast field and earned a world-wide reputation.

Kemble, Frances Anne ("Fanny") (1809–1893), was a noted actress in the early part of the 19th century. She was the daughter of Charles Kemble (1775–1854), who was also a celebrated actor, associated in many appearances with his brother, John Philip Kemble and their talented, sister, Mrs. Siddons (*q.v.*).

Kempenfelt, Admiral Richard (1718–1782), an English naval officer who saw distinguished service, and sank with his ship the *Royal George* off Spithead, through a shifting of the guns when refitting which caused the vessel to capsize. Some six hundred of the ship's company perished with their admiral.

Kempis, Thomas à (1380–1471), name by which the German mystic and writer Thomas Hammerken was known, was a monk of the St. Augustine order, whose life was mainly spent at a monastery near Zwolle. He was the author of *The Imitation of Christ*, a work which has been translated into all languages.

Kennedy, John Fitzgerald (1917–63), President of the United States, 1961–63, the youngest and the first Roman Catholic ever to be elected, son of a wealthy financier. He enjoyed a world-wide personal pre-eminence and gave to the American people a new sense of purpose to meet the changes and challenges of a scientific age. He fought to end racial discrimination and though he had small success in getting his legislation through Congress, he made his mark in foreign affairs, initiating a new era in East-West relations. This youthful, talented, and mature statesman was assassinated during a motorcade drive through Dallas, Texas, on 22 November 1963. *See also* Section C, Part I.

Kent, William (1684–1748), a leading figure in British art, 1725 until middle of eighteenth century—architecture, landscape gardening, interior decoration, furniture, and painting. Strong Italianate influence. Surviving works: The Great Hall at Holkham, Norfolk, and layout at Rousham, Oxfordshire.

Kenyatta, Jomo (b. 1893), African national leader who became Kenya's first Prime Minister (1962) and first President (1964) when Kenya became a Republic within the British Commonwealth.

Kepler, Johann (1571–1630), renowned German astronomer, assistant to Tycho Brahe (1546–1601), whose measurements he used in working out his laws of planetary motion, which are: 1. The planets describe elliptic orbits, of which the sun is one focus. 2. The line joining a planet to the sun sweeps out equal areas in equal times. 3. The square of the period of revolution of a planet is proportional to the cube of its average distance from the sun. The explanation of these laws was given by Newton.

Keyes, Admiral of the Fleet, Lord, G.C.B., K.C.V.O., C.M.G., D.S.O. (1872–1945). Commodore of the submarine service during war of 1914–18, and commanded operations against Zeebrugge in 1918.

Keynes, John Maynard, 1st Baron, C.B., M.A., F.B.A. (1883–1946), British economist of international reputation. Bursar and Fellow of King's College, Cambridge. His *Treatise on Money* (1930) and *The General Theory of Employment, Interest and Money* (1936) profoundly influenced economic thought and government policy all over the world. Led the British delegation to Bretton Woods and negotiated the American loan agreement of 1945.

Khrushchev, Nikita Sergeyevich (b. 1894), Russian statesman who became leader of the Soviet Union soon after the death of Stalin; First Secretary of the Soviet Communist Party, 1953–64; Prime Minister, 1958–64. After the harsh years of the Stalinist régime radical changes became essential and he pursued a policy of relaxation both in home and foreign affairs. Relations with American improved but relations with China became strained. Great advances were made in scientific achievement, notably in the field of space research. In Oct. 1964 his posts were taken over by Leonid Brezhnev (First Secretary) and Alexei Kosygin (Prime Minister). *See also* Section C, Part I.

Kierkegaard, Sören (1813–55), Danish philosopher and religious thinker whose views have had great influence on contemporary existentialism. His main work is *Either—Or*.

King, Martin Luther (1929–68), American clergyman and Negro integration leader; awarded 1964 Nobel Peace Prize for his consistent support of the principle of non-violence in the coloured people's campaign for civil rights. Assassinated.

King, Rt. Hon. (William Lyon) Mackenzie, O.M., C.M.G. (1874–1950), Prime Minister of Canada, 1921–25, 1926–30 and 1935–48.

Kingsley, Charles (1819–1875), English clergyman and novelist, best known for his historical novels *Hypatia, Westward Ho!, Hereward the Wake* and children's book *The Water Babies*.

Kipling, Rudyard (1865–1936), poet, novelist, and miscellaneous writer. Made himself celebrated while yet a youth by some exceedingly clever and characteristic sketches of Indian life written for the most part while performing journalistic duties in India. He subsequently settled in

London and produced a remarkable succession of stories, sketches, ballads, and poems, all marked by intense vigour. In 1907 was awarded the Nobel Prize.

Kirchhoff, Gustav Robert (1824–87). German physicist. He did important work in electricity and thermodynamics and put spectrum analysis on a firm basis. Published, among other scientific works, *Researches on the Solar Spectrum.*

Kitchener, of Khartoum, Field Marshal Earl, K.G., K.P., G.C.B., O.M. (1850–1916), British soldier. By his victory at Omdurman in 1898 he crushed the Sudanese dervishes and avenged General Gordon. In the early stages of the South African War he assisted Lord Roberts and took over command himself in 1900. C.-in-C. India, 1902–9; Secretary of War, 1914–16. Drowned while on his way to Russia.

Klee, Paul (1879–1940), Swiss artist, studied at Munich, Paris and Rome and later became Professor at Düsseldorf Academy. He lived in a restless, experimental period. His paintings are small-scale, delicate dream-world fantasies, full of poetical content.

Kneller, Sir Godfrey, Bt. (1646–1723), the most celebrated portrait painter of his day in England, who enjoyed the patronage in succession of Charles II., James II., William III., Anne, and George I.

Knox, John (1505–1572), the famous divine and Reformer, who stirred Scotland to mighty religious impulses in the reign of Mary Queen of Scots.

Knox, Edmund George Valpy ("Evoe") (*b.* 1881), editor of *Punch*, 1932–48.

Knox, Rt. Rev. Mgr. Ronald Arbuthnot (1888–1957), Catholic Chaplain at the University of Oxford,1926–39, and a well-known author. His works include detective stories, among which are *The Viaduct Murder* and *Footsteps at the Lock.*

Koch, Robert (1843–1910), the most noted bacteriologist of the time, whose discoveries in connection with the bacillus of tuberculosis have greatly benefited mankind. He also closely studied the causes of Asiatic cholera and bubonic plague.

Kodály, Zoltán (1882–1967), Hungarian composer and teacher. He worked with Bartók in the collection of folk-tunes and his compositions include chamber music, sonatas, songs, the great choral work *Psalmus Hungaricus*, the orchestral suite *Háry János*, and the symphony in C, written in 1961. *See* Section E.

Kokoschka, Oskar (b. 1886), Austrian portrait and landscape painter, ranking as one of the world's great interpretative artists. Taught (1920–24) at the Dresden academy of art, lived for a time in Prague before settling (1938) in England.

Koniev, Marshal of Soviet Union, Ivan Stepanovich (b. 1898), one of Russia's outstanding military leaders in the war against Germany, 1941–45.

Korolyov, Sergei (1907–1966), Russian space scientist who designed the world's first earth satellite, the first manned spaceship and the first moon rocket.

Kosciusko, Tadeusz Andrzej Bonawentura (1746–1817), a Polish general and patriot who achieved great distinction in 1794 by his gallant leading of the Polish revolutionary forces against Russia. From 1776 to 1783 took part in the American War of Independence.

Kossuth, Louis (1802–1894), a Hungarian patriot and leader, who in the struggle for his country's freedom in 1849 was for a time successful, but ultimately had to acknowledge defeat, and fled first to Turkey and afterwards to England, where he lived for some years.

Kosygin, Alexei Nikolayevich (b. 1904), succeeded Nikita Khrushchev as chairman of the Council of Ministers of the U.S.S.R. (Prime Minister) in Oct. 1964; formerly a deputy chairman of the State Economic Planning Commission, Gosplan.

Kreisler, Fritz (1875–1962), world-famed Austrian violinist, studied in Paris under Massart. First played in United States in 1888. He composed numerous violin pieces, a quartet, and some operettas. Became an American citizen in 1943.

Krenek, Ernst (b. 1900), Austrian composer of partly Czech descent. He first composed in a neo-classic or anti-romantic style, later the influence of jazz was prominent in his compositions, which include the jazz opera *Jonny spielt auf* and many instrumental works and songs. In 1938 he emigrated to the United States.

Kropotkin, Peter Alexeivich, Prince (1842–1921), anarchist, geographer and explorer, who, after a distinguished career in Russia, his native country, was imprisoned for favouring the political action of a working men's association, but escaped to England. He wrote many important books on socialistic and geographical subjects. Returned to Russia in 1917.

Krüger, Stephanus Johannes Paulus (1825–1904), the Boer leader, was one of the outstanding figures of South Africa in the last half of the nineteenth century. As a small boy he accompanied his family on the Great Trek. He was active in Transvaal politics for many years, and served as President from 1883 to 1900. His attitude towards the Uitlanders (English and other non-Boer white inhabitants of the Transvaal) produced much of the tension which led to the South African War. During the war he made unsuccessful attempts to secure help for the Boers from various European powers.

Krupp, Alfred (1812–1887), the famous German engineer, founded the great gun factories at Essen, which were the largest in the world. By his introduction of the Bessemer plan of casting steel and the steam hammer into Germany, he brought about an important development in heavy breech-loading guns, and built up factories which employed at the time of his death 20,000 workmen.

Kubelík, Jan (1880–1940), Czech violinist—son of a gardener at Michle, near Prague—who at the age of twelve played in public, and was one of the most renowned instrumentalists of his day. His son Rafael (b. 1914), a conductor of international repute, became musical director of the Royal Opera House, Covent Garden, in 1955.

Kublai Khan (1216–1294), a famous Mogul emperor and grandson of Jenghiz Khan. He greatly extended the Mogul empire by conquest, and lived in unparalleled splendour.

Lablache, Luigi (1794–1858), a famous bass singer and actor, especially popular in London. He held the position of singing tutor to Queen Victoria.

La Fayette, Marie Joseph Paul Roch Yves Gilbert du Motier, Marquis de (1757–1834), French soldier and humanitarian politician who fought on the side of the Colonists in the American War of Independence and on returning to France became C.-in-C. of the National Guard of Paris. By signing the demand that the king summon the States-General he became the first leader of the French Revolution, but stood out against its later excesses. In 1830 he was instrumental in setting Louis Philippe on the French throne.

La Fontaine, Jean de (1621–1695), the celebrated French poet and fabulist. His fables have been translated into all languages, and are unique.

Lagerlöf, Selma, Ph.D. (1858–1940), the famous Swedish novelist who was awarded in 1909 the Nobel Prize for literature. In 1914 was elected the first woman member of the Swedish Academy.

Lagrange, Joseph Louis, Comte (1736–1813), noted French astronomer and mathematician.

Lalande, Joseph Jerome Lefrançais de (1732–1807), a famous French astronomer and director of the Paris Observatory. He founded the Lalande yearly prize for the best astronomical work or observation and wrote a well-known treatise on astronomy.

Lamarck, Jean Baptiste Pierre Antoine de Monnet, Chevalier de (1744–1829), the prominent French zoologist who occupied important scientific posts in Paris. A precursor of Darwin, his name rests mainly on his theory of the evolution of animals, known as Lamarckism. His chief work was the *Histoire Naturelle des Animaux sans Vertèbres.*

Lamb, Charles (1775–1834), one of the most delightful of our essayists. His *Essays of Elia* are characterised by great felicity of expression, much genial humour and an ardent love both of rural life and London life. He was a clerk in the office of the East India Company for thirty-five years. In some of his writings he was assisted by his sister, Mary Lamb, to whom he was greatly devoted.

Lamb, Sir Horace, F.R.S. (1849–1934), a British scientist, was the leading authority on hydro,

dynamics, and did valuable research work on wave motions and electricity.

Lambert, Constant (1905–51), English composer, conductor and critic; musical director of the Sadler's Wells Ballet. His *Rio Grande* for chorus, piano, and orchestra, shows some jazz influence.

Landor, Walter Savage (1775–1864), English poet and writer, best known for his *Imaginary Conversations*.

Landseer, Sir Edwin Henry, R.A. (1802–1873), the most celebrated English animal painter of his time. He designed the lions for the base of the Nelson Monument in Trafalgar Square.

Lane, Edward William (1801–1876), English Arabic scholar, translator of the *Arabian Nights*.

Lanfranc (c. 1005–89), Italian churchman, b. at Pavia; Archbishop of Canterbury, 1070. Closely associated with Duke William of Normandy (William I. of England); carried out Church reforms and preserved its independence.

Lang, Andrew (1844–1912), Scottish scholar and writer of great versatility, his numerous works including poetry, fiction, history, fairy tales, folk-lore, and translations from the classics.

Lang of Lambeth, Most Rev. Cosmo Gordon Lang, 1st Baron, P.C., G.C.V.O., D.D. (1864–1945), Archbishop of Canterbury, 1928–42; and of York, 1908–28; Bishop of Stepney, 1901–08.

Langland, William (c. 1330–1400), author of the alliterative poem *The Vision of Piers the Plowman*.

Langton, Stephen (1151–1228), was Archbishop of Canterbury from 1213, and one of the chief instruments in forcing the Magna Carta from John

Lansbury, Rt. Hon. George (1859–1940). British Labour politician; Chairman of Parliamentary Labour Party, 1931–35, Leader of the Labour Party, 1932–35. M.P. Bow and Bromley, 1910–12, and 1922–40.

Lao-Tzû, one of the ancient philosophers of China, who flourished about 600 B.C. The classic upon which his fame rests, *Tao-tê-ching*, was written many years later. (*See* **Taoism. Section J.**)

Laplace, Pierre Simon, Marquis de (1749–1827), French mathematician and astronomer whose researches on the motions of the solar system and the theory of probability earned him the title of "the Newton of France."

La Rochefoucauld, François, Duc de (1613–1680), a renowned French statesman and writer of the Louis XIV. period. His *Reflections and Moral Maxims* is a classic.

Lasker, Emanuel, Ph.D. (1868–1941), world's chess champion, 1894–1921—defeated by Capablanca (*q.v.*).

Lassalle, Ferdinand (1825–64), founder of the German Socialist movement, and as such exerted deep influence throughout Europe. His life story forms the basis of George Meredith's novel *The Tragic Comedians*.

Lasso, Orlando di (c. 1532–94), Flemish composer and choirmaster, contemporary of Palestrina, and the writer of over 2,000 compositions, including *chansons*, madrigals, and sacred music.

Laszio de Lombos, Philip Alexius, M.V.O. (1869–1937), the most fashionable portrait painter of modern times. President of Royal Society of British Artists, 1930.

Latimer, Hugh (*circa* 1485–1555), the English Reformer who became Bishop of Worcester under Henry VIII., but when Mary came to the throne was condemned as a heretic and burned at the stake.

Laud, William (1573–1645), an eminent ecclesiastic, who, after filling three minor bishoprics, was made Archbishop of Canterbury in 1633. He did much to direct the policy of Charles I., and when trouble followed, he was impeached by the Long Parliament and committed to the Tower. Was tried for treason and beheaded.

Lauder, Sir Harry (MacLennan) (1870–1950), famous singer of Scottish songs and ballads. Composed own songs and wrote own music. Knighted 1919 for services in raising money for war purposes.

Laval, Pierre (1883–1945), French politician, won notoriety over the Hoare–Laval pact in 1935. During the German occupation he was the arch French collaborator, and was afterwards tried for treason and shot.

Lavery, Sir John, R.A. (1856–1941), an eminent portrait painter; Pres. of the Royal Society of Portrait Painters, 1932–41.

Lavoisier, Antoine Laurent (1743–1794), often called the "father of chemistry," was born in Paris, and was the first to establish the fact that combustion is a form of chemical action.

Law, Rt. Hon. Andrew Bonar (1858–1923), Conservative politician. He became leader of the Opposition in 1911, joined the Coalition in 1915, and served as Prime Minister from 1922 until shortly before his death in 1923.

Lawrence, David Herbert (1885–1930), one of the most powerful and original of modern novelists, and as a poet ranked among the best this century has produced. Author of *The White Peacock*, *Sons and Lovers*, *The Plumed Serpent*, etc. *See also* **Contemporary Novel, Section M.**

Lawrence, Sir Thomas, P.R.A. (1769–1830), one of the fashionable portrait painters of his day.

Lawrence, Col. Thomas Edward (1888–1935), known as "Lawrence of Arabia," British soldier, archaeologist and explorer. Organised and led the Arabs against the Turks in the war of 1914–18. Author of *The Seven Pillars of Wisdom* (1926), of which an abbreviated edition, *Revolt in the Desert*, was published in 1927.

Leacock, Stephen Butler (1869–1944), Head of Dept. of Economics, McGill University, Montreal, 1908–36; but best known throughout the world as a humorous writer.

Leavis, Frank Raymond (b. 1895), outstanding literary critic, university teacher at Downing College, Cambridge, 1930–62. Edited the influential quarterly magazine *Scrutiny* from 1932 until its demise in 1963. His critical works include *The Great Tradition* (1948), *D. H. Lawrence, Novelist* (1955), and *Anna Karenina and Other Essays* (1967).

Lecky, Rt. Hon. William Edward Hartpole, O.M. (1838–1903), an eminent historian. His best-known works are *The History of England in the Eighteenth Century* and *The History of European Morals*.

Leclerc (de Hauteclocque), General Jacques Philippe, Marshal of France (1902–1947), French soldier of considerable personal popularity. Was Governor of the Cameroons in 1940, declared for the Free French and later led a Free French force from Lake Chad across the Sahara desert to join the Allied Forces in North Africa. Liberated Paris in 1944; commanded French troops in Indo-China, 1946. Killed in air crash in Algeria.

Le Corbusier, pseudonym of Charles-Edouard Jeanneret-Gris (1887–1965), Swiss-born French architect and town-planner whose works and theories with their emphasis on organic planning have profoundly influenced contemporary architecture. Famous for his *ville radieuse* conception of a city and architect of *L'Unité d'Habitation* at Marseilles and of Chandigarh, the joint capital of Punjabi Suba and Hariana.

Lee of Fareham, Viscount, P.C., G.C.B., G.C.S.I., G.B.E. (1868–1947). First Lord of the Admiralty, 1921–22. Minister of Agriculture, 1919–21. Presented Chequers Court to the nation as a residence for British Premiers, 1917.

Lee, Robert Edward (1807–70), was one of the ablest Confederate generals in the American Civil War, and C.-in-C. when the final surrender was made at Appomattox in 1865.

Lee, Sir Sidney (1859–1926), the great authority on Shakespeare, and joint editor with Sir Leslie Stephen of the *Dictionary of National Biography*, exercising undivided control over the completion of that monumental work during the last ten years of its publication.

Leech, John (1817–1864), perhaps the most popular of all the *Punch* artists, whose sketches and cartoons were the life and soul of the paper for many years.

Lehar, Franz (1870–1948), Hungarian composer chiefly of light operas, which include *The Merry Widow*, *The Count of Luxembourg*, *Frederica*, *The Land of Smiles*.

Leibnitz, Gottfried Wilhelm, Freiherr von (1646–1716), German writer and philosopher and one of the world's supreme intellects. Invented the infinitesimal calculus which he published in 1684, independently of Newton whose previous work on the same subject was published in 1687.

Leicester, Robert Dudley, Earl of (1531–88), son of John, Duke of Northumberland (*q.v.*), was a

favourite of Queen Elizabeth. He commanded the English troops in the Netherlands, 1585–87, and in England before the Armada. Married to Amy Robsart (q.v.).

Leif Ericsson (fl. A.D. 1000), discoverer of Vinland on the north-east coast of America; born in Iceland, the son of the Norse explorer, Eric the Red, who first colonised Greenland.

Leighton, Frederick, Baron, P.R.A. (1830–96), English painter whose popular pictures dealt with classical subjects, characterised by delicacy of finish and splendour of colour.

Lely, Sir Peter (1618–80), the famous painter to whom we owe so many of the portraits of the beauties of the Court of Charles II. He was born at Soest and his proper name was Van der Faes.

Lenin, Vladimir Ilyich Ulyanov (1870–1924). Russian revolutionary and statesman, architect of the Russian revolution for which cause he worked both "underground" in Russia and abroad during the years 1893–1917. It was in this period that the revolutionary Social-Democratic party was formed. An uncompromising revolutionary group, known as the Bolsheviks, developed within this party and Lenin was its leading spirit. In April 1917 Lenin and his fellow exiles returned to Russia. After the 1917 November revolution Lenin headed the new government and with intense energy consolidated the revolution, applying Marxist principles without dogmatism to the planning of Soviet social and industrial development.

Leonardo da Vinci (1452–1519), Italian painter, sculptor, architect, scientist, engineer, and musician. His creative power as an artist and scientist mark him as a supreme example of Renaissance genius. He went to Milan c. 1482 and worked for 16 years in the service of the powerful prince Ludovico Sforza. He was for a time with Cesare Borgia on his campaigns and died in exile as a pensioner of Francis I of France. Among his works are the famous *Last Supper*, *Mona Lisa*, *Madonna of the Rocks*, and *St. John the Baptist*.

Leoncavallo, Ruggiero (1858–1919), Italian composer of opera whose *Pagliacci* was his one outstanding success.

Leonidas was king of Sparta at the time of the invasion of Greece by Xerxes, 480 B.C., and led the defence of the Pass of Thermopylæ, where he fell.

Lermontov, Mikhail Yurevich (1814–41), great Russian poet and novelist, exiled to the Caucasus for the passionate, revolutionary poem addressed to Czar Nicholas I. written on the death of Pushkin. He has often been called the poet of the Caucasus, for the stern, mountainous country of his youth and exile had a great influence on his poetry. His novel *A Hero of Our Time* was written while he was at St. Petersburg in 1839. Lost his life in a duel.

Le Sage, Alain René (1668–1747), author of the famous stories *Gil Blas* and *Le Diable Boiteux*, also a dramatist of note.

Lesseps, Vicomte Ferdinand de (1805–94), an engineer of large ideas who, while Vice-Consul at Alexandria, conceived the plan of the Suez Canal, which work was completed in 1869. He afterwards projected the original Panama Canal, which failed.

Lessing, Gotthold Ephraim (1729–81), a noted German critic and dramatic poet, whose most celebrated work was his *Laokoon*.

Leverhulme of the Western Isles, 1st Viscount (1851–1925). Chairman and founder of the soapmaking firm of Lever Brothers, Port Sunlight, which later, by purchase and amalgamation, increased in size and importance to become Unilever Ltd.

Leverrier, Urbain Jean Joseph (1811–77), the French astronomer, co-discoverer with John Couch Adams of the planet Neptune.

Levi-Strauss, Claude (b. 1908), eminent French anthropologist and philosopher, leading exponent of structuralism. His works include *Les Structures elémentaires de la parenté*, *Tristes tropiques*, and *Mythologiques: Le Cru et le Cuit*, vol. I.

Lewis, Cecil Day, C.B.E., M.A., D.Litt. (b. 1904), poet and critic. Prof. of Poetry, Oxford Univ., 1951–6. Compton Lecturer in Poetry at Hull Univ. 1967–. Besides poetical works he has published translations of Virgil's *The Georgics* and *The Aeneid*; also detective novels under pseudonym of Nicholas Blake. Succeeded John Masefield as Poet Laureate in 1967.

Lewis, Sinclair (1885–1951), an American author who secured his first great success in 1920 with his novel of provincial American life, *Main Street*. *Babbitt*, published two years later, ruthlessly satirised the 100 per cent. disciple of American *Big Business*, and added a new term, "Babbitry," to the American language. Awarded the Nobel Prize for literature, 1930.

Liaquat Ali Khan (1895–1951), leader of the Moslem League (1946) and first Prime Minister of Pakistan after independence in 1947. Assassinated at Rawalpindi.

Lidgett, Rev. Dr. John Scott, C.H., M.A., D.D. (1854–1953), founder of the Bermondsey Settlement (1891); joint editor of the *Contemporary Review*; leader of Progressive Party on L.C.C., 1918–28; a former President of the National Free Church Council.

Lie, Trygve (b. 1896), Sec.-Gen. of the United Nations 1946–52. Formerly a leading Norwegian politician and Foreign Minister, 1941–46.

Liebermann, Max (1847–1935), German impressionist painter. Among his finest pictures are *The Flax Spinner*, *The Woman with Goats*, and *The Net-Menders*.

Li Hung Chang (1823–1901), an enlightened Chinese statesman and general, who by sheer ability rose from a humble position to be Chief Minister, and exercised almost supreme control for a number of years.

Lilburne, John (1614–57), an English political agitator and pamphleteer, who became the leader of the Levellers, the democratic party in the English Revolution.

Linacre, Thomas (c. 1460–1524), humanist scholar and physician, founder of the College of Physicians. Published translations of Galen's works.

Lincoln, Abraham (1809–65), was a native of Kentucky; in early life he became a lawyer, and was returned to Congress in 1846 from Springfield, Illinois, and in 1861 was elected 16th President of the United States, when he delivered his famous anti-slavery pronouncement, which led to the Civil War of 1861–65. In 1864 he was re-elected, and in the following year was assassinated by John Wilkes Booth.

Lind, Jenny (1820–87), a famous prima donna, "the Swedish nightingale" as she was called, who made a great sensation by her wonderful voice for some seasons in Europe, London and in America, from 1837 onward.

Linnæus, Carl von Linné (1707–78), a tireless Swedish doctor and scientist who became one of the most distinguished of naturalists, and the founder of modern botany. His *Systema Naturae* was published in 1735, and other monumental works followed. First to expound the true principles for defining genera and species.

Lippi, Fra Filippo (1406–69), one of the great artists of the Italian quatrocento, whose frescoes can be seen in Prato Cathedral. His son Filippino (1457–1504) was equally gifted and executed many great works, including frescoes in the Carmine, Florence, and the altar-piece *Virgin and Saints* in the Uffizi Gallery.

Lippmann, Gabriel (1845–1921) French physicist, whose more important work was in the field of colour photography. His numerous inventions include the capillary-electrometer, which bears his name, and many other delicate instruments. Nobel Prize for Physics, 1908.

Lippmann, Walter (b. 1889), American journalist, who began writing for the New York *Herald Tribune* in 1931 an influential column which moved to the Washington *Post* in 1962.

Lipton, Sir Thomas Johnstone, Bt., K.C.V.O. (1850–1931), Scottish merchant and yachtsman; after several years in the United States he returned to his native Glasgow and opened a grocery store. A pioneer in publicity, he became within a few years the world's biggest shopkeeper. He made five attempts to win the America's Cup.

Lister, Lord, P.C., O.M., F.R.S. (1827–1912), achieved renown for his discovery of the antiseptic treatment which has accomplished so much on behalf of surgery. Pres. of Royal Socy. 1895–1900; and of British Assn. 1896.

Liszt, Franz (1811–86). Hungarian pianist and composer, whose brilliant playing astonished

and delighted Europe and rather overshadowed his importance as a composer. He originated the symphonic poem. His daughter Cosima married Wagner.

Litvinov, Maxim Maximovich (1876–1952), Russian diplomat and statesman; Soviet Diplomatic Agent to Great Britain, 1917, Commissar for Foreign Affairs, 1929–39; Soviet Ambassador to United States, 1941–43.

Liu Shao-ch'i (b. 1898), Chinese Communist leader; succeeded Mao Tse-tung as Head of State in 1959 and until the "cultural revolution" of 1966–67 considered to be his heir-apparent.

Livingstone, Dr. David (1813–73), the great Scottish explorer and missionary, whose discoveries in Africa included the course of the Zambesi, the Victoria Falls, and Lake Nyasa. He opened up Central Africa to the influences of Christianity, and stirred the public conscience to the horrors of the Slave Trade. In 1871 considerable apprehension was felt in regard to his fate, but he was discovered by H. M. Stanley at Ujiji near Lake Tanganyika.

Lloyd, Marie (1870–1922), English music-hall artist and genius of Cockney comedy.

Lloyd George of Dwyfor, Earl, O.M. (1863–1945), Chairman of the Liberal Party, 1924–31. Prime Minister, 1916–22. M.P. for Caernarvon, 1890–1944. As a War Premier he displayed activity, resourcefulness, and driving power, which proved a tremendous influence in bringing about the defeat of Germany; and at the Peace Conference, in conjunction with Clemenceau and President Wilson, he was a master spirit. His daughter Lady Megan Lloyd George (d. 1966) who was Liberal M.P. for Anglesey, 1929–51, joined the Labour Party in 1955.

Locke, John (1632–1704), one of the great English liberal philosophers and founder of empiricism, the doctrine that all knowledge is derived from experience. His chief work in theoretical philosophy, *Essay Concerning Human Understanding*, was written just before the revolution of 1688 and published in 1690. Other writings include: *Letters on Toleration*, *Treatises on Government*, and *Education*.

Lombroso, Cesare, M.D. (1836–1909), famous Italian criminologist; in 1889 published his monumental work *L'uomo delinquente*, in which he put forward the theory that there was a definite criminal type which could be distinguished from the normal type, both anatomically and psychologically. He did much by his writings to hasten prison reform.

Lomonosov, Mikhail Vasilyevich (1711–65), Russian poet, philosopher, and scientist, associated with the foundation of Moscow University in the reign of the Empress Elizabeth.

London, John Griffith ("Jack") (1876–1916), an American novelist who led an adventurous life and wrote many popular novels and stirring books of adventure.

Longfellow, Henry Wadsworth (1807–82), an American poet who produced a number of volumes of poetry of great purity of thought and beauty of language. Author of *Hiawatha*.

Lonsdale, Dame Kathleen D.B.E., F.R.S. (b. 1903), Professor of Chemistry and head of the Dept. of Crystallography, Univ. College, Univ. of London. Pres. British Association, 1968.

Lonsdale, 5th Earl of, K.G., G.C.V.O. (1857–1944), was a well-known sportsman whose special interests were horse-racing, hunting and boxing, the Lonsdale belts having been founded by him.

Lope de Vega Carpio, Félix (1562–1635), founder of the Spanish drama, and one of the great figures of Spanish literature. He was one of the most prolific of writers, his dramatic productions alone numbering 1500 plays, of which some 450 survive.

Louis IX. (1214–70), St. Louis, king of France, crusader, and peace-maker, fulfilled the medieval ideal of the knightly king. Memoirs by the Sire de Joinville.

Louis XIV. (1638–1715), ruled France as absolute monarch after Mazarin's death in 1661, having come to the throne at the age of 5. Asserted French supremacy but had to face coalition of European powers (League of Augsburg and the Grand Alliance). The war of the Spanish succession and his own extravagance exhausted France. Revoked Edict of Nantes (1685). The magnificent palace at Versailles is a fitting monument to one who considered himself the most powerful monarch in Christendom.

Louis XV. (1710–74), French king during whose reign France was involved in the war of the Austrian succession, and the Seven Years war which resulted in the loss of Canada, India, and Senegal to England. Among his mistresses were the celebrated Mme de Pompadour and Mme du Barry.

Louis XVI. (1754–93), king of France whose history is the history of the French Revolution. Dominated by his queen, Marie Antoinette, faced with court intrigue, the cost of French intervention in the war of American Independence and the ruin of France's credit, the French Revolution began with the calling of the States-General in 1789. Executed 21 Jan. 1793.

Louis, Joe (b. 1914), American world heavyweight boxing champion, son of a Negro sharecropper. Established a record by successfully defending his title 24 times in the years 1937–48. Retired from the ring in 1949.

Low, Archibald Montgomery, D.Sc. (1888–1956), a distinguished British scientist who had many inventions to his credit connected with wireless, television, coal and petrol engines, anti-aircraft and anti-tank rocket apparatus.

Low, Sir David Alexander Cecil (1891–1963), celebrated political cartoonist who interpreted events for the British reader for over 30 years; invented a number of stock characters, including Colonel Blimp and the T.U.C. carthorse. Born in New Zealand, he came to Britain in 1919 and joined *The Star*. Subsequently his cartoons appeared in the *Evening Standard*, the *Daily Herald*, and the *Guardian*.

Lowell, James Russell (1819–91), an American writer and poet of singular power and humour.

Lowell, Robert (b. 1917), American poet, expert on European poetry, author of the verse play *The Old Glory* and *Life Studies* (1959), an autobiographical volume in verse and prose.

Loyola, St. Ignatius (1491–1556), was the founder of the order of Jesuits.

Lucretius (Titus Lucretius Carus) (99–55 B.C.), great Roman poet of antiquity, whose life-work was the poem *On Nature* (*De rerum natura*).

Ludendorff, General Erich (1865–1937), German soldier; Chief of the General Staff to Hindenburg with whom he shared the military leadership of Germany during the Great War. Largely responsible for the victory of Tannenberg and the successes of 1915.

Lugard, Frederick, Lord (1858–1945), British colonial administrator, a man of abounding energy, initiative, tact and firmness, and possessing considerable military abilities. Helped to build up the British dominions in tropical Africa (Nyasaland, Uganda, Nigeria) and to establish the principles of British African administration, notably the system of "indirect rule" through native rulers.

Luther, Martin (1483–1546), leader of the Protestant Reformation in Germany; entered the order of Austin Friars in 1505, ordained priest in 1507, taught at Wittenberg university and preached in the town church. Until 1517 he was an orthodox Roman Catholic. His first idea of revolt occurred when he saw indulgences being sold, a practice which he openly condemned. For this he was excommunicated, and summoned before the Diet at Worms, where he made a memorable defence. He lived to see the principles of the Reformation widely established. (*See* **Lutheranism, Section J.**)

Luthuli, Albert (1899–1967), ex-Zulu chief, former Pres. of the now banned African National Congress, who upheld non-violence in face of cruel laws against his people in S. Africa. Killed in train accident. Nobel Peace Prize, 1960; Rector Glasgow Univ., 1962.

Lutyens, Sir Edwin Landseer, O.M. (1869–1944), English architect; designed and restored many country houses and castles (e.g., Lindisfarne), architect Hampstead garden suburb, 1908. Other works include the Cenotaph in London, city plan and viceroy's house, New Delhi, British Embassy, Washington, Liverpool R.C. cathedral. Pres. Royal Academy 1938–43.

Lyell, Sir Charles (1797–1875), British geologist whose great *Principles of Geology* (1830–33) profoundly influenced 19th-century scientific thought and helped to shape Darwin's ideas.

Lyell was responsible for the division of the Tertiary period into Pliocene (*Greek* = more recent), Miocene (less recent) and Eocene (dawn of recent).

Lysenko, Trofim (b. 1898). Russian biologist whose concept of genetics, that environmental experiences can change heredity, though discredited in scientific circles outside the U.S.S.R., was accepted there as dogma until 1953.

Lytton, Edward George Earle Bulwer, 1st Baron, P.C., G.C.M.G. (1803–73), a prolific novelist and dramatist, whose romantic stories included *The Last Days of Pompeii.*

M

Macadam, John Loudon (1756–1836). Scottish engineer who invented the process of road-repairing which bears his name.

MacArthur, General Douglas, Hon. G.C.B., D.S.C., D.C.M. (1880–1964). American soldier famous for his gallant defence of the Philippines against the Japanese, 1941–42. Relieved of his commands in the Far East during the Korean campaign by President Truman in April 1951.

Macaulay, Rose, D.B.E. (1881–1958), an English authoress and literary critic. Among her literary successes are *Potterism, Dangerous Ages, Told by an Idiot, Orphan Island* and other novels noted for their keen satirical wit.

Macaulay, Thomas Babington, Lord (1800–59), the most brilliant historian of the Victorian era. His fame was assured by his *Essays* and *Lays of Ancient Rome*, and his *History* did more than confirm it. He was a son of Zachary Macaulay (1768–1838), the anti-slavery agitator, and sat in Parliament as member for Calne for some years, also serving for five years as a member of the Supreme Council of Calcutta. On his homecoming, he again entered Parliament as member for Edinburgh, and gained a new celebrity by his speeches. He served as Paymaster-General and Secretary for War.

Macbeth, immortalised by Shakespeare, was maormor of Moray and succeeded Duncan as king of Scotland in 1040, having slain him in fair fight. He appears to have governed the kingdom with great ability and equity. Defeated and slain by Malcolm Canmore, eldest son of Duncan in 1057. Shakespeare's Macbeth is based on the story in Holinshed and is not true to the historic figure.

MacCarthy, Sir Desmond, F.R.S.L., Hon. D.Litt., Hon. LL.D. (1877–1952), journalist and critic who became dramatic critic to *The Speaker*, 1904, and *The New Statesman*, 1913, where he soon made a reputation both for the substance and style of his writings. He edited *The New Quarterly*, 1907–10 and later *Life and Letters*. Latterly was literary critic to *The Sunday Times*.

McCormack, (Count) John (1884–1945), was the world famous Irish tenor who became a naturalised American citizen in 1919; received a Papal peerage as Count from Pius XI in 1928.

MacDiarmid, Hugh (pseudonym of Christopher Murray Grieve) (b. 1892), Scottish poet, the greatest since Burns. He stood as a Communist candidate against Sir Alec Douglas Home at Kinross in 1964.

Macdonald, Flora (1722–90), Scottish Jacobite heroine who saved the life of Prince Charles Edward after the defeat at Culloden Moor in 1746.

Macdonald, Sir John Alexander (1815–91), Canadian statesman of great vigour and imagination who became the first Prime Minister of the Dominion of Canada.

MacDonald, Rt. Hon. James Ramsay (1866–1937), Prime Minister in the first two Labour Governments, 1924, 1929–31, and in a Coalition Government dominated by Conservatives, 1931–35. His son, Malcolm (b. 1901), has held a number of diplomatic posts and in 1965 was appointed Special Representative of the British Government in Kenya, Tanzania, Malawi, and Zambia.

McDougall, William, F.R.S. (1871–1938), British psychologist. Professor of Psychology at Harvard University 1920–27, and Duke University, North Carolina 1927–38. His *Introduction to Social Psychology* (1908) achieved international reputation.

Machiavelli, Niccolo (1469–1527), Florentine diplomat, the first social scientist and theorist of the modern state, whose famous book *The Prince*, written in 1513, is concerned with the reality of politics. He believed that the end justifies the means.

Mackail, Prof. John William, O.M. (1859–1945), British classical scholar, Prof. of Poetry at Oxford, 1906–11, and translator of the *Odyssey*.

McKell, Sir William John, G.C.M.G., K.C. (b. 1891), Gov.-Gen. of Australia 1947–52.

Mackenzie, Sir (Edward Montague) Compton, O.B.E. (b. 1883), British novelist; literary critic to the *Daily Mail*, 1931–35; Rector of Glasgow Univ., 1931–34.

Macmillan, Rt. Hon. Harold, M.C. (b. 1894), British statesman; Prime Min., 1957–63. First entered Parliament in 1924 as Conservative M.P. for Stockton-on-Tees; represented Bromley, Kent, 1945–64; served as Minister of Housing and Local Government, Min. of Defence, Foreign Sec., Chancellor of the Exchequer. He is a member of the well-known publishing family. Chanc. Oxford University, 1960. *Winds of Change, 1914–1939*, the first volume of his autobiography, was published in 1966. *See also* Section C, Part I.

McMillan, Margaret, C.H., C.B.E. (d. 1931), Scotswoman, born in America who with her sister Rachel was a pioneer of child welfare work. Founder of open-air nursery schools. The Rachel McMillan nursery school at Deptford is a memorial to her work.

McNaughton, Gen. Hon. Andrew George Latta, C.H., D.S.O. (b. 1887), Canadian soldier, politician, electrical engineer, and representative on the U.N. Atomic Energy Commission.

Macneice, Louis (1907–63), English poet, B.B.C. script writer, and producer and director of many radio plays.

Macready, William Charles (1793–1873), English actor and manager who established himself as a tragedian of the first rank.

Maeterlinck, Count Maurice (1862–1949), Belgian man of letters whose plays include *La Princesse Maleine, Pelléas et Mélisande*, and *L'Oiseau Bleu*. Well known for his work on bees and ants.

Magellan, Ferdinand (*c.* 1480–1521), a famous Portuguese navigator, and commander of the first expedition (1519) to sail round the world.

Mahler, Gustav (1860–1911), Austrian composer and conductor; a writer of symphonies and songs, a classical romantic, much influenced by Anton Bruckner and Wagner. He completed nine symphonies (some with voices), and examples of his work in song-cycle form are *Das klagende Lied, Kindertotenlieder*, and *Das Lied von der Erde* (for solo voices and orchestra). *See* Section E.

Maintenon, Françoise d'Aubigné, Marquise de (1635–1719), after being the wife of the poet Scarron, drifted into Court circles, and so fascinated Louis XIV, that he ultimately married her. At his death she retired to a convent.

Makarios III, Archbishop (b. 1913), Cypriot ecclesiastic and national leader. Deported by British to Seychelles, 1956–57. Pres. of Rep. of Cyprus since independence, Aug. 16, 1960.

Malibran, Marie Félivité (1808–36), was one of the most famous operatic singers of her time.

Malik, Yakov Alexandrovich (b. 1906), Soviet diplomat who has been Deputy Min. of Foreign Affairs, Permanent Rep. of U.S.S.R. to U.N., 1948–52, and Soviet Ambassador to Great Britain, 1953–60.

Malory, Sir Thomas (*c.* 1430–70), compiled the *Morte d'Arthur*, which was printed by Caxton in 1485, and relates the story of King Arthur and the Knights of the Round Table.

Malraux, André (b. 1895), French novelist whose works include *La Condition humaine* (*Man's Fate*), *L'Espoir* (*Man's Hope*), and *Psychologie de l'art* (translated into 2 vols., *Museum without Walls* and *The Creative Act*).

Malthus, Thomas Robert, F.R.S. (1766–1834), an English clergyman and economist who in his essay *The Principle of Population* contended that population growth could only be checked by war and disease and by moral restraint.

Malvern, 1st Viscount, Godfrey Martin Huggins, C.H., K.C.M.G., F.R.C.S. (b. 1883), Prime Min. of S. Rhodesia, 1933–53 and of the Federation of Rhodesia and Nyasaland, 1953–56.

Manet, Édouard (1832–83), French Impressionist painter, whose pictures *Olympia* and *Lola de Valence* have been acclaimed masterpieces.

Mann, Thomas (1875–1955), German writer who won immediate world recognition at the age of 25 with his novel *Buddenbrooks*. His liberal humanistic outlook had developed sufficiently by 1930 for him unerringly to expose the nature of National Socialism. He left Germany in 1933 to live in Switzerland and then settled in the United States. Awarded the Nobel Prize for Literature in 1929; E. and W. Germany combined to honour him with the Goethe Prize in 1948. His best-known works, apart from many volumes of essays, stories, and shorter novels, are *The Magic Mountain* (1924), the *Joseph* tetralogy (1935–43), *Dr. Faustus* (1947) and *Felix Krull* (1954).

Mann, Tom (1856–1941), was a prominent British Labour leader for more than 50 years.

Manning, Henry Edward, Cardinal (1808–92). Cardinal Archbishop of Westminster 1875–92, was a prominent Anglican Churchman up to 1851, when he joined the Church of Rome.

Mansfield, Katherine (1890–1923), short-story writer, born in Wellington, New Zealand, whose work was strongly influenced by the short stories of Chekov. Her second husband was John Middleton Murry, author and literary critic.

Manson, Sir Patrick, G.C.M.G., M.D., F.R.S. (1844–1922), an eminent physician who specialised in parasitology and became physician and medical adviser to the Colonial Office. He was the first to formulate the hypothesis that the malarial parasite was transmitted by the mosquito. The joint work of Sir Patrick Manson and Sir Ronald Ross rendered habitable vast areas of the earth hitherto closed.

Manuzio, Aldo Pio (1450?–1515), Italian printer, founder of the Aldine press in Venice, which for just over a century issued books famed for their beautiful type and bindings.

Manzoni, Alessandro Franceso Tomaso Antonio (1785–1873), Italian writer, whose romantic novel *I Promessi Sposi* (" The Betrothed ") is generally regarded as the most important work in Italian literature after "The Divine Comedy."

Mao Tse-tung (b. 1893), great leader of the Chinese people. Chairman of the Central Committee of the Chinese Communist Party since 1936 and Chairman (equivalent to President) of the People's Republic of China from 1949 (when it was first established following the military defeat of the Nationalist forces) until the end of 1958 when the duties of President were relinquished. *See also* **Section C, Part I.**

Marat, Jean Paul (1743–93), one of the leading actors in the French Reign of Terror. Killed by Charlotte Corday.

Marconi, Guglielmo Marchese (1874–1937), Italian electrical engineer celebrated for his development of wireless telegraphy. With a home-made apparatus he sent long-wave signals over a distance of 1 mile in 1895. He came to England in 1896 and established the Marconi Company in 1897. Succeeded on Dec. 12, 1901 in transmitting and receiving transatlantic signals. Awarded Nobel Prize for Physics, 1909.

Marco Polo. (*See* **Polo, Marco.**)

Marcus Aurelius Antoninus (121–180), the greatest of Roman emperors and a disciple of the stoics.

Maria Theresa (1717–80), Archduchess of Austria, Queen of Bohemia and Hungary; a woman of remarkable strength of character and ability, succeeded her father Charles VI., as monarch of the Hapsburg dominions. She was an enlightened ruler and has been called a " benevolent despot."

Marie Antoinette Josephe Jeanne (1755–93) was daughter of the Empress Maria Theresa and the Emperor Francis I. of Austria, and became wife of Louis XVI. of France. She entered with spirit into the gaiety of French Court life, and drew down upon herself much popular hatred in consequence. In the terrible events which followed the outbreak of the Revolution she was one of the chief sufferers, but bore her fate with dignity and resignation, and met her death on the scaffold with unflinching courage.

Marie Louise (1791–1847), daughter of Francis I. of Austria, became wife of Napoleon in 1810, and bore him a son. (*See* **Napoleon II.**)

Marius, Caius (c. 155–86 B.C.), the famous Roman general of humble birth who became tribune (119 B.C.), praetor (115 B.C.), propraetor in Spain (114 B.C.) and was seven times consul. Married an aunt of Julius Caesar.

Mark Antony. (*See* **Antonius, Marcus.**)

Marlborough, John Churchill, 1st Duke of (1650–1722), brilliant soldier, the victor of Blenheim, Ramillies, Oudenarde, and Malplaquet. Married to Queen Anne's favourite, Sarah Jennings.

Marlowe, Christopher (1564–93), one of the greatest of the Elizabethan dramatists. His principal plays are *Dr. Faustus*, *Tamburlaine the Great*, *Edward II.*, and *The Jew of Malta*. He was killed in a tavern brawl at Deptford.

Marryat, Captain Frederick (1792–1848), an exceedingly popular writer of sea stories. Author of *Peter Simple*, *The King's Own*, *Jacob Faithful*, and *The Children of the New Forest*.

Marshall, General George Catlett (1880–1959), American soldier and statesman; Chief of Staff of U.S. Army, 1939–45. Initiated the American offer of aid to Europe, which led to the European Recovery Programme. Nobel Peace Prize, 1953.

Martial (Marcus Valerius Martialis) (A.D. c. 40–A.D. c. 104) was born at Bilbilis in Spain, but spent the greater part of his life in Rome, where he acquired much fame as a poet and epigrammatist.

Marvell, Andrew (1620–78), English poet, satirist and diplomatist, friend of Milton, who was best known for his many prose satires and lampoons.

Marx, Heinrich Karl (1818–83), German philosopher and socialist and lifelong partner and friend of Engels with whom he collaborated in writing many important works on socialism and in developing his theories of dialectical materialism. After being expelled from the continent he settled in London where he wrote his monumental work *Das Kapital*. Communism is based on the teachings of Marx. During the 1850s he lived at 28 Dean Street, Soho. Buried at Highgate Cemetary. *See* **Marxism, J27,** *also* **Q14(2).**

Mary I. (1516–58), daughter of Henry VIII. and Catherine of Aragon. Was Queen of England from 1553 to her death. She was a strenuous Roman Catholic, and entirely reversed the religious order of things during her brief reign, persecuting, imprisoning, and burning at the stake many of the Protestant reformers, nearly three hundred persons being put to death as heretics. She married Philip of Spain in 1554.

Mary II. (1662–94), daughter of James II; came to the English throne in 1689, having married her cousin, William of Orange, in 1677. After assenting to the " Declaration of Rights," they reigned jointly until her death.

Mary, H.M. Queen, K.G., K.T., G.C.V.O. (1867–1953), Queen Consort of George V.

Mary, Queen of Scots (1542–87), daughter of James V. of Scotland, married to the Dauphin of France at sixteen years of age. On the death of her husband in 1560 she returned to Scotland, and for a time was the acknowledged Queen of the Scots. In 1565 she married Lord Darnley, who a year later was murdered and Mary married Bothwell. The Scottish nobles rebelled against Mary, and she was made prisoner and confined in Loch Leven Castle, compelled to abandon Bothwell and to sign an Act of Abdication in favour of her son. She escaped to England, sought the protection of Elizabeth, and was imprisoned for nineteen years in various castles, and ultimately beheaded on a charge of conspiracy. She was buried in Peterborough Cathedral but after her son James I. of England ascended the throne her remains were removed to Westminster Abbey.

Masaryk, Jan Garrigue (1886–1948), son of Thomas Masaryk. Served as Czech Minister in London, 1925–38 and as Foreign Secretary, 1940–48.

Masaryk, Thomas Garrigue (1850–1937), Czech philosopher and statesman, one of the greatest fighters for a democratic society; founder and first President of Czechoslovakia, 1918–35.

Mascagni, Pietro (1863–1945), Italian composer, whose brilliant one-act opera *Cavalleria Rusticana* produced in 1890 brought him sudden celebrity. None of his later operas was as successful.

Masefield, John Edward, O.M., C.L. (1878–1967), English poet laureate, 1930–67. Most popular among his poems are the *Salt-Water Ballads*, *Reynard the Fox*, and *Right Royal*.

Maskelyne, John Nevil (1839–1917), famous illusionist who exposed the mysteries of the Davenport spiritualistic quacks.

Mason, Alfred Edward Woodley (1865–1948), an English novelist, author of many popular

stories of adventure including *The Four Feathers* and *Fire Over England*.

Massenet, Jules Émile Frédéric (1842–1912). French composer whose melodious compositions include songs, orchestral suites, oratorios, and 23 operas, among them *Manon* and *Thaïs*.

Massine, Léonide (b. 1896), a famous Russian dancer who was for some years Ballet Master at the Roxy Theatre, New York. Among his most famous ballets are *The Good Humoured Ladies, Boutique Fantasque, Pas d'Acier, Les Matelots, Le Beau Danube* and *Les Présages*.

Masters, Edgar Lee (1869–1950). American poet who occupies a permanent place in American literature by the publication in 1915 of his *Silver Spoon Anthology*, a hundred poems relating the real character as opposed to the eulogistic inscriptions on their tombstones of the dead in a typical American township.

Matisse, Henri (1869–1954). French painter, the foremost member of a group known as *les Fauves*. His work is remarkable for its use of pure and brilliant colour and its reliance on colour variations to express form and relief.

Matsys or Metzys, Quintin (1466–1530), a distinguished Flemish painter, who was originally a blacksmith. He excelled in Scriptural subjects.

Maugham, (William) Somerset, C.H., C.L. (1874–1965). British novelist, playwright, and short-story writer. Born in Paris, he qualified as a doctor, but soon abandoned medicine for literature, achieving a great success with his first novel in 1897, *Liza of Lambeth*, a study of slum life. He travelled widely which gave him a deep insight into human nature.

Maupassant, Henri René Albert Guy de (1850–93), the famous French author and writer of short stories, was a friend of Flaubert, Zola, and Daudet. He was the greatest of all European short-story writers, standing alone in grace, wit and epigram.

Mauriac, François (b. 1885). French novelist whose works are regarded as among the chief literary productions of to-day. In addition to a long series of novels he has written many critical works and essays. Leader-writer for *Figaro*; Nobel Prizewinner, 1952.

Maurois, André, Hon., K.B.E. (1885–1967). French biographer, novelist and essayist who has written lives of Shelley, Disraeli, Byron, Voltaire, Fleming, Dickens, and Balzac.

Maxim, Sir Hiram Stevens (1840–1916), the inventor of the famous automatic quick-firing gun.

Maxton, James (1885–1946), was a prominent Socialist politician; M.P. for the Bridgeton Divn. of Glasgow, 1926–46. Chairman of I.L.P. 1926–31 and 1934–39.

Maxwell, James Clerk (1831–79). Scottish physicist who wrote his first scientific paper at the age of 15. He was Professor of Natural Philosophy at Aberdeen, 1856, and at King's College, London, 1860–68. In 1871 he became the first Cavendish Professor of Experimental Physics at Cambridge. He brought his pre-eminently mathematical mind to bear on the results of the experimental discoveries of Faraday and others and gave to physics a celebrated set of equations which account for the basic laws of electricity and of magnetism. His work revolutionised the whole aspect of fundamental physics and led to great practical results. *See* Section F, Part I.

Mazarin, Jules (1602–61), an Italian Cardinal who became chief Minister of State under Louis XIV., and was for a number of years the practical ruler of France. He succeeded Richelieu.

Mazeppa-Koledinsky, Ivan Stepanovich (1644–1709), the hero of Byron's poem, was a real personage, and a Pole, and was tied naked on the back of a wild horse, and so sent out across the Russian desert, for an intrigue with a noble's wife. He was liberated by Cossacks and afterwards attained an honourable position.

Mazzini, Giuseppe (1805–72), an Italian patriot, who, in his endeavours to secure the independence of Italy, incurred the disfavour of the authorities, and was compelled to leave the country. He started a newspaper called *Young Italy* at Marseilles, and in 1837 came to London, and kept up his attacks upon existing governments. In 1848 he was back in Rome and was elected dictator of the Roman Republic. He was not allowed to hold this position long, however, for the French occupied Rome and Mazzini was driven to England again. The unification of Italy was accomplished in other ways than those advocated by Mazzini, but he lived to see Victor Emmanuel King of United Italy.

Medici, the famous Florentine family who combined the career of merchants and bankers with the exercise of political power and patronage of the arts. Cosimo the Elder (1389–1464) was for over thirty years the virtual ruler of Florence. He was wealthy, cultivated, liberal, and a consummate statesman. His illustrious grandson, Lorenzo the Magnificent (1449–92), poet, friend of artists and scholars, governed the state in great munificence. His grandson, Lorenzo, was the father of Catherine de' Medici, Queen of France (*q.v.*). Then the family had some reverses until Cosimo (1519–74), one of the most able rulers of the 16th cent., became Duke of Florence and then Grand-Duke of Tuscany, which title the Medicis held until 1737.

Méhul, Étienne Nicolas (1763–1817), French operatic composer, *Joseph* being considered his masterpiece. In his early years much influenced by Gluck.

Melanchthon, Philip (1497–1560). German scholar and humanist who assisted Luther and wrote *Loci communes*, the first great Protestant work on the principles of the Reformation.

Melba, Dame Nellie, G.B.E. (1861–1931), the celebrated Australian soprano, b. in Richmond (Victoria), who made her operatic début in Brussels in 1887.

Melbourne, 2nd Viscount (1779–1848). Queen Victoria's first premier, holding office over six years, and identified with many important Liberal measures.

Mendel, Gregor Johann (1822–84), Austrian botanist. After joining the Augustinian order, he moved to the monastery at Brünn where he afterwards became Abbot and taught natural history in the school there. His main interest, however, was the study of inheritance, and his elaborate observations of the common garden pea resulted in the famous law of heredity which to-day bears his name. His hypothesis was published in 1866 but no attention was given to it until 1900. *See* Section F, Part II.

Mendeleyev, Dmitry Ivanovich (1834–1907), Russian chemist who made important contributions to physical chemistry and general chemical theory. First to discover the critical temperatures and formulated the Periodic Law of atomic weights.

Mendelssohn-Bartholdy, (Jacob Ludwig) Felix (1809–47), German composer, grandson of Moses Mendelssohn, the philosopher. He belongs with Chopin and Schumann to the early 19th century classic-romantic school, and his music has a delightful delicacy and melodic beauty. He was conductor of the famous Gewandhaus concerts at Leipzig for a time and often visited England. Frequently performed are his overtures *A Midsummer Night's Dream* and *The Hebrides* (or *Fingal's Cave*), written in his youth, two oratorios *St. Paul* and *Elijah*, the violin concerto in E minor, the piano works *Variations Sérieuses* and *Songs without Words*, and the *Scotch* and *Italian* symphonies. The name Bartholdy was added to the surname when his father abandoned Jewry. *See* Section E.

Mendès-France, Pierre, LL.D. (b. 1907), French statesman. His skilful diplomacy and energy helped to solve the many problems that faced his country when he took office as Prime Minister in June 1954. His government was overthrown on his Algerian policy in Feb. 1955. Leader of the Radical Party minority which did not support the de Gaulle constitution.

Menuhin, Yehudi (b. 1916), violin virtuoso, one of the greatest musical prodigies of the 20th century. Born in New York of Jewish parentage; made his first London appearance in the San Francisco Orchestra, 1929.

Menzies, Rt. Hon. Sir Robert Gordon, K.T., C.H., Q.C. (b. 1894), Australian Liberal leader; Prime Minister, 1939–41, 1949–66. Lord Warden of the Cinque Ports, 1966.

Mercator, Gerhardus (1512–94), the Flemish geographer who invented a celestial and a terrestrial globe, by which he introduced his famous projection, in which meridians and parallels of latitude cross each other at right angles, both

being indicated by straight lines. This greatly simplified navigation.

Meredith, George, O.M. (1828–1909), novelist and poet, "the Grand old Man of English letters." His works are rich in imagery, poetry, wit, and characterisation, and as a delineator of womanhood he is unsurpassed. Among his great novels are *Ordeal of Richard Feverel*, *Evan Harrington*, *Rhoda Fleming*, *The Egoist*, *Diana of the Crossways*, and *The Amazing Marriage*.

Mesmer, Friedrich Anton (1733–1815), was a German doctor who founded the system of mesmerism or animal magnetism.

Mestrovic, Ivan (1883–1962), a Dalmatian sculptor, recognised as one of the leading European sculptors of his day. The Tate Gallery and the Victoria and Albert Museum have examples of his work.

Metastasio, Pietro (1698–1782), the celebrated Italian librettist who provided texts for such composers as Gluck, Handel, Haydn, and Mozart. He lived in Vienna as court poet and his real name was Pietro Bonaventura Trapassi.

Metchnikov, Ilya (1845–1916), an eminent Russian biologist; Nobel Prize for Medicine, 1908.

Meyerbeer, Giacomo (1791–1864), was born in Germany, but spent most of his life in Paris, where he produced all his great operas, which include *Robert le Diable*, *Les Huguénots*, and *L'Africaine*.

Meynell, Alice (1849–1922), English poet and essayist, wife of Wilfred Meynell (1852–1948), editor of the Catholic paper *Merry England*.

Michelangelo (**Michelagniolo Buonarroti**) (1475–1564), the renowned Italian painter, sculptor, architect and poet, whose genius was such a power in beautifying the churches of Rome and Florence. Was the last and in some respects the greatest of the Italian sculptors; while his large paintings, particularly *The Last Judgment*, in the Sistine Chapel, are no less famous.

Michelet, Jules (1798–1874), a noted French historian and author.

Michelson, Albert Abraham (1852–1931), American physicist, born in Poland. Designer of an interferometer for estimating the diameters of stars. Collaborated with E. W. Morley in the *Michelson-Morley* experiment to measure the velocity of the earth through the "ether" which led to the conclusion that the ether is non-existent, a finding which had great value for Einstein's theory of relativity. The first American scientist to win the Nobel prize for Physics, 1907, in which year he was also awarded the Copley Medal.

Mickiewicz, Adam (1798–1855), greatest Polish poet and revolutionary. Chief works *The Ancestors*, *Pan Tadeusz*.

Mill, John Stuart (1806–73), achieved high reputation by his numerous works on philosophical questions. He was an ardent liberal and leader of the utilitarian school of philosophy. Radical M.P. for Westminster, 1865–68, died in Avignon. His chief works are *Principles of Political Economy*, *System of Logic*, *On Liberty*.

Millais, Sir John Everett, Bt., P.R.A. (1829–96), was at one time the most prominent of the English Pre-Raphaelites, but soon cast himself free from their mannerisms, and began the production of a long series of famous pictures. Among his numerous works we have room to mention only *The Eve of St. Agnes*, *Autumn Leaves*, *The Order of Release*, *Effie Deans*, *Chill October*, and *Bubbles*.

Millet, Jean François (1814–75), one of the greatest of French painters of pastoral subjects; his celebrated work *The Angelus* is universally known by its numerous reproductions.

Millikan, Robert Andrews (1868–1953), American physicist who is world famous for his researches on electrons, and for discovering the cosmic rays. Professor of Physics at Chicago University 1910–21, and Director of the Norman Bridge Laboratory of Physics at Pasadena, California 1921–45. Awarded Nobel Prize for Physics, 1923.

Milne, Alan Alexander (1882–1956), English humorist, poet, and playwright who wrote much delightful verse and stories for children.

Milner, Alfred, Viscount (1854–1925), imperial statesman, who served in South Africa from 1897 to 1905 and had great influence on the history of that country. Was Secretary for War in 1918 and for the Colonies, 1919–21.

Miltiades (d. 489 B.C.), one of the leaders of the Athenian army against the Persians at Marathon.

Milton, John (1608–74), England's greatest epic poet, whose *Paradise Lost* is the greatest poem of the kind in the language. The best known of his other poems are probably the *Ode on the Morning of Christ's Nativity*, *L'Allegro*, *Il Penseroso*, *Lycidas*, and the sonnet *On his Blindness*. In 1652 he became totally blind, and at his death was buried in St. Giles's Church, Cripplegate, London, a monument being erected to his memory in Westminster Abbey.

Minot, George Richards, M.D. (1885–1950), an eminent American doctor who became Prof. of Medicine at Harvard in 1928, and famous for his researches in the pathology of the blood, and for his discovery of the curative properties of liver in pernicious anæmia. Shared the Nobel Prize for Medicine, 1934.

Mirabeau, Gabriel, Comte de (1749–91), one of the prominent figures of the French Revolution, and a famous orator.

Mistral, Frédéric (1830–1914), French poet who spent his whole life in Provence and wrote many works of great lyrical beauty, founded the Félibrige society (*q.v.* Gen. Inf.); completed *Lou Trésor dóu Félibrige* in 1886, a Provençal dictionary and encyclopædia of Provence. Nobel Literary Prize, 1904.

Mithridates (*circa* 132–63 B.C.), was King of Pontus from 120–63 B.C., and showed great capacity as a commander conquering a great part of Asia Minor and Greece.

Modigliani, Amedeo (1884–1920), Italian painter, b. Livorno, whose portraits and figure studies show a highly individual style. He spent most of his short life in Paris which was one of poverty, illness, and disillusionment.

Moffat, James (1870–1944), Scottish divine who translated the Bible into modern English.

Mohammed (570–632), the founder of Islam, the religion of the Moslems, fled from Mecca to Medina in 622, from which date the Mohammedan era opens. By his constant preaching and proclaiming of the one and only Deity Allah he gathered round him a small and loyal, hard, fighting band of followers and was able to return to Mecca eight years later, an acknowledged conqueror. The Sacred Book of Islam, the *Koran*—though presented by him as an original revelation from the Angel Gabriel—may in the main be traced to Biblical and Rabbinical sources. (*See* Islam, Section J.)

Moiseiwitsch, Benno, C.B.E. (1890–1963), Russian-born, naturalised British pianist, especially well known for his rendering of the works of the Romantics.

Molière (**Jean Baptiste Poquelin**) (1622–73), the greatest of French comic dramatists, who, from being a poor strolling player, became the leading dramatist of his time. His greatest comedies were *Le Tartuffe*, *Le Misanthrope*, *Le Malade imaginaire* and *Le Médecin malgré lui*.

Molotov, Vyacheslav Mikhailovitch (**Skryabin**) (b. 1890), Russian diplomat; succeeded Litvinov as Commissar for Foreign Affairs, 1939–49. Chief representative of the Soviet Union at numerous post-war conferences. Expelled from Communist Party, 1964.

Moltke, Field-Marshal Count Helmuth von (1800–91), was responsible for the Prussian strategy in the Danish, Austrian, and Franco-Prussian wars, in all of which he was outstandingly successful.

Mond, Ludwig, Ph.D., F.R.S. (1839–1909), German chemist who in 1867 settled in England as an alkali manufacturer and in partnership with John Brunner successfully manufactured soda by the Solvay process.

Monet, Claude (1840–1926), the most representative of the French Impressionists. Exhibited in 1874 his landscape *Impression Soleil levant*, from which the word *Impressionism* was derived.

Monier-Williams, Sir Monier, K.C.I.E., LL.D., Ph.D. (1819–99), a great Sanskrit scholar who laboured with distinction in bringing westward the wisdom of the Orient.

Monk, George, 1st Duke of Albemarle (1608–69), served with distinction as general and admiral, particularly in the Anglo-Dutch wars, and in 1660 effected the Restoration of Charles II.

Monroe, James (1758–1831), Fifth President of the U.S. Was appointed Governor of Virginia in 1799, and in 1803 went to France and carried

through the purchase of Louisiana. Best known as the author of the Monroe Doctrine, which he outlined in his Presidential message of 1823.

Montagu, Lady Mary Wortley (1689–1762), the greatest of English woman letter writers. The three volumes of her *Complete Letters* were published in 1965–67. *See also* P16(1).

Montaigne, Michel de (1533–92), a French essayist of world-wide celebrity, who may be regarded as the inventor of the essay form, and had a great influence on English writers.

Montcalm, General Louis Joseph, Marquis de (1712–59), commander of French Army against British in Canada in final struggle for possession. Defeated by Wolfe in 1759 and mortally wounded.

Montesquieu, Charles Louis de Secondat, Baron de La Brède et de (1689–1755), French philosopher and author. His works include *Les Lettres Persanes*, a witty satire on contemporary life, and *L'Esprit des Lois*, setting out his ideas on politics and law. Greatly admired England and her constitution, which he misunderstood, and his influence on the authors of the American constitution consequently led to the impractical separation of the executive (the President) from the law-making power (Congress).

Montessori, Maria (1869–1952), educationist, whose methods for infant teaching have wide recognition. *See* J14(2).

Monteverdi, Claudio (1567–1643), an Italian composer of importance by reason of his pioneer work in the operatic form. His most important dramatic work was *Orfeo* (1608). *See* Section E.

Montezuma II. (1466–1520) was Emperor of Mexico when Cortes invaded that country, and the last Aztec ruler of Mexico.

Montfort, Simon de, Earl of Leicester (1206–65), was a powerful baron, with liberal views, and a hatred of kingly tyranny. It was his bold action that forced Henry III., his brother-in-law, to grant the first English Parliament. He met his death at the Battle of Evesham.

Montgolfier, Joseph Michel (1740–1810) and **Jacques Etienne** (1745–1799), two French brothers who invented the first practical balloon.

Montgomery, Field-Marshal Viscount, K.G., G.C.B., D.S.O. (b. 1887), rose to military fame as Commander of the 8th Army in the North African and Italian campaigns, 1942–44. C.-in-C. British Forces in France and Germany 1944–46; C.I.G.S., 1946–48. Permanent Military Chairman of the Western Union Defence Committee, 1948–51; Deputy Supreme Allied Commander Europe (NATO), 1951–58. Retired 1958. His *Memoirs* were published in 1958.

Montrose, James Graham, Marquess of (1612–50), brave and inspiring Scottish general who raised the Highland clansmen for Charles I. and again for Charles II. His lyric poetry included *My dear and only love.*

Moody, Dwight Lyman (1837–99), the American revivalist preacher, associated for many years in mission work on both sides of the Atlantic with Ira D. Sankey, the "American Singing Pilgrim."

Moore, George (1852–1933), a well-known Irish novelist; author of *Confessions of a Young Man*, *Esther Waters*, *Evelyn Innes*, etc.

Moore, Henry, O.M., C.H. (b. 1898), greatest living sculptor in semi-abstract style, son of a Yorkshire coalminer. Examples of his work are to be seen in the Tate Gallery, St. Matthew's Church, Northampton, the Unesco Building in Paris, and on an outside site opposite the House of Lords.

Moore, Sir John (1761–1809), British general, who trained the infantry for the Spanish Peninsular campaigns and conducted a brilliant retreat to Corunna, where he was mortally wounded after defeating the French under Soult.

Moore, Thomas (1779–1852), Ireland's greatest poet, the author of *Irish Melodies*, *Lalla Rookh*, *The Epicurean*, and many other works. He enjoyed immense popularity both in England and Ireland. Friend and biographer of Byron.

More, Sir Thomas (1478–1535), succeeded Wolsey as Lord Chancellor under Henry VIII., but fell into disgrace by refusing to take the oath of Supremacy, and was ultimately executed. His *Utopia* (*see* J48) is one of the world's most noted books. Canonised in 1935 along with John Fisher, Bishop of Rochester, who was similarly martyred by Henry VIII.

Morgan, Sir Henry (c. 1635–88), Welsh buccaneer of great skill and daring; operated in the Caribbean against the Spaniards, capturing and plundering Panama in 1671. Knighted by Charles II. and made Deputy-governor of Jamaica.

Morgan, John Pierpont (1837–1913), one of the great financiers of his time who built the family fortunes into a vast industrial empire.

Morland, George (1763–1804), a painter of English rural life.

Morley, John, Viscount, O.M. (1838–1923) Liberal statesman and author, served as Secretary for Ireland in 1886 and 1892–95, and for India, 1905–10. Biographer of Gladstone, Voltaire, Rousseau, Burke, Walpole, Cromwell, and Cobden.

Morley, Thomas (c. 1557–1603), English Elizabethan composer of madrigals, noted also for his settings of some of Shakespeare's songs. He was a pupil of Byrd, organist of St. Paul's Cathedral, and wrote an important theoretical work *Plaine and Easie Introduction to Practicall Musie* (1597).

Morris, William (1834–96), poet and craftsman. His hatred of 19th-cent. ugliness, his belief in human equality, and in freedom and happiness for all, conspired to make him a socialist, and he accomplished much for the improvement of domestic decoration. He was a popular lecturer, founded the Socialist League and the Kelmscott Press.

Morrison of Lambeth, Herbert Stanley, Baron, P.C. C.H. (1888–1965), entered Parliament as Labour M.P. for S. Hackney in 1923. Leader of the L.C.C. 1933–40. Dep. Prime Min. and Leader of the House of Commons in the Labour administration, 1945–51. Life peerage conferred, 1959.

Morse, Samuel Finley Breese (1791–1872), an American artist and designer, who became the inventor of the Morse system of electric telegraphs, and of the Morse code of signals.

Moseley, Henry Gwyn-Jeffreys (1887–1915), lecturer in physics under Rutherford at Manchester Univ., 1910–12. Made great contributions to the theory of the structure of the atom. Killed at Gallipoli.

Mountbatten of Burma, 1st Earl, Admiral of the Fleet, P.C., K.G., G.C.B., G.C.V.O., D.S.O. (b. 1900), naval officer and statesman. Chief of Combined Operations, 1942–43; Supreme Allied Commdr. S.E. Asia, 1943–46; Viceroy of India, Mar.–Aug. 1947 and first Gov. Gen. of Dominion of India, Aug. 1947–June 1948. Resuming his naval career in 1948 he has served successively as Flag Officer Commanding the 1st Cruiser Squadron, Mediterranean, Fourth Sea Lord, C.-in-C. Mediterranean, C.-in-C. Allied Forces, Mediterranean, and First Sea Lord and Chief of Naval Staff, 1955–59, Chief of the Defence Staff, 1959–65.

Mountevans, Admiral Lord, K.C.B., D.S.O. (1881–1957), "Evans of the Broke," British sailor and explorer. Author of *South with Scott.*

Mozart, Wolfgang Amadeus (1756–91). The composer who bears this immortal name is universally acknowledged as the world's greatest musical genius. He was born at Salzburg, began his musical career at the age of four, toured the European courts as an infant prodigy, left the service of the Archbishop of Salzburg in his twenty-sixth year to live in Vienna, where his friendship with Haydn began and where his greatest music was written. Mozart's genius lies in the effortless outpouring of all forms of music, in the ever-flowing melodies, in the consistent beauty and symmetry of his compositions, and in the exactness of his method. Among the loveliest and grandest works in instrumental music are his three great symphonies in E flat, in G minor, and in C (called the "Jupiter"), all written in six weeks in 1788. Three of the greatest operas in musical history are his *Marriage of Figaro* (1786), *Don Giovanni* (1787), and *The Magic Flute* (1791). His last composition, written under the shadow of death, was the Requiem Mass, a work of tragic beauty. *See* Section E.

Müller, Ferdinand von, Baron (1825–96), German botanist and explorer. Director of the Botanical Gardens at Melbourne, 1857–78. Introduced the eucalyptus into the south of Europe and other regions, and took leading part in promoting Australian exploration.

Mumford, Lewis (b. 1895), American social historian and authority on town planning and urban culture. His works include the trilogy

Techniques and Civilization (1934), *The Culture of Cities* (1938), *The Condition of Man* (1944), and *The Myth of the Machine* (1967).

Munkacsy, Michael von (1844–1900), a celebrated Hungarian painter of historical subjects.

Munnings, Sir Alfred James, K.C.V.O. (1878–1959), British painter whose country scenes and pictures of horses have gained him world-wide fame. P.R.A., 1944–49.

Murdock, William (1754–1839), engineer and inventor, first to make practical use of coal gas as an illuminating agent.

Murillo, Bartolomé Esteban (1617–82), one of the greatest Spanish painters. His chief works are altar-pieces and religious subjects.

Murray, (George) Gilbert (Aime), O.M., D.Litt., D.C.L., LL.D. (1866–1957), classical scholar and humanist whose verse translations of Euripides are known throughout the world. Became Professor of Greek at Glasgow at early age of 23; Regius Professor of Greek at Oxford, 1908–36.

Mussolini, Benito (1883–1945), Fascist dictator of Italy, 1922–43. From 1935 an aggressive foreign policy in Abyssinia, Spain, etc., was at first successful, and in June 1940, he entered the second world war on the side of Germany. The defeat of Italian arms in North Africa and the invasion of Sicily caused the collapse of his Government, but he was rescued from imprisonment by parachutists. Executed two years later by partisans.

Mussorgsky, Modest Petrovich (1839–81), Russian composer whose masterpiece is the opera *Boris Godunov* after the play by Pushkin. His piano suite *Pictures at an Exhibition* was orchestrated by Ravel. *See* Section E.

N

Nansen, Fridtjof, G.C.V.O., D.Sc., F.R.G.S. (1861–1930), the Norwegian explorer who, after two or three expeditions across Greenland, in 1893 started out on his famous North Polar expedition when he reached the highest latitude until then attained—86° 14′—a feat later eclipsed by the Duke of the Abruzzi and by Peary, as well as by airship or aeroplane. He published a fascinating narrative of his exploration under the title of *Farthest North*. Active in Russian famine relief, 1921. Awarded Nobel Prize for Peace, 1922.

Napier, John (1550–1617), mathematician, who made important contribution to the advance of astronomy and other branches of science by his invention of logarithms (published 1614).

Napoleon I. (Bonaparte) (1769–1821) was born at Ajaccio in Corsica. Sent to France to receive a military education and was a captain at the age of twenty. In 1794 served in Italy with such distinction that he won a generalship, and next year was appointed Commander-in-Chief. A series of most brilliant successes followed. He defeated the Austrian forces in 1797, conducted an expedition to Syria and Egypt in 1798, returned in 1799 to find himself the most popular man in France, and in November of that year he proclaimed himself First Consul. In 1800 he was again in Italy and once more victorious. In 1804 he was made Emperor, and the following year was in the field against England, Russia, and Austria, achieving a splendid series of victories at Austerlitz and elsewhere, and practically became Dictator of Europe, distributing kingships amongst his brothers in the most profuse manner, Joseph becoming King of Naples, Louis King of Holland, and Jerome King of Westphalia. His invasion of Russia was disastrous, the Peninsular War went against him, and in 1814 the Allies entered Paris and forced him to abdicate. He was sent to Elba, but made his escape in the following year, gathered his old army about him and went forth to meet the English and Prussian armies. He was finally defeated at Waterloo on 18 June 1815, and held in captivity on the lonely island of St. Helena, where he died. His remains were removed to Paris in 1840, and rest in a magnificent tomb. Recent evidence suggests that he may have been murdered by arsenic poisoning.

Napoleon II. (1811–32) was the son of Napoleon I. and Maria Louisa. Was born in Paris and proclaimed King of Rome, but died of consumption when only twenty-one, being known at the time of his demise as the Duke of Reichstadt.

Napoleon III. (1808–73) was the son of Louis Bonaparte, King of Holland, and of Hortense, daughter of the Empress Josephine. After unsuccessful attempts to secure the French throne and years of imprisonment he took advantage of the revolution of 1848 to return to France and, following the famous *coup d'état* of December 2, 1851, emerged as master of France and was proclaimed Emperor the following year. Married Eugénie de Montijo in 1853. Dictatorial and discredited at home, unsuccessful in his foreign adventures, his surrender at Sedan in the Franco-Prussian war of 1870 brought ruin to the Second Empire, and France once again became a republic. Louis Napoleon took refuge in England and died at Chislehurst in Kent.

Nash, John (1752–1835), architect. Planned Regent Street, laid out Regent's Park, enlarged Buckingham Palace, and designed Marble Arch and the Brighton Pavilion.

Nash, Paul (1889–1946), distinguished English painter and designer. Official war artist in both world wars. Best known pictures *The Menin Road* of 1918 and *Totes Meer* of 1941.

Nash, Rt. Hon. Walter (b. 1882), New Zealand Labour politician; Prime Min., 1957–60. Resigned party leadership 1963.

Nasmyth, James (1808–90), the inventor of the steam-hammer, which became indispensable in all large iron and engineering works.

Nasser, Gamal Abdal (b. 1918), first President of the first Egyptian Republic and influential leader of the Arab world. Fought in Palestine War of 1948–49 and organised the military *coup* of July 23, 1952, which brought the abdication of King Farouk. The most important events of his presidency have been the nationalisation of the Suez Canal, the building, with Russian help and finance, of the Aswan High Dam, and the Middle East war of June 1967.

Needham, Joseph, M.A., Ph.D., Sc.D., F.R.S. (b. 1900), British biochemist, historian of science, orientalist; Fellow of Gonville and Caius, Cambridge, 1924–. Author of the great historical work *Science and Civilisation in China*.

Nehru, Pandit Jawaharlal (1889–1964), Indian statesman and one of the world's great leaders; Prime Min. and Min. of Foreign Affairs, 1947–64. Educated at Harrow and Cambridge where he studied science and law. A leading member of the Congress Party for many years, during which he was frequently imprisoned for his political activities. Played distinguished part in the final negotiations for the independence of India. Under his enlightened leadership India made dramatic technical, industrial, and social advances. *See also* Section C, Part I.

Nelson, Horatio, Viscount, K.C.B. (1758–1805), the great English naval commander; son of a Norfolk clergyman. Went to sea at twelve years of age, and was post-captain at twenty-one. In 1793 he was captain of the *Agamemnon* and proved his capacity and daring against the French. He lost his right eye at the siege of Calvi in 1794, and his right arm at the siege of Santa Cruz in 1797. In 1798 he achieved a great victory over the French in Aboukir Bay, in recognition of which he was created a Baron and granted a pension of £2,000 a year. Victorious at Copenhagen in 1801, he was promoted to the rank of Viscount. In 1805 the French fleet was destroyed at Trafalgar and Nelson was killed. Buried in St. Paul's Cathedral.

Nenni, Pietro (b. 1883), Italian politician and Secretary-General of the Italian Socialist Party since 1944. Minister of Foreign Affairs, 1946–47.

Nernst, Walther Hermann (1864–1941), German scientist who established the third law of thermodynamics. Nobel Prizeman, 1920.

Nero, Claudius Caesar (A.D. 37–68), the Roman Emperor whose reign of fourteen years was rendered infamous by his cruelty and licentiousness.

Newcomen, Thomas (1663–1729), was one of the first to put a steam-engine into practical operation, and in 1705 patented his invention, which was the pumping-engine used in Cornish mines until the adoption of Watt's engine.

Newman, Ernest (1868–1959), English music critic successively of *The Manchester Guardian*, *The*

Birmingham Post, *The Observer*, and of *The Sunday Times*, 1920–58. Outstanding among his numerous writings is the *Life of Richard Wagner*.

Newman, John Henry, Cardinal (1801–90). Educated at Oxford, he was incumbent of St. Mary's there from 1828 to 1843, taking an active part in the religious discussions of the time, gradually showing a tendency to adopt Roman Catholic views, and ultimately allying himself with the Romanists, resigning his living and settling at Edgbaston, Birmingham, as the head of a community of the Order of St. Philip Neri. In his *Apologia pro Vita Sua* he described the development of his religious thought. The hymn *Lead, kindly Light*, and the *Dream of Gerontius* were written by him.

Newton, Sir Isaac, F.R.S. (1642–1727), generally acknowledged as the world's greatest man of science. Achieved immortal fame for his work on the nature of white light, the calculus and gravitation Greatest published work, the *Principia*, was produced in 1687, revolutionising the scientific thought of his time. Was Member of Parliament for Cambridge in 1688, Master of the Mint in 1699, and President of the Royal Society from 1703 till his death. Honoured with knighthood in 1705.

Ney, Marshal Michel (1769–1815), was one of Napoleon's most noteworthy generals.

Nicholas II., Ex-Czar of Russia (1868–1918), son of the Emperor Alexander III. Came to the throne in 1894, and had a reign full of trouble, being unable to handle the difficulties by which he was beset. He avowed full harmony with the British and French in the war which opened in 1914, but the acts of the Empress and Court belied these pretensions, and a Revolution resulted in March, 1917, which overthrew the Romanoffs. Nicholas was detained a prisoner together with the Czarina and his children; all were probably shot on July 16, 1918.

Nicholas, St., Bishop of Myra and patron saint of Russia, flourished in the 4th century, and is popularly associated with Christmas under the corrupted name of Santa Claus.

Nicholson, Sir William (1872–1949), English painter, well known for his portraits, engravings and woodcuts as well as for his illustrations in the *Almanack of Twelve Sports* (with Kipling) and *London Types* (with Henley). His son, Ben Nicholson (b. 1894), also an artist, is noted for his abstract paintings.

Nicolson, Hon. Sir Harold, K.C.V.O., C.M.G. (b. 1886), author and critic, whose books include *The Congress of Vienna* (1946), *King George V.: His Life and Reign* (1952), *The Evolution of Diplomatic Method* (1954), *Good Behaviour* (1955). Married the Hon. Victoria Sackville-West (1892–1964), the novelist and poet.

Niemöller, Martin (b. 1892), German religious leader. A pastor in the Evangelical (Protestant) Church. Actively opposed the Nazification of the German Church and was incarcerated in a concentration camp throughout the second world war.

Nietzsche, Friedrich Wilhelm (1844–1900), German philosopher, in his younger years greatly influenced by the work of Wagner and Schopenhauer. His "superman" philosophy is eloquently expressed in his many writings, *i.e.*, *Thus spake Zarathustra*, *Beyond Good and Evil*, *The Will to Power*.

Nightingale, Florence, O.M. (1820–1910), English nurse and pioneer of hospital reform whose genius for administration was shown during the Crimean War, when she organised in face of considerable official opposition a nursing service to relieve the sufferings of the British soldiers who called her "The Lady with the Lamp." Her system was adopted and developed in all parts of the world, and she was honoured with a testimonial of £50,000, which she applied to the founding of the Nightingale Training School for Nurses, attached to St. Thomas's Hospital, London.

Nijinsky, Vaslav (1892–1950), Russian dancer, who was one of the famous company of dancers, which included Pavlova, Karsavina and Fokine, brought by Diaghilev to Paris and London just before the War of 1914–18, and was in some respects the most remarkable of them all. His sensational dancing in such Ballets as *Les Sylphides*, *Spectre de la Rose* and *Après-Midi d'un Faune* won him the supreme place among male dancers.

Nikisch, Arthur (1855–1922), famous Hungarian conductor, who appeared as a prodigy pianist at the age of eight, became chief conductor at the Leipzig Opera, 1879, conducted the Symphony Orchestra at Boston, 1889–93, afterwards paying visits to all the important cities of Europe.

Nimitz, Admiral of the Fleet Chester William 1885–1966), commanded the American fleet in the Pacific, 1941–45, together with army and marine forces. Chief of Naval Operations, 1945–47.

Nkrumah, Kwame (b. 1909), African leader whose country (Gold Coast) achieved independence in 1957, and in 1960 became the Republic of Ghana. Prime Min. (1957) and Pres. (1960). Deposed (1966) by military coup while absent in Far East.

Nobel, Dr. Alfred Bernhard (1833–96), the inventor of dynamite, was a Swedish engineer and chemist who amassed a large fortune from the manufacture of explosives, a great portion of which at his death in 1896 he set apart as a fund for annual prizes to such persons as during each year shall have contributed most materially to the benefit of mankind. *See* list of Nobel Prizemen, Section L.

Northcliffe, 1st Viscount, Alfred Charles William Harmsworth (1865–1922), British journalist and newspaper proprietor, b. near Dublin. He began *Answers* in 1888 with his brother Harold, later Lord Rothermere. In 1894 they bought the *Evening News*, and in 1896 the *Daily Mail*. In 1908 Northcliffe took over *The Times*.

Northumberland, John Dudley, Duke of (1502–53), an expert intriguer who dominated the Government of Edward VI. from 1549 onwards and attempted to maintain his influence when the king died by proclaiming as Queen his daughter-in-law, Lady Jane Grey, but failed and was executed.

Nostradamus or Michel de Notre Dame (1503–66), French astrologer who acquired great distinction by his labours during the plague. Publ. in 1555 *Centuries*, a book of rhymed prophecies, the fulfilment of some of which greatly added to his reputation. *Centuries* was condemned by the papal court of 1781.

Novalis, the pseudonym of Baron Friedrich von Hardenberg (1772–1801), German poet and novelist, representative of German romanticism. His chief work was the novel *Heinrich von Ofterdingen*, unfinished at his death.

Nuffield, 1st Viscount, William Richard Morris, G.B.E., C.H. (1877–1963), industrialist and philanthropist and until he retired in 1952 Chairman of Morris Motors, Ltd. Established the Nuffield Foundation, endowing it with £10 million, and provided large sums for the advancement of medicine in the University of Oxford.

Numa Pompilius, legendary king of Rome, to whom is ascribed Roman ceremonial law.

Nyerere, Julius (b. 1922), African statesman; President of the United Republic of Tanzania, 1964–. An autobiographical account of his life is given in Lady Listowel's *The Making of Tanganyika* (1966).

O

Oaksey, Geoffrey Lawrence, 1st Baron, P.C., Q.C., D.S.O. (b. 1880), presided over the International Military Tribunal which tried the major war criminals at Nuremberg, 1945–46. A Lord of Appeal in Ordinary since 1947.

Oates, Captain Lawrence Edward Grace (1880–1912), a British explorer who, having seen active service in the South African War, joined Capt. Scott's Antarctic Expedition in 1910. He was one of the sledge party who accompanied Scott in his final dash for the South Pole. On returning, the party became stormbound, and on March 17, 1912, Oates, crippled by frost-bite, went out in the blizzard to die rather than be a burden to his starving comrades. Described in Scott's diary as a very gallant gentleman.

Oates, Titus (1649–1705), a notorious informer against Roman Catholics in reign of Charles II.

O'Casey, Sean (1883–1964), Irish dramatist of remarkable powers whose plays include *Juno and*

the Paycock, *The Silver Tassie*, *Red Roses for Me*, and *Oak Leaves and Lavender*.

Occam (Ockham), William of (*c.* 1270–1349), English scholar and philosopher and one of the most interesting, independent and original thinkers of all time. He belonged to the Order of Franciscans, violently opposed the temporal power of the Pope, espoused the cause of nominalism and laid the foundations of modern theories of government and theological scepticism. (See **Occam's Razor**, **Section J**.)

O'Connell, Daniel (1775–1847), the Irish "Liberator," as he was called, was a famous orator and politician and a highly successful barrister. In Parliament he advocated the cause of Ireland with courage and audacity.

O'Connor, Feargus (1796–1855), was an Irish lawyer who became the most influential figure in the Chartist movement.

O'Connor, Rt. Hon. Thomas Power (1848–1929), sat in Parliament from 1880 until 1929, being for many years father of the house, and was one of the most successful journalists and editors of his time. He founded several publications including the *Star*.

Oersted, Hans Christian (1777–1851), the Danish physicist and chemist, whose discoveries in electrical research did much to help forward the invention of the electric telegraph.

Offa was King of Mercia from *circa* 757 to 796, and had a war-like career; he built an embankment from the Dee to the Wye, 100 miles long, which was called Offa's Dyke. He imposed "Peter's Pence" as a gift to the Pope for absolution.

Offenbach, Jacques (1819–80), French composer, born of a Jewish family at Cologne. Was the composer of many light operas, including the posthumous *Les Contes d'Hoffmann* (*Tales of Hoffmann*), the most popular of all his works.

Ohm, Georg Simon (1787–1854), was the discoverer of a law of electric current now known universally as Ohm's law. He was a native of Bavaria, professor at Munich from 1852, and gained much fame as a physicist and mathematician.

Olivier, Sir Laurence Kerr (b. 1907), British actor and director whose performances in Shakespearean and other roles have brought wide acclaim. He has also produced, directed, and played in many films, including Henry V., Hamlet, and Richard III. Director of the National Theatre.

Oman, Sir Charles (William Chadwick), K.B.E. (1860–1946), English historian who was Chichele Professor of Modern History at Oxford, 1905–46 and M.P. for the University from 1919 to 1935. His works include a popular *History of Greece*, *A Short History of England*, which is a familiar school book, and a *History of the Art of War in the Middle Ages*.

Omar Khayyám (*c.* 1050–1123), Persian poet and mathematician, called Khayyám (tent-maker) because of his father's occupation. His fame as a scientist has been eclipsed by his Rubaiyat, made known to English readers by Edward FitzGerald in 1859.

O'Neill, Eugene Gladstone (1888–1953), an American playwright who, after spending his adventurous youth in such activities as sailing, gold-prospecting, and journalism, first won success in 1914 with the one-act play, *Thirst*. His later plays include *Anna Christie*, *Strange Interlude*, *Mourning Becomes Electra*, *The Iceman Cometh*. *See also* **Section I**.

Orchardson, Sir William Quiller (1835–1910), an eminent R.A.; among his best-known works are *Napoleon I. on board H.M.S. Bellerophon* and *Ophelia*.

Origen (*c.* 185–*c.* 254), Christian philosopher and biblical scholar, famed for his teaching at Alexandria and Cæsarea. He attempted to synthesise Greek philosophy and Hebrew scriptures so as to prove the Christian view of the universe was compatible with Greek thought. In the persecution of Decius in 250 he was imprisoned, tortured, and pilloried.

Orpen, Sir William, K.B.E., R.A. (1878–1931), British portrait-painter; many of his celebrated war pictures were presented to the nation.

Ortega y Gasset, José (1883–1955), Spanish philosopher and essayist, one of the most eloquent men of our times. His *The Revolt of the Masses* (1932) brought him international fame.

Orwell, George (1903–50), English satirist, author of *Animal Farm* (1946) and *Nineteen Eighty-Four* (1949). His real name was Eric Blair; b. in India.

Osler, Sir William, Bt., M.D., F.R.S. (1849–1919), Canadian physician and medical historian; an authority on diseases of the blood and spleen.

Oswald, St., King of Northumbria from 625 to 642, established Christianity amongst his subjects.

Ouida, pseudonym of **Louise de la Ramée** (1839–1908), English novelist of flamboyant personality whose many romantic stories were very popular and included *Under Two Flags*, *A Dog of Flanders*, and *Moths*. Born at Bury St. Edmunds and buried at Bagni di Lucca in Tuscany. Her father was French.

Otto, Nikolaus August (1832–91), German inventor of the four-stroke cycle that bears his name.

Otto the Great (912–973), son of Henry the Fowler, crowned King of the Germans at Aachen in 936 and Emperor at Rome in 962. Overawed the papacy, checked the barbarian invasions, founded the East Mark (Austria), and considerably consolidated Germany.

Ovid (43 B.C.–A.D. 18), the famous Latin poet (Publius Ovidius Naso) whose *Metamorphoses* and *Art of Love* are among the best-known examples of Roman literature of the lighter kind.

Owen, Robert (1771–1858), socialist and philanthropist, devoted his life and fortune to the carrying out of his theories, and established socialistic colonies in Lanarkshire, Hampshire and America.

Pachmann, Vladimir de (1848–1923), Russian pianist, an unrivalled interpreter of the works of Chopin.

Paderewski, Ignace Jan (1860–1941), achieved unrivalled fame as a pianist and for half a century worked for the freedom of his native Poland. He represented his country at Versailles and became her first Prime Minister.

Paganini, Niccolo (1782–1840), Italian violinist and composer whose playing became a legend and brought him much fame and wealth. He ranks as first among virtuosi of the violin.

Paine, Thomas (1737–1809), English revolutionary writer, b. Thetford, Norfolk, son of a Quaker; emigrated to America (1774), becoming famous with the publication of his pamphlet *Common Sense* in favour of American independence. On return to England (1787) wrote *The Rights of Man* in reply to Burke's *Reflections on the Revolution in France*. This was extensively read but his attack on English institutions procured him a trial for sedition and he fled to France. There he wrote *The Age of Reason*, an attack on Christianity which excited great indignation in England. Returned to America where he lived his last years in solitude and ill-health.

Palestrina, Giovanni Pierluigi da (*c.* 1525–94), great Italian composer of unaccompanied church music and madrigals, among whose works are the *Missa Papae Marcelli* and the *Stabat Mater* for 8 voices, which is among the greatest musical glories of all time. *See* **Section E**.

Palgrave, Sir Francis (1788–1861), English historian, best known for his *A History of Normandy and England*. His son, **Francis Turner Palgrave** (1824–97), was Professor of Poetry at Oxford, and edited the famous anthology, *The Golden Treasury*. Another son, **William Gifford Palgrave** (1826–88), was a diplomat and prose writer of ability.

Palissy, Bernard (*circa* 1510–89), a distinguished French potter, who after years of struggle and self-denial discovered the art of producing white enamel, after which he became famous and set up a porcelain factory in Paris, which was patronised by Royalty.

Palladio, Andrea (1518–80), the great Italian architect, who introduced the style of architecture known as Palladian.

Palmer, John (1742–1818), originator of the mail-coach postal service in 1784.

Palmerston, Henry John Temple, 3rd Viscount (1784–1865), English statesman, was long dominant in European affairs because of his vigorous and popular policy. He spent many years of his life in office, serving as Tory Secretary for War from 1808 till 1828 as Foreign Secretary in all the Whig cabinets between 1830 and 1851, and as Prime Minister

in 1855 and from 1859 until his death. He had a lofty conception of the strength and duties of England and was the irreconcilable foe of oppression and injustice.

Pancras, St., the patron saint of children, was the son of a Roman noble, was baptised in Rome in the reign of Diocletian, where he was put to death at the age of fourteen for refusing to renounce Christianity.

Pandit, Vijaya Lakshmi (b. 1900), Gov. of Maharashtra, 1962–64; elected to Lok Sabha, 1964; Indian High Comm. in London, 1954–61. India's first Ambassador to the Soviet Union (1947–9) and to the United States (1949–51), the first woman to be elected Pres. of the U.N. General Assembly (1953–4). Sister of Jawaharlal Nehru.

Panizzi, Sir Anthony, K.C.B. (1797–1879), an Italian political exile, who in 1831 was appointed to the Assistant Librarianship and Keepership of the Printed Books of the British Museum. In 1856 he became Principal Librarian, retiring in 1866. The great Reading Room was constructed from his designs.

Pankhurst, Emmeline (1858–1928) was a prominent and indefatigable worker for women's suffrage, together with her daughters Dame Christabel and Sylvia.

Papin, Denis (1647–1714), a French mathematician and scientist who settled in England. He invented the condensing pump, and was a pioneer in the development of the steam engine. Not being a mechanic, he made all his experiments by means of models.

Paracelsus, Philippus Aureolus (1493–1541), a famous Swiss mystic and alchemist. He made numerous important discoveries, being the first to employ laudanum and antimony in pharmacy. The English translation of his *One Hundred and Fourteen Experiments and Cures* appeared in 1596. His real name was Theophrastus Bombastus von Hohenheim.

Park, Mungo (1771–1806), famous British traveller who in 1799 published an arresting account of his *Travels in the Interior of Africa*.

Parker, Rev. Joseph (1830–1902), a popular Nonconformist preacher and author who built the City Temple, and ministered there up to the time of his death.

Parnell, Charles Stewart (1846–91), the Irish politician, who as leader of the Nationalist Party made it more powerful than it had ever been and successfully enlisted the support of Gladstone for the policy of Home Rule. Accused by *The Times* of complicity in the crimes of the Land League on the basis of letters forged by Richard Pigott, he was completely vindicated by a Royal Commission and awarded heavy damages. Was dropped from the leadership of his party following the O'Shea divorce proceedings and died soon afterwards.

Parry, Rear-Admiral Sir William Edward (1790–1855), an Arctic explorer and naval commander of great distinction, who undertook several expeditions to the Polar regions and made numerous important discoveries.

Parsons, Hon. Sir Charles Algernon, O.M., K.C.B., F.R.S. (1854–1931), was head of the electrical and engineering works of C. A. Parsons and Co., and of the Parsons Marine Steam Turbine Co., Ltd., Newcastle-on-Tyne, and inventor of the steam turbine which has effected a remarkable improvement in the propulsion of war and mercantile vessels.

Partridge, Sir Bernard (1861–1945), began life as a stained glass designer, afterwards worked at book illustrations, and for a time was on the stage. Joined *Punch* staff 1891, and for many years was its principal cartoonist.

Pascal, Blaise (1623–62), celebrated French mathematical genius and religious philosopher whose *Provincial Letters* are one of the world's literary masterpieces. At the age of nineteen he invented an ingenious adding machine and was the first to demonstrate the barometric effects of altitude.

Pasternak, Boris Leonidovich (1890–1960), Russian poet and writer. Translations of his great novel *Dr. Zhivago* appeared in 1958, though it was forbidden in the Soviet Union. In that year he was awarded—though he declined it—the Nobel Prize for Literature "for his important contributions both to contemporary lyric poetry and to the great Russian narrative tradition."

Pasteur, Louis (1822–95), French chemist, whose work was inspired by an interest in the chemistry of life which abided with him until his death. His researches on fermentation led to the science of bacteriology and his investigations into infectious diseases and their prevention to the science of immunology. The pathological bacteriological import of Pasteur's researches came about mainly through his disciples (Lister, Roux, and others) and not directly, though all founded on his early non-medical investigations on organisms of fermentation, etc. which were of great importance in industry, and fundamentally. He spent most of his life as director of scientific studies at the Ecole Normale at Paris, where he was appointed in 1857. The Institut Pasteur was founded in 1888.

Patmore, Coventry (1823–96), poet of the Victorian era, and author of *The Angel in the House*.

Paton, Sir (Joseph) Noel (1821–1901), Scottish painter, sculptor, historical artist, archæologist, and poet.

Patrick, St. (*c.* 387–*c.* 463), the patron saint and Apostle of Ireland, was for many years a great and successful Christian missionary in that country. Few authentic facts about his life are known, but many miraculous stories, such as his alleged extermination of serpents in the island, have been associated with him.

Patti, Adelina Juana Maria (Baroness Cederström) (1843–1919), coloratura soprano, b. in Madrid of Italian parents, unsurpassed for purity of tone and style.

Pattison, Dorothy Wyndlow (1832–78), a sister of Mark Pattison, who devoted a great part of her life to hospital work in Walsall, where, as "Sister Dora," she is revered for her saintly life and devotion to the sick poor.

Pattison, Mark (1813–84), scholar and critic, rector of Lincoln College, Oxford. His wife, **Emilia Francis Strong** (afterwards Lady Dilke), was well known as a French art historian.

Paul VI, Pope (Giovanni Battista Montini) (b. 1897), elected pope in 1963 on the death of John XXIII. Formerly Archbishop of Milan. Made pilgrimage to Holy Land in Jan. 1964.

Pavlov, Prof. Ivan Petrovich (1849–1936), an eminent Russian physiologist: Director of the Physiological Institute. Foreign member of the Royal Society and Nobel Prize-winner.

Pavlova, Anna (1885–1931), one of the greatest exponents of the Russian school of dancing.

Peabody, George (1795–1869), an American merchant who lived for the greater part of his life in London, and, acquiring a large fortune, bequeathed immense sums for philanthropic purposes in England and the United States.

Peacock, Thomas Love (1785–1866), English satirist, whose novels include *Headlong Hall* and *Nightmare Abbey*, and who ranks high in English literature for the wit and grace of his style.

Pearson, Sir Cyril Arthur, Bt. (1866–1921), journalist and newspaper proprietor, who founded *Pearson's Weekly*, *The Daily Express*, and other publications. Retired because of blindness and devoted himself to the welfare of the blind particularly ex-servicemen: founder of St. Dunstan's.

Pearson, Lester Bowles, O.B.E., M.A. (b. 1897), Prime Min. of Canada, 1963–; Min. for External Affairs, 1948–57.

Peary, Rear-Admiral Robert Edwin (1856–1920), an American Arctic explorer who in 1891–92, conducted a sledging expedition towards the Pole. In 1893, 1895, and 1898 was again in the Arctic regions; and in 1900–02 reached the highest latitude hitherto attained. In the spring of 1906 he touched 87 degs. 6 min. N. latitude. On April 6, 1909, making the journey by sledge over sea-ice and accompanied by only his native servant, he succeeded in reaching the Pole.

Peel, Rt. Hon. Sir Robert, 2nd Bt. (1788–1850), a prominent British statesman who entered Parliament at twenty-one years of age, and immediately exhibited great capacity, being appointed Under-Secretary for the Colonies in the following year. From 1812 to 1818 he was Secretary for Ireland; and in 1822 he became Home Secretary, introducing, whilst fulfilling that office, the new police service associated with his name. In 1834, Peel was for four months Prime Minister, and in 1841 formed a second ministry. It was then that the Anti-Corn Law agitation became

formidable, and Peel abandoned his former Protectionist attitude, and carried his Repeal measure in 1846. He was thrown from his horse in Hyde Park and died from injuries.

Penfield, Wilder Graves, O.M., M.D., M.A., D.Sc., F.R.S. (b. 1891), Canadian brain surgeon; Dir. Montreal Neurological Institute; Prof. of Neurosurgery McGill Univ.; Pub. *The Cerebral Cortex of Man* (1950), *Epilepsy and the Functional Anatomy of the Human Brain* (1954).

Penn, William (1644–1718), became a Quaker, and wrote some powerful pamphlets supporting his new faith. He devoted himself to good works, and in 1682, having obtained a special grant from King Charles II., went to America and founded Pennsylvania.

Penney, William George, Baron, K.B.E., M.A., Ph.D., D.Sc., F.R.S. (b. 1909), British scientist; Chair. U.K. Atomic Energy Authority, 1964–7. After 23 years in atomic research and development, returned to academic life in 1967 to become Rector of Imperial College. His nuclear research team at AEA developed the advanced gas-cooled reactor (AGR) chosen for the new power stations to be built at Dungeness and Hinckley Point.

Pepys, Samuel, F.R.S. (1633–1703), naval administrator, sometimes called the "Father of the British Civil Service." The *Diary* was written while he was a comparatively young man and is a unique revelation of a man and his age, besides including eye-witness descriptions of the Great Plague and Fire of London.

Pergolesi, Giovanni Battista (1710–36), Italian composer, best known for his humorous opera *La Serva Padrona* and his *Stabat Mater*.

Pericles (c. 490–429 B.C.), the distinguished Athenian statesman, general, and orator, who raised Athens to the point of its fullest prosperity.

Perkin, Sir William Henry, F.R.S., D.Sc. (1838–1907), great organic chemist and famous for his discovery of mauve, the first synthetic dye.

Perkin, William Henry (junior) (1860–1929), foremost organic chemist of his day; Professor of Organic Chemistry at Manchester University, 1892–1912 and later at Oxford. His researches led to important industrial results.

Perrin, Francis (b. 1901), French scientist and socialist; succeeded Joliot-Curie as High Commr. for Atomic Energy in 1951. Prof. Atomic Physics, Collège de France, 1946– .

Persius Flaccus, Aulus (A.D. 34–62), a famous Stoic philosopher.

Perugino, Pietro (1446–1524), Italian artist who excelled in religious subjects and painted many fine frescoes including some in the Sistine Chapel at Rome. Raphael was his pupil.

Pestalozzi, Johann Heinrich (1746–1827), Swiss educational reformer whose theories laid the foundation of modern primary education. His teaching methods were far in advance of his time, but are now employed with outstanding success in schools in many parts of the world.

Pétain, Marshal Henri Phillipe (1856–1951), became a French national hero after the successful defence of Verdun in 1916 and was made C.-in-C. of all the French armies. In 1940 he became Prime Minister, signed an armistice with Germany, and set up a quasi-independent administration at Vichy. In 1945 he was sentenced to death for treason, the sentence being commuted to life imprisonment.

Peter I, called The Great (1672–1725). Czar of Russia, showed great ability and energy of character, devoting himself largely to the reorganisation of his army and navy. He spent some months at Deptford studying shipbuilding. He founded St. Petersburg (1703), which was his "window on to Europe," and gained control in the war with Sweden of Karelia, Ingermanland, and Livonia. Among the prisoners taken by him at the Battle of Poltava (1709) was Catherine Skavronsky, daughter of a Lithuanian peasant, whom he later married. By her care and understanding she did much to strengthen his power. Peter died without naming an heir, and Catherine became Empress of Russia (1725–27).

Peter, the Hermit (c. 1050–1115), was the main instrument of the agitation which brought about the first Crusade. He was a French monk, of great eloquence and earnestness, and lived to see Jerusalem in the hands of the Christians.

Petrarch, Francesco (1304–74), Italian poet and scholar, whose odes and sonnets *To Laura* are unmatched for their lyrical beauty and passion.

Petrie, Sir (William Matthew) Flinders, F.R.S. (1853–1942), British egyptologist; carried out excavations in Britain (1875–90), Egypt (1880–1924), and Palestine (1927–38); Prof. of Egyptology at University College, London, 1893–1935.

Phidias, the greatest of Greek sculptors, flourished from about 500 to 432 B.C., was specially famous for his work in gold, ivory and bronze. Nothing now remains to attest his genius although the sculptures in the British Museum, widely known as the Elgin Marbles, may have been from his designs.

Philip II. of France (1180–1223), was a prominent figure in the third Crusade, in which for a time he associated himself with our Richard I. Victor over a strong coalition at the momentous battle of Bouvines in 1214.

Philip II. of Macedonia (382–336 B.C.), trained in military arts in Greece, when he came to the throne instilled martial ideas into his subjects, and entered upon a career of conquest that did not end until he had become master of Greece. Father of Alexander the Great.

Philip II. of Spain (1527–98), succeeded his father the Emperor Charles V. in half his dominions. The Revolt of the Netherlands, the annexation of Portugal in 1580, and the unsuccessful attempt to subdue England by the Armada, were outstanding events of his troubled reign. He was a devout Roman Catholic, strongly supported the Counter-Reformation, built the strange Escorial, and was four times married, his second wife being Mary Tudor.

Philip V. of Spain (1683–1746), founded the Bourbon dynasty in Spain, and was the son of the Dauphin of Louis XIV. and Maria Theresa of Spain. His uncle, Charles II. of Spain, bequeathed the kingdom to him, and this led to the war of the Spanish Succession, which ultimately confirmed him in his kingship.

Phillip, Arthur (1738–1814), first governor of New South Wales. Under his command the first fleet of 717 convicts set sail from Britain to Australia, and with the founding of Sydney in 1788 colonisation of the whole country began.

Phillips, Stephen (1868–1915), dramatist and poet of distinction. Wrote popular verse dramas, including *Paolo and Francesca*, *Herod*, and *Ulysses*.

Piasts, first Polish dynasty in Poland until 14th century and until 17th century in Silesia.

Piazzi, Giuseppe (1746–1826), an Italian astronomer. He was the discoverer of the planet Ceres, the first known of the asteroids.

Picasso, Pablo Ruiz (b. 1881), Spanish painter; received his early training in Catalonia and settled in Paris in 1903. He and Braque were the originators of Cubism (c. 1909). His influence over contemporary art is comparable with that exercised by Cézanne (*q.v.*) over the artists of his time. Perhaps the best known single work is his mural *Guernica*, painted at the time of the Spanish civil war, expressing the artist's loathing of fascism and the horrors of war. His genius has also found scope in sculpture, ceramics, and the graphic arts, and he has designed décor costumes for the ballet.

Piccard, Auguste (1884–1962), Swiss physicist, noted for his balloon ascents in the stratosphere, and his submarine research. In 1960 his son, Jacques Piccard, made a descent of over 7 miles in the Marianas trench in the western Pacific in a bathyscaphe designed and built by him.

Pickford, Mary (b. 1893), was the leading film actress of the silent days and affectionately known as "the world's sweetheart."

Pilsudski, Joseph (1867–1935), Polish soldier and statesman. Led unsuccessful Polish attack on Russia in 1920 seeking the restoration of the 1772 frontiers. Exercised military dictatorship from 1926 until his death.

Pindar (522–443 B.C.), the eminent lyric poet of ancient Greece.

Pinero, Sir Arthur Wing (1855–1934), was an able English dramatist and former actor, of Portuguese descent. *Dandy Dick*, *The Second Mrs. Tanqueray* and *Mid-Channel* are among his plays.

Pirandello, Luigi (1867–1936), Italian dramatist and novelist. Awarded Nobel Prize for Literature, 1934.

Pissarro, Camille (1830–1903), French Impressionist painter of landscapes; studied under Corot.

Pitman, Sir Isaac (1813–97), founded the Pitman system of phonographic shorthand.

Pitt, William (1759–1806), was the second son of the Earl of Chatham. Entered Parliament at twenty-one, and by his brilliant oratory captivated the House of Commons. In 1782, when only twenty-three, he became Chancellor of the Exchequer, and in the following year was made Premier, and held that office for seventeen years, through the trying period of the French Revolution, when war with France was almost continuous. He was undoubtedly one of the most brilliant statesmen that England has produced, and his death at the early age of forty-six was a great loss to the country. He was buried in Westminster Abbey.

Pius XII. (1876–1958), elected Pope, March 2, 1939. As Cardinal Eugenio Pacelli, he was Papal Secretary of State, 1930–39, and was outspoken in his condemnation of communism. Before he became a Cardinal he was for many years Papal Nuncio in Germany. He was a brilliant diplomat but has been criticised for his failure to protest publicly against the crimes of the Nazi regime.

Pizarro, Francisco (*c.* 1478–1541), was an adventurous Spaniard who, after Columbus's discoveries in the New World, set out for South America, overthrowing the Inca empire and conquering Peru for the Emperor Charles V.

Planck, Prof. Dr. Max (1858–1947), German physicist, whose investigations into radiation of energy culminated in 1901 in his law of radiation, which laid the foundation of the quantum theory. Awarded Nobel Prize for Physics, 1918.

Plato (427–347 B.C.), great Athenian philosopher, pupil of Socrates, teacher of Aristotle. He founded a school at Athens under the name of the Academy, where he taught philosophy and mathematics. His great work is his *Dialogues*, which includes the *Republic*, the longest and most celebrated of them all. All Plato's known writings have come down to us, and they constitute one of the most influential bodies of work in history.

Playfair, Lyon (1818–98), a far-sighted Victorian who stood for the greater recognition of science in national life. He forsook his profession as professor of chemistry at Edinburgh to enter Parliament. Pres. of the British Association in 1885.

Plimsoll, Samuel (1824–98), was a native of Bristol, and while M.P. for Derby got up an agitation on behalf of merchant sailors, procuring the passing of the Merchant Shipping Act of 1876, which by defining a line above which no ship must sink in the water when loaded has ever since made the overloading of ships illegal. The line is known as the Plimsoll Mark.

Pliny the Elder (A.D. 23–79), Roman naturalist who dedicated his great work *Natural History* to the Emperor Titus. He died of fumes and exhaustion while investigating the eruption of Vesuvius. His nephew, **Pliny the Younger** (A.D. 62–113), achieved renown with his series of historical *Letters*.

Plotinus (*c.* 204–270), Greek philosopher, was the founder of Neoplatonism, which had considerable influence on early Christian thought.

Plutarch (*c.* 46–120), a pagan Hellenic writer, a contemporary of the authors of the two gospels according to St. Matthew and St. Luke. His *Lives of Agis and Cleomenes* form one of the world's most famous literary productions.

Poe, Edgar Allan (1809–49), was an American poet of unique genius, author of "The Raven," "The Bells," "Annabel Lee," and other poems of haunting melody and dainty fancy. Poe's *Tales of Mystery* are thrilling examples of their class.

Poincaré, Raymond Nicolas Landry (1860–1934), was President of France from 1913 to 1920 and won the confidence and admiration of the French people and their Allies by his services during the first world war. He was Prime Minister in 1912, 1922–24, and 1926–29.

Pole, Reginald (1550–58), archbishop of Canterbury (1556–58), cardinal of the Roman Church, antagonist of the English reformation, whose mother was Margaret Plantagenet, half-sister of Henry VII's mother. His difference with Henry VIII over the divorce of Catherine evoked his famous treatise *De Unitate Ecclesiastica*, a defence of papal supremacy and a denunciation of the king. His activity brought about his own attainder, and the execution of his brother and mother as participators in his treasonable designs.

Pollard, Professor Albert Frederick, F.B.A. (1869–1948), English historian and first director of the Institute of Historical Research; author of many authoritative works on the Tudor period.

Polo, Marco (1256–1323), the famous Venetian traveller and explorer, who made journeys through China, India, and other eastern countries, and published the record of his various wanderings, recounting the many wonders and marvels he had seen—a record which seemed for the most part beyond credence to his contemporaries, but now largely confirmed.

Pompadour, Jeanne Antoine Poisson, Marquise de, (1721–64), was for a long time the favourite of Louis XV. of France, over whom she exercised great influence.

Pompey the Great (106–48 B.C.), distinguished himself as a general while young, clearing the Mediterranean of pirates, and ultimately became, with Caesar and Crassus, triumvir.

Pope, Alexander (1688–1744), the celebrated 18th century poet and translator of *Homer*. Author of *The Rape of the Lock*, *Essay on Criticism*, and *Essay on Man*.

Pound, Ezra Loomis (b. 1885). American poet and scholar, famous both for the beauty of his individual verse and for his excellent translations of Provencal, Latin, Chinese, French and Italian poets.

Poussin, Nicolas (1593–1665), an eminent French painter patronised by Louis XIII.

Powys, John Cowper (1872–1963), English writer, best known for his novel *Wolf Solent* (1929) and his essays *The Meaning of Culture* (1929) and *A Philosophy of Solitude* (1933). His brothers, Theodore Francis Powys (1875–1953) and Llewelyn Powys (1884–1939), were also writers of originality.

Prasad, Dr. Rajendra (1884–1963), first President of the Indian Union, 1950–62.

Praxiteles, a great Greek sculptor who lived in the 4th century B.C.

Preece, Sir William Henry, K.C.B., F.R.S. (1834–1913), a Welsh electrician, connected with the Electric Telegraph Service from 1853, and conspicuously successful in his experiments which led to the later developments in telegraphy. He was associated with Marconi in his wireless-telegraphic schemes and introduced the block system into England.

Prescott, William Hickling (1796–1859), one of the best known of American historians.

Prichard, James Cowles, M.D., F.R.S. (1786–1848) British ethnologist and physician, whose knowledge of anatomy, psychology, and languages enabled him to pave the way for anthropological research in England.

Priestley, John Boynton, M.A. (b. 1894), critic, novelist, essayist, playwright and broadcaster, whose work has received great praise and includes the novels *The Good Companions*, *Angel Pavement*, the plays *Dangerous Corner*, *Time and the Conways*, *The Linden Tree*, and a literary history, *Literature and Western Man* (1960).

Priestley, Joseph, F.R.S. (1733–1804), was the discoverer of oxygen and other gases, and wrote *A History of Electricity*. He was also a great advocate of freedom and progress. Biography: *Adventurer in Science and Champion of Truth* by F. W. Gibbs (1965).

Priestley, Sir Raymond, M.A., D.Sc. (b. 1886), geologist. Took part in the Shackleton Antarctic Expedition of 1907–9 and Scott's Antarctic Expedition 1910–13. President of the British Association, 1956.

Prior, Matthew (1664–1721), a well-known poet and wit who acquired celebrity by writing *The City Mouse and Country Mouse*.

Prokofiev, Sergey Sergeyevich (1891–1953), celebrated Russian composer, whose music has a strong folk-song element, rich in melody and invention. He has written operas: *The Love of Three Oranges*, *The Betrothal in a Nunnery*, *War and Peace*, ballets: *Romeo and Juliet*, *Cinderella*, symphonies, chamber music and the music for Eisenstein's films *Alexander Nevsky*, *Ivan the Terrible*, etc. *See* Section E.

Protagoras (*c.* 480–411 B.C.), a Greek philosopher, chief of the Sophists, famous for his scepticism and disbelief in objective truth.

Proudhon, Pierre Joseph (1809–65). French political economist.

Proust, Marcel (1871–1922). French psychological novelist; author of a series of 15 novels known under the title of *A la recherche du temps perdu*. Proust's works have been admirably translated into English by C. K. Scott Moncrieff. Biography by George D. Painter. *See* M4.

Prudhon, Pierre Paul (1758–1823), a French historical and portrait painter.

Ptolemy, Claudius Ptolemaeus, a famous astronomer and geographer of Alexandria, who flourished from *c*. A.D. 90–168. He founded the Ptolemaic system, which taught that the earth was stationary and the heavenly bodies revolved around it. His great works are the *Almagest* and his *Geographical Outline*.

Puccini, Giacomo (1858–1924). Italian composer whose operas met with great success and include *Manon Lescaut*, *La Bohème*, *La Tosca*, *Madam Butterfly*, and *Turandot* (finished after his death).

Purcell, Henry (1658–95), one of the great figures in English music; organist of the Chapel Royal and composer to Charles II. Anthems form the greater part of his sacred music, and he wrote not only for the Court but for the stage. *See* Section E.

Pusey, Edward Bouverie (1800–82), a famous Anglican cleric; he published *Tracts for the Times*, which inaugurated the Tractarian movement that developed into what became known as Puseyism.

Pushkin, Alexander (1799–1837), the national poet of Russia, several times exiled for his liberal views and held in high honour by contemporary Russia. Died of wounds received in a duel. His poetical tales are full of dramatic power. *Eugene Onegin* and *Boris Godunov* are considered masterpieces.

Pym, John (1584–1643), a prominent statesman in the reign of Charles I. A leader of the Puritan opposition in Parliament.

Pythagoras (*c*. 582–*c*. 507 B.C.), most influential of the early Greek scientists. He was born on the island of Samos, off the Turkish mainland, which he left *c*. 530 to settle at Croton, a Greek city in southern Italy. He was a mystic and mathematician and believed in the transmigration of souls. He died in exile.

Q

Quaritch, Bernard (1819–99), a famous dealer in rare books, who was a native of Germany but settled in London, and became naturalised in 1847. His knowledge of scarce and valuable books was unique. His shop in Piccadilly was a storehouse of literary treasures.

Quasimodo, Salvatore (b. 1901), Italian poet whose greatness lies in his humanity and his rejection of the Fascist influence. He won the Nobel Prize for Literature in 1959.

Quiller-Couch, Sir Arthur Thomas (1863–1944), was a well-known novelist and essayist, who as "Q" published many delightful stories, including *Dead Man's Rock*, *Troy Town*, and *The Splendid Spur*. Edited the *Oxford Book of English Verse*. Professor of English Literature, Cambridge University, 1912–44.

R

Rabelais, François (*c*. 1495–1553), the great French satirist, first adopted the career of a monk, then studied medicine, and settled at Lyons as a doctor, and it was there that he published his *Gargantua and Pantagruel*, among the wittiest though coarsest books in any language.

Rachel, Mlle (stage name of Elizabeth Félix) (1821–58), acknowledged as the greatest tragic actress of her time and reached the height of her fame in Racine's *Phèdre* in 1843.

Rachmaninov, Sergey Vasilyevich (1873–1943). Russian pianist, composer, and conductor. He wrote operas, symphonies, piano concertos, piano pieces, and songs, and was one of the greatest pianists of his age. After the Russian revolution he made his home in America, where he died. *See* Section E.

Racine, Jean (1639–99), French tragic poet whose great dramas include *Andromaque*, *Iphigenie* and *Phèdre*. Left an orphan at an early age he was brought up by his paternal grandparents who sent him to the famous school of Port-Royal where he acquired his love of the classics. He enjoyed favour at the court of Louis XIV and along with his friend Boileau was joint historiographer to the king. Mme de Maintenon persuaded him to write *Esther* and *Athalie* two other masterpieces of French literature.

Rackham, Arthur, R. W. S. (1867–1939), a noted English artist who excelled in the illustration of books such as *Peter Pan*, *Alice in Wonderland*, Wagner's *Ring Librettos*, *Mother Goose*, Grimm's and Andersen's *Fairy Tales*.

Radhakrishnan, Sir Sarvepalli, O.M., M.A., D.Litt. (b. 1888). Pres. Indian Union, 1962–7; Vice-Pres., 1952–62; formerly Spalding Professor of Eastern Religions and Ethics at Oxford.

Raeburn, Sir Henry, R.A. (1756–1823), was a famous Scottish portrait painter, and friend and pupil of Sir Joshua Reynolds.

Raffles, Sir Thomas Stamford (1781–1826), an eminent naturalist. He was the founder and first President of the Zoological Society of London. Founded Singapore, 1819.

Raikes, Robert (1735–1811), a practical propounder of the Sunday School system.

Raleigh, Sir Walter (1552–1618), a scholar, courtier, soldier, sailor and statesman. In 1584 Queen Elizabeth granted him a patent for the discovery and settlement of unknown countries in the far West. The colonisation of Virginia followed. At one time he was in great favour at Court, but quarrelled with the Queen, and suffered in fortune in consequence. When James I. came to the throne, Raleigh was supposed to be implicated in a conspiracy against that monarch, and was sentenced to death. After that he was a prisoner in the Tower of London for twelve years, and there he wrote his *History of the World*, and other works. In 1615 James set him at liberty in order to head an expedition to Guiana in the hope of finding gold, but being unsuccessful he was again imprisoned on his return, and finally beheaded in Old Palace Yard.

Raman, Sir (Chandrasekhara) Venkata, F.R.S. (b. 1888), Indian physicist whose main work has been in spectroscopy. For his research on the diffusion of light and for the discovery of the "Raman Effect" he was awarded the 1930 Nobel Prize in Physics.

Rameau, Jean Philippe (1683–1764), French composer and church organist whose works on musical theory profoundly influenced musical development in the 18th century.

Ramón y Cajal, Santiago (1852–1934), Spanish histologist who made many discoveries in the structure of the nervous system. Nobel Prizeman, 1906.

Ramsay, Sir William, K.C.B., F.R.S. (1852–1916), chemist and discoverer with Lord Rayleigh of argon. Later he discovered helium and detected other inert gases, which he called neon, krypton, and xenon. With F. Soddy carried out research on radium emanation. Awarded Nobel Prize in Chemistry, 1904. President of the British Association, 1911.

Ramsey, Most Rev. Arthur Michael, D.D. (b. 1904), Archbishop of Canterbury, 1961. Archbishop of York, 1956–61; Prof. of Divinity at Cambridge, 1950–52; Lord Bishop of Durham, 1952–56.

Ranke, Leopold von (1795–1886), the painstaking and thorough German historian who laid the basis of modern historical research and demonstrated many of its methods.

Raphael Santi (1483–1520), the distinguished Italian painter whose works excel all others in their beauty of expression and inspired treatment. He lived a considerable period in Rome, where he painted his famous frescoes for the Vatican and St. Peter's and also the celebrated cartoons designed for the tapestries of the Papal chapel, which afterwards were brought to England, and are now at the Victoria and Albert Museum. His last painting was *The Transfiguration*.

Rasputin, Grigori Yefimovich (1871–1916), a "holy man" of the old Russia who lived quietly in his native village until 1904, when he became notorious for his extravagant teachings, which gave him a Messianic-like position. He was a debauchee and advocated sin in order to obtain repentance and salvation. In 1907 he was pre-

sented to the Court where he soon became all-powerful. A seeming miracle which improved the health of the Tsarevich Alexis increased his influence with the Tsar and Tsaritsa. Assassinated by a group of conspirators from the nobility.

Rathbone, Eleanor (1872–1946), social reformer, humanitarian, and independent politician. Championed widows' pensions and family allowances and laboured for political refugees, particularly children.

Ravel, Maurice (1875–1937), French composer, pupil of Fauré, one of the leaders of the impressionist movement. He wrote chiefly chamber music, piano pieces, songs, and ballet music, including *Daphnis et Chloé*, specially commissioned by Diaghilev. *See* Section E.

Raven-Hill, Leonard (1867–1942), English artist and cartoonist, was well known for his drawings and cartoons in *Punch*, 1896–1935.

Rawlinson, Sir Henry Creswicke, Bt., G.C.B., F.R.S. (1810–95), diplomat, soldier and orientalist. For a number of years he superintended explorations in Assyria and Babylon, accumulating a valuable collection of antiquities now in the British Museum.

Ray, John (1627–1705), an English naturalist, famous for his contributions to the science of botany. He has been called the "father" of English natural history.

Rayleigh, 3rd Baron, O.M., F.R.S. (1842–1919), one of the most eminent of British physicists; an authority on sound vibrations, and the co-discoverer with Sir William Ramsay of argon. In 1904 was awarded the Nobel Prize for physics.

Read, Sir Herbert, Kt., D.S.O., M.C. (b. 1893), English poet and critic. He was assistant keeper at the Victoria and Albert Museum (1922–31), professor of fine art at Edinburgh (1931–33), and edited the Burlington Magazine (1933–39). His writings include *Poems 1914–1934*, *In Retreat*, *Reason and Romanticism*, *Education through Art*, *The Meaning of Art*.

Reade, Charles (1814–84), holds high rank amongst the Victorian novelists. His first story, *Peg Woffington*, was published in 1852. *It's Never too Late to Mend*, *Griffith Gaunt*, and *The Cloister and the Hearth* are his best-known novels.

Réaumur, René Antoine Ferchault de (1683–1757), an eminent French chemist, who invented the temperature scale which bears his name.

Récamier, Madame Jeanne Françoise Julie Adélaide Bernard (1777–1849), a noted society woman of the days of Napoleon.

Reeves, (John) Sims (1818–1900), was the most celebrated English tenor of his time.

Regnault, Henri Victor (1810–78), a French scientist who made highly successful experiments in regard to the physical properties of bodies and their relation to heat.

Regnault, Jean Baptiste, Baron (1754–1829), a talented French genre painter.

Reith, John Charles Walsham, 1st Baron (b. 1889), British civil engineer, the first Director-General of the British Broadcasting Corporation, 1927–38. Recognised as a man of great organising ability, he has served successively as Chairman of Imperial Airways (1938–39), Chairman of B.O.A.C. (1939–40), Min. of Information (Jan.–May 1940), Min. of Transport (May–Oct. 1940), Min. of Works and Buildings (Oct. 1940–Feb. 1942), Dir. of the Admiralty's Combined Operations Material Dept. (1943–45), Chairman Commonwealth Telecommunications Conference (1945), Chairman Commonwealth Communications Council (1946), and Chairman Colonial Development Corporation, 1950–59.

Rembrandt, Harmens van Rijn (1606–69), one of the greatest of the Dutch school of painters who produced many remarkably successful portraits, as well as numerous figure subjects, all of them distinguished by their masterly qualities. He was an etcher of high ability also, and a number of his works are in the British national collections.

Renan, Ernest (1823–92), a noted French author who wrote upon religious subjects, and won special fame by his *Life of Jesus*, published 1863.

Reni, Guido. (*See* Guido Reni.)

Rennie, John, F.R.S. (1761–1821), a Scottish civil engineer. He was the constructor of the Waterloo and Southwark and new London bridges over the Thames, the London Docks, the East and West India Docks, the Plymouth breakwater, and many other works at Liverpool, Leith, Dublin, Hull, and elsewhere.

Renoir, Auguste (1841–1919), great French artist of the Impressionist school, whose vision was carefree and romantic. Some of his greatest achievements were in still-life and landscape. *La Loge*, *Les Parapluies*, *La Première Sortie* are famous pictures.

Reuter, Baron Paul Julius de (1821–99), was the pioneer of telegraphic press services.

Reymont, Vladislav Stanislav (1868–1925), Polish novelist; Nobel Prize 1924 (*The Peasants*).

Reynolds, Sir Joshua, P.R.A. (1723–92), was the first President of the R.A. from 1768 till his death, and the most fashionable portrait painter of his time. He was born at Plympton in Devon, son of the master of the grammar school there.

Rhodes, Rt. Hon. Cecil John (1853–1902), born at Bishop's Stortford. Went to South Africa in 1871, entered upon a diamond-mining enterprise at Kimberley, and acquired a considerable fortune. Was a member of the Cape Legislature in 1881, and became Premier in 1890. He was at the head of the British South Africa Chartered Company, for which a vast amount of territory was annexed, the holding obtaining the name of Rhodesia. Mr. Rhodes was Cape Premier again in 1896; then followed the Jameson Raid and his retirement from political life. During the Boer War he was detained in Kimberley and did not live to see the campaign closed. He left the bulk of his fortune for the founding of scholarships at Oxford.

Ricardo, David (1772–1823), a celebrated English political economist of Hebrew descent, whose *Principles of Political Economy* gained him a high place among the exponents of the science.

Richard I. (1157–99) was King of England from 1189 to his death. He laid heavy burdens upon the people in order to equip an army for the third Crusade. At first he was victorious and did such valiant deeds that he received the name of "Cœur de Lion." Being ultimately defeated, he signed a truce with Saladin, and on his way back to England was shipwrecked. Disguised as a pilgrim, he was identified in Austria, and handed over to the Emperor of Germany, who imprisoned him in a remote castle. A large sum was demanded and paid for his ransom, and after over a year of durance he returned to England, and was crowned at Winchester. Later he was engaged in a war with France, and was mortally wounded by a bolt from a crossbow while besieging the castle of Chaluz in the province of Limousin.

Richard II. (1367–1400), son of the "Black Prince," succeeded his grandfather, Edward III., in 1377, when but ten years old, a Regency being appointed during his minority. In the Wat Tyler rising of 1381 the King confronted the rioters and promised them redress, an undertaking which he did not fulfil. For a time he was greatly under the influence of his uncle, Thomas, Duke of Gloucester, but on coming of age dismissed him, and ruled with some approach to dignity for the next seven years. After 1396 he developed a highly tyrannical disposition and banished or put to death many of the leading statesmen. The opposition against him came to a head in 1399, when Bolingbroke defeated him, and he was made prisoner and died—probably by starvation—in Pontefract Castle.

Richard III. (1452–85), last Plantagenet king of England who took the throne on the death of his brother Edward IV. in 1483, probably murdering his two younger nephews in the Tower. This led to a rebellion in favour of the Earl of Richmond (later Henry VII.) and he was slain on Bosworth Field. His character has been the subject of dissension among historians but there is no doubt that despite his unscrupulousness (not uncommon in those days) he was a brave soldier and able administrator.

Richards, Sir Gordon (b. 1904), British jockey who had one of the most successful riding records in the history of the British Turf: 21,834 mounts, 4870 winners, including the Derby (1953). Retired, 1954.

Richardson, Sir Albert Edward, K.C.V.O., P.R.A., F.S.A., F.R.I.B.A. (1890–1964), British architect and Pres. of the Royal Academy, 1954–56.

Richardson, Henry Handel, pseudonym of Henrietta Richardson Robertson (1870–1946), Aus-

tralian novelist whose major work, outstanding in Australian fiction, is the trilogy *The Fortunes of Richard Mahony*.

Richardson, Sir Owen Williams, D.Sc., F.R.S. (1879–1959), distinguished English physicist. Awarded Nobel Prize in 1928 for his researches on the emission of electricity from hot bodies.

Richardson, Sir Ralph David (b. 1902), actor who has made many appearances on stage, screen, and radio.

Richardson, Samuel (1689–1761), author of *Pamela*, *Clarissa*, and *The History of Sir Charles Grandison*, exercised considerable influence on the development of the novel in England.

Richelieu, Armand Jean du Plessis, Cardinal Duc de (1585–1642), the eminent French ecclesiast and statesman, who was Minister to Louis XIII for eighteen years. He was practically Master of France during the best part of this Cardinalate.

Ridley, Nicholas (1500–55), was Bishop of Rochester in 1547 and Bishop of London in 1550. He took an active part in the Reformation. He was burned at the stake along with Latimer.

Rienzi, Cola di (1313–54), a Roman patriot of humble birth who inflamed the people against their rulers, and aroused such enthusiasm that they proclaimed him "Tribune." During the seven months that he was permitted to exercise supreme power, he proved himself the true friend of the poor. Later murdered in a popular uprising.

Rilke, Rainer Maria (1872–1926), German lyric poet, born in Prague. His work, marked by great beauty of style, culminated in the *Duineser Elegien* and *Sonette an Orpheus*.

Rimbaud, Jean Nicolas Arthur (1854–91), French poet of great originality and friend of Paul Verlaine. All his poems were written between his sixteenth and nineteenth years.

Rimsky-Korsakov, Nikolai Andreyevich (1844–1908), Russian composer whose works include the operas *The Maid of Pskov* (also known as *Ivan the Terrible*), *The Snow Maiden*, *Le Coq d'Or*, and the symphonic suite *Scheherezade*. He was a brilliant orchestrator and rescored many works, including Borodin's *Prince Igor*.

Rizzio, David (c. 1540–66), was the Italian secretary of Mary Queen of Scots and an accomplished musician. Suspected of a too great attachment to Mary, he was murdered by Darnley and his friends in the Queen's presence in the Palace of Holyrood.

Robbia, Luca Della (1400–1482), a famous Florentine sculptor. He was the introducer of enamelled terra-cotta work.

Robens, Rt. Hon. Alfred, Baron (b. 1910), Chairman, National Coal Board, 1961– ; Parl. Sec. Min. of Fuel and Power, 1947–51; Min. of Labour and National Service, 1951.

Roberts, Field-Marshal Earl, V.C., K.G., P.C., K.P., G.C.B., O.M., G.C.S.I., G.C.I.E. (1832–1914), the distinguished soldier, first saw service in the Indian Mutiny, when he won the V.C. In 1880 during the Afghanistan campaign made his historic march from Kabul to Kandahar where he won a complete victory. After serving as C.-in-C., India, 1885–93, and as C.-in-C., Ireland, 1895–99, took over in South Africa in December, 1899, and entirely reversed the unhappy military situation before handing over to Kitchener a year later. C.-in-C. from 1901 until the office was abolished in 1904, and was latterly an ardent advocate of conscription.

Robertson, Sir Charles Grant, C.V.O. (1869–1948), English historian who was Vice-Chancellor of Birmingham University, 1927–38, and Principal 1920–38. His works include *The Rise of the English Nation* 1895, *England under the Hanoverians*, 1911, and *Bismarck*, 1918.

Robertson, Field-Marshal Sir William, Bt., G.C.B., G.C.M.G., G.C.V.O., D.S.O. (1860–1933), the only British soldier to rise from Private to Field-Marshal, served as C.I.G.S., 1915–18. His son, **Brian Hubert, Lord Robertson**, G.C.B. (b. 1892), has had a distinguished military career and was Chairman of the British Transport Commission, 1953–61.

Robeson, Paul Le Roy (b. 1898), the famous Negro singer and actor, who through his singing of spirituals has increased our knowledge and understanding of the Negro. Was a great success in London in 1930 playing *Othello*.

Robespierre, Maximilien François Marie Isidoire de (1758–94), was a country advocate until the outbreak of the French Revolution, when he went to Paris, became an enthusiastic leader of the Jacobin Party, and was made a Member of the Assembly. In the Reign of Terror as President of the Committee of Public Safety he sent vast numbers to the guillotine. Then a counter-movement was set on foot and he was denounced in the Assembly, and, trying to escape, was shot and subsequently guillotined.

Robey, Sir George, C.B.E. (**George Edward Wade**), (1869–1954), famous British comedian of the music-hall.

Robinson, William Heath (1872–1944), English book illustrator, but especially known for the fantastically comic designs of his cartoons and stage scenery.

Rob Roy (the traditional nickname of **Robert McGregor**) (1671–1734), a noted Highland outlaw who levied blackmail on the farmers and rich people of the country-side in return for certain protective services. He belonged to the clan McGregor.

Robsart, Amy (1532–1560), daughter of Sir John Robsart, and wife of Robert Dudley, afterwards Earl of Leicester. While living in seclusion at Cumnor Place under the charge of Anthony Forster, she met her death either by accident or foul play, by the latter according to common belief, Elizabeth's favourite having reason to wish her out of the way. She was discovered dead at the bottom of an old staircase.

Rockefeller, John Davison (1839–1937) was said to be the richest man in the world. Was born on a small farm in New York State, and there worked until sixteen. Migrated to Cleveland, and found employment in an office for a few years. About this time the oil trade was in a disorganised condition, owing to the reckless trading and crude methods of refining. Rockefeller saw what was wrong, and resolved upon trying to remedy it. Later he began oil-refining, and entered into the business with such vigour of purpose, and made so many improvements, that he became a millionaire in a very few years. From the exertions of himself and associates grew the Standard Oil Trust, beginning with a capital of £200,000 in 1870, and extending at such a rate that in 1892 the capital had reached twenty-two millions sterling. During his life-time he gave some 750 million dollars to education and charity.

Rodin, Auguste (1841–1917), the most celebrated French sculptor of recent days, who possessed a bold and original genius. His numerous statues and his fine historic monuments, especially that for Calais commemorating the bravery of Eustache de Saint-Pierre, brought Rodin well-deserved fame.

Rodney, 1st Baron, K.B. (1719–92), a famous English admiral who, having gained numerous victories routed the French fleet under the Comte de Grasse, whom he took prisoner, the result of this crowning success being the Peace of Versailles, 1783.

Rogers, William Penn Adair ("Will") (1879–1935) was America's foremost humorist and a famous stage and film star; was killed with Wiley Post on a holiday flight to Alaska Aug. 15, 1935.

Roland de la Platière, Madame Manon Jeanne (1754–93), was one of the leading figures of the French Revolution. Her husband, **Jean Marie Roland de la Platière** (1734–93), who was one of the Ministers during the Girondist period, escaped from Paris on the disruption of his Party, but his wife remained behind, and was sent to the guillotine. During her incarceration she wrote an *Appeal to Posterity*, remarkable for its beauty of sentiment and patriotic enthusiasm. Her husband committed suicide on receiving the news of her execution.

Rolland, Romain (1866–1944), an eminent French author whose finest work, *Jean-Christophe*, in ten vols., gained him the Nobel Prize for Literature, 1915.

Romilly, Sir Samuel, K.C. (1757–1818), a famous English lawyer who was Solicitor-General in 1806 and for many years had a distinguished career both in Parliament and at the Bar. He effected many improvements in the Criminal Law.

Rommel, Field-Marshal Erwin (1891–1944), was probably the ablest German general engaged in

the second world war. His conduct of the war during the North African campaign won high praise and brought the redoubtable Afrika Corps nearly to Alexandria. He was also engaged in the campaigns in Western Europe in 1940 and 1944.

Romney, George (1734–1802), was born in North Lancashire, studied portrait painting with a Kendal artist, and for a few years obtained a living by local portrait painting. Going to London in 1762, his talent gained him speedy recognition; and after studying for a couple of years in Rome, he set up as a portrait-painter in Cavendish Square, and became highly successful. His portraits are among the finest examples of that kind of art that England has produced, and to-day realise large prices.

Röntgen, Professor Wilhelm Konrad (1845–1923), the eminent German scientist who discovered the Röntgen rays in 1895. He made other important laboratory investigations, resulting in the solution of difficult chemical problems.

Roosevelt, President Franklin Delano (1882–1945), great American statesman. Was Assistant Secretary to the Navy under Wilson and unsuccessful Democratic candidate for the vice-presidency in 1920. In 1921 was stricken with infantile paralysis, but recovered sufficiently to re-enter public life and become Governor of New York in 1929. From 1933 until his death served as President of the U.S.A., being the first American to be elected for more than two terms. His New Deal programme (see Gen. Information Section) was outstanding in his domestic policy. His "good neighbor" attitude towards the other American countries, his hamstrung efforts to restrain Axis aggression in the 1930s, his inspired and generous adoption of Lend-Lease, his war-time meetings with Churchill and Stalin, and his energetic prosecution of the war after Pearl Harbour, were the more important features of his foreign policy. His "fireside" talks on the radio brought him into close contact with the American people and his passing in the hour of victory was mourned all over the world. In 1905 married his distant cousin, Eleanor Roosevelt (1884–1962), who became known on her own account as a sociologist and newspaper columnist. She became Chairman of the U.N. Human Rights Commission in 1947.

Roosevelt, Theodore (1858–1919), Republican President of the U.S.A., 1901–9, and unsuccessful third party candidate in 1912 following a dispute with Taft. His daring exploits in the Spanish-American war won him wide popularity and he was elected vice-president in 1900 becoming president on McKinley's assassination. For his efforts in promoting peace, notably between Russia and Japan, was awarded the Nobel Prize in 1906. The great struggle with the Trusts marked his years of office.

Rops, Félicien (1833–98), Belgian artist, famous for drawings, etchings, and illustrations. His work is highly original, spirited, humorous and a valued commentary on the life at the time. Was an engraver of magnificent technical skill and a painter of merit.

Ross, Sir James Clark, F.R.S. (1800–62), most experienced polar explorer of the century. He accompanied his uncle, Sir John Ross, and Captain Parry on their expeditions. In the *Victory* commanded by his uncle he located the north magnetic pole in 1831. He commanded the expedition of the *Erebus* and the *Terror* to the antarctic (1839–43), discovering Victoria Land, Mounts Erebus and Terror, and the Ross ice barrier.

Ross, Rear Admiral Sir John, K.C.B. (1777–1856), the eminent explorer who made several voyages to the arctic and searched for the North-west Passage. He discovered Boothnia peninsula, and his nephew reached the magnetic pole.

Ross, Colonel Sir Ronald, K.C.B., K.C.M.G., F.R.S. (1857–1932), professor of tropical sanitation and a leading authority on tropical diseases generally, was for many years in the Indian Medical Service, and was awarded the Nobel Prize for Medicine in 1902. Discovered the malaria parasite.

Rossetti, Dante Gabriel (1828–82), was the son of Gabriele Rossetti (1783–1852), an exiled Italian author who settled in London in 1824. Dante showed great talent as a painter from boyhood, and became one of the Pre-Raphaelite Brotherhood, formed in 1848. He also distinguished himself as a poet. His sister, Christina Georgina Rossetti (1830–94) was also noted as a poet.

Rossini, Gioacchino Antonio (1792–1868), Italian operatic composer. His first opera *Tancredi* was produced at Venice when he was 21, and between 1816 and 1823 he wrote 21 operas, including *Il Barbiere di Seviglia*, *La Cenerentola*, *Otello*, *La Donna del Lago*, and *Semiramide*. After writing *Guillaume Tell* in 1829, which was hailed as his masterpiece, he gave up composing, producing only a *Stabat Mater* (1832–41) and a mass (1864). *See* Section E.

Rostand, Edmond Eugene Alexis (1868–1918), French dramatist whose *Cyrano de Bergerac* created a sensation in 1898.

Rothenstein, Sir William (1872–1945), English painter and writer. Prof. of Civic Art in Sheffield University, 1917–26; Principal of Royal College of Art, 1920–35; Trustee, Tate Gallery, 1927–33. His son, Sir John Rothenstein (b. 1901), was until 1964 Director of the Tate Gallery and is now Rector of St. Andrews University.

Rothschild, Anselm Meyer (1743–1812), the founder of the famous financial family was born at Frankfurt-on-Main. After some experience in a bank as clerk, set up for himself first as a moneylender, then as a banker and displaying a genius for finance acquired a large fortune. His son, Nathan Meyer Rothschild (1777–1836), took charge of the London house, and conducted its affairs with great success, and was made an Austrian Baron in 1822. He was succeeded by his eldest son, Baron Lionel de Rothschild (1808–1879), who was the first Jewish member of the House of Commons.

Roubillac, Louis François (1695–1762), a French sculptor who contributed many monuments to Westminster Abbey.

Rouget de Lisle, Claude Joseph (1760–1836), a French poet who was the author of the words and the music of the *Marseillaise*, the revolutionary song and national anthem of France.

Rousseau, Jean-Jacques (1712–78), French philosopher, political writer, and composer. He was born at Geneva, and after a hard and wandering life made the acquaintance of Madame de Warens, who became his patroness and with whom he resided during the years 1731–41. He then proceeded to Paris, where he made the acquaintance of Diderot, to whose *Encyclopédie* he contributed the musical section. With the production of his pastoral melodrama *Le Devin du village* in 1722 he appeared as a successful composer. Meanwhile he had been studying social questions with great ardour, and in 1761 published his novel *Julie, ou la Nouvelle Héloïse*, which was followed in 1762 by *Emile*, a treatise on education in novel form. These two works contained so much that was at variance with convention, and so opposed to all ideas of moral restraint, that they called forth the condemnation of the orthodox, and Rousseau was obliged to leave France for a time. It was while in England that he wrote his remarkable *Confessions*, and his celebrated *Le Contrat Social*. He laid down principles of government and conduct which bore fruit in the French Revolution. (*See also* Education, Section J.)

Rubens, Sir Peter Paul (1577–1640), one of the most notable of Flemish painters. In 1629 he painted for Charles I., who knighted him. His *Adoration of the Magi* was sold in 1959 for the record price of £275,000.

Rubinstein, Anton Grigorovich (1829–94), a famous Russian pianist and composer and founder of the Conservatory St. Petersburg (now Leningrad). His brother Nicholas (1835–81), also a pianist, founded the Conservatory of Moscow.

Rupert, Prince (1619–82), the brilliant Royalist cavalry general opposing Cromwell and a distinguished admiral in the Dutch wars. He was also an early mezzotinter, an experimental scientist, and the first governor of Hudson's Bay Company.

Rusk, Dean, M.A., LL.D. (b. 1909), U.S. Secretary of State in the Democratic Administrations of Kennedy and Johnson, 1961–; Pres. The Rockefeller Foundation, 1952–60. Former Rhodes scholar at St. John's Coll., Oxford.

Ruskin, John (1819–1900), writer and art critic, the son of a wealthy London wine merchant. His *Modern Painters* exhibited a masterly perception of the principles of art and a boundless gift of literary expression. Other volumes appeared at intervals including *The Seven Lamps of Architecture* and *The Stones of Venice*, two memorable works which considerably enhanced the author's fame. His writings undoubtedly hastened the recognition of Turner and the Pre-Raphaelite painters. Always taking a deep interest in economic questions, Ruskin delivered and published numerous lectures on a wide range of subjects—art, pleasure, religion, war, work, and so forth; and he was acknowledged to be one of the greatest thinkers of the time. Often his views were impracticable and even eccentric, but behind them there was always evident a sincere desire to promote the well-being of the people.

Russell, Bertrand (Arthur William) 3rd Earl, O.M., F.R.S., M.A. (b. 1872), great English rationalist philosopher, whose vigorous and sceptical writings have profoundly influenced present-day thought. He writes and speaks in a clear, witty, and elegant style and regards the task of the philosopher as one of clarification rather than speculation. In recent years Lord Russell has been actively engaged in the campaign against nuclear warfare. His numerous writings include books on mathematics, philosophy, and ethics, besides works on political and sociological subjects: *The Principles of Mathematics* (1903), *Principia Mathematica* (1910), written in collaboration with A. N. Whitehead, *Problems of Philosophy* (1911), *Marriage and Morals* (1929), *History of Western Philosophy* (1945), *Human Knowledge* (1948), *Commonsense and Nuclear Warfare* (1959). The first volume of his *Autobiography* was published in 1967. Nobel Prize for Literature, 1950.

Russell, George William (1867–1935), Irish poet generally known by his pen name of A.E. or Æ. Widely known as a leader in co-operative enterprise and a pioneer of Abbey Theatre, Dublin.

Russell, John, 1st Earl, K.G., P.C. (1792–1878), third son of the 6th Duke of Bedford. Entered Parliament as Lord John Russell on attaining his majority, and, ranging himself on the Liberal side, showed great capacity for affairs. Introduced first great measure of Reform, which was passed in 1832. Held several offices before succeeding Peel as Prime Minister in 1846. Remained in power until 1852, and was again Prime Minister from 1865 to 1866, resigning when he failed to carry a further reform bill. He also wrote lives of Thomas Moore and Charles James Fox.

Russell of Killowen, Baron, P.C., G.C.M.G. (1832–1900), Lord Chief Justice of England 1894–98. Was one of the greatest British judges and advocates of the 19th century.

Rutherford, Lord, O.M., F.R.S. (1871–1937), British physicist, b. in New Zealand, pre-eminent in the field of atomic research. Conducted his experiments at Montreal, Manchester, and at the famous Cavendish Laboratory at Cambridge, which attracted brilliant young scientists from all over the world. In 1911 announced his nuclear theory of the atom, and in 1918 succeeded in splitting the atom for the first time. His work paved the way for future nuclear research.

Ruysdael, Jacob van (*c.* 1628–82), great Dutch landscape painter, some of whose pictures are in the National Gallery.

Ruyter, Admiral Michiel Adriaanzoon de (1607–76), the Dutch admiral who in 1667 invaded England with a fleet of Dutch war vessels, advancing up the Thames and Medway and setting fire to considerable shipping. He soon saw fit to retreat, and more serious trouble was averted.

S

Sachs, Hans (1494–1576), the German shoemaker-poet of Reformation times, was an earnest worker in the Protestant cause, and wrote over 5,000 different pieces, poetry and prose.

Sadi, or Saadi (Muslih-Uddin) (*c.* 1184–1292), the Persian poet who flourished in the 13th century, and won national fame by his poems *The Garden of Roses* and *The Orchard*.

Sainte-Beuve, Charles Augustin (1804–69), French critic, and one of the most accomplished men of letters under the Second Empire. Author of *Causeries du lundi* and *Histoire de Port Royal*.

Saint-Just, Antoine (1767–94), one of the later leaders of the French Revolution closely associated with Robespierre.

St.-Laurent, Rt. Hon. Louis Stephen, Q.C. (b. 1882). Prime Minister of Canada, 1948–57.

Saint-Saëns, Charles Camille (1835–1921), French composer. His compositions have a classical style and elegance and include symphonic and chamber music and the opera *Samson et Dalila*, which was produced by Liszt at Weimar in 1877.

Saint-Simon, Claude, Comte de (1760–1825), a French scientist and socialist who had great influence upon the thought of his time.

Saintsbury, George Edward Bateman (1845–1933). Professor of Rhetoric and English Literature, Edinburgh University, 1895–1915. Author of numerous critical works on literary subjects, on which he was a leading authority.

Sala, George Augustus Henry (1828–95), journalist of high literary merit who contributed to *Household Words*, the *Illustrated London News*, and the London *Daily Telegraph* (foreign correspondent in all parts of the world).

Saladin (1137–93), the great Sultan of Egypt and Syria who led the Moslems against the Christians in the Third Crusade. In 1187 he had driven the Christians from Jerusalem after a brilliant victory at Hattin near Tiberias. This gave rise to the Third Crusade led by the Emperor Frederick I., Philip II. of France, and Richard I. of England, which achieved little. Besides being a great warrior, Saladin was a wise and cultured man, renowned for his chivalry.

Salazar, Antonio d'Oliveira (b. 1889), Prime Minister and virtual dictator of Portugal since 1932 and responsible for drafting the Portuguese constitution of 1933. Foreign Minister, 1936–47.

Salda, František (1867–1937), Czech critic, essayist, and poet whose influence on Czech thought has been profound.

Salimbene de Adamo (1221–*c.* 1288), mediæval chronicler whose vivid description of life in the 13th century is embodied in his *Cronica*.

Salisbury, Robert Arthur Talbot Gascoyne Cecil, 3rd Marquess of, K.G. (1830–1903), led the Conservative Governments of 1885–86, 1886–92, and 1895–1902., Has been considered one of the best Foreign Secretaries England has ever had, holding the office from 1878 to 1880, when he attended the Congress of Berlin, and for much of his premiership. Retired from political life after peace was declared in South Africa. His grandson, **Robert Arthur James Gascoyne-Cecil, 5th Marquess of Salisbury**, K.G. (b. 1893), was Leader of the House of Lords, 1942–45 and again 1951–57 when he resigned from the Government over its Cyprus policy.

Samuel, 1st Viscount, P.C., O.M., G.C.B., G.B.E. (1870–1963), Liberal statesman, High Commissioner for Palestine, 1920–22; Postmaster-General, 1910–14, and again May to Dec. 1915; Home Secretary, 1916, and again 1931–32. M.P. for Cleveland Division (N. Riding, Yorks), 1902–18, and Darwen Div. of Lancs., 1929–35. Chancellor of the Duchy of Lancaster, 1909–10 and 1915–16. Leader of the Liberal Party in the Commons, 1931–35, in the Lords, 1941–55.

Sand, George (1804–76) the leading French authoress of her time—proper name, Armandine Lucile Aurore Dupin, baronne Dudevant—who, both as novelist and dramatist, achieved the highest success. A friend of men of such singular power as Alfred de Musset, Chopin and Sandeau.

Sandow, (Frederick William) Eugene (1867–1925), German "strong man"; overcame his early physical weakness to become a powerfully built man; adviser on physical culture to King George V.

Sanger, Frederick, B.A., Ph.D., F.R.S. (b. 1918), British scientist; Prof. of Biochemistry, Cambridge. Awarded 1958 Nobel Prize for Chemistry for his work in determining the chemical structure of the protein insulin.

Sankey, Ira David (1840–1908), the celebrated American evangelist, singer, and composer, associated with Dwight L. Moody, the revivalist (1837–1899) in mission-work.

San Martin, General José de (1778–1850), the

principal figure in the liberation from Spanish rule of three countries: his native Argentina, Chile, and Peru.

Santayana, George (1863–1952), philosopher and poet, born in Madrid of Spanish parentage. He was Professor of Philosophy at Harvard University (where he graduated in 1886) from 1907–12. His books include *The Life of Reason* (1905–6), the four volumes of *Realms of Being* (1923–40), *Persons and Places* (1945), and *The Middle Span* (1948).

Santos-Dumont, Alberto (1873–1932), Brazilian aeronaut, his most notable flights being made in Paris, and at Monte Carlo. He visited London in 1903.

Sappho of Lesbos (fl. early 6th cent. B.C.), famous lyric poetess of ancient Greece, of whose love poems only a few fragments remain.

Sardou, Victorien (1831–1908), French dramatist who had a long series of successes—*Nos Intimes, Séraphine, Rabagas, Divorçons, Fédora, Théodora, Patrie, La Tosca, Madame Sans-Gêne, Robespierre*, and *Dante*, the last-named written specially for Sir Henry Irving. He was elected to the French Academy in 1877.

Sargent, Sir Malcolm, Mus.D., A.R.C.O. (1895–1967), British conductor, renowned for his conductorship of the Promenade Concerts from 1950 until his death; succeeded Sir Adrian Boult as conductor of the B.B.C. Symphony Orchestra, 1950–57.

Sargent, John Singer, R.A. (1856–1922). American painter, born in Florence, educated in Germany and Italy, noted for his portraits of celebrities.

Sartre, Jean-Paul (b. 1905), French existentialist philosopher, left-wing intellectual, dramatist, essayist and novelist. His major philosophical work is *L'Etre et le Néant* and his plays include *Les Mouches, Huis Clos, Crime passionnel, La Putain respectueuse*, and *Les Séquestrés d'Altona*. The first volume of his autobiography, *Les Mots*, was published in 1964. He was awarded (though he declined it) the 1964 Nobel Prize for Literature. *See* Section I.

Sassoon, Siegfried (Lorraine), C.B.E. 1886–1967 English poet and writer who received the Hawthornden Prize, 1929, for *The Memoirs of a Fox-hunting Man*.

Savonarola, Girolamo (1452–98), Florentine preacher and reformer, a Dominican friar, who denounced vice and corruption not only in society but also in the Church itself, especially attacking Pope Alexander VI. He was excommunicated, imprisoned, and with two of his companions hanged in public. His passion for reform made him impatient of opposition and incapable of compromise. He understood men's hearts but not their limitations. Yet he was a noble figure rightly commanding the respect of later ages. George Eliot's historical romance *Romola* gives a fine portrait of Savonarola.

Sayce, Prof. Archibald Henry, D.Litt., LL.D., D.D. (1845–1933), a distinguished Assyriologist and philologist who was Prof. of Assyriology at Oxford University, 1891–1919. His most important works are *Introduction to the Science of Language*, 1879, *Ancient Empires of the East*, 1884, *The Principles of Comparative Philology*, 1874, and *Egypt and Babylonian Religion*, 1903.

Scarlatti, Alessandro (1659–1725), Italian musician whose influence on the history of opera has been great, founded the Neapolitan school. He composed over 100 operas, 200 masses, and over 700 cantatas and oratorios. His son Domenico (1685–1757) was a harpsichord virtuoso and his work has had an important influence in the evolution of the sonata. The chief years of his life were spent at the Spanish Court in Madrid.

Schiaparelli, Giovanni Virginio (1835–1910), famous Italian astronomer who was Director of the Milan Observatory, 1862–1900, and did valuable work on meteors and double stars, but is best known for his discovery of so-called canals on Mars.

Schiller, Johan Christoph Friedrich (1759–1805), the famous German dramatist and poet. Was born at Marbach in Württemberg. Educated at the military Academy at Stuttgart, and intended for a soldier, he evinced an irresistible desire for literary fame, and in 1782 had his first play, *The Robbers*, successfully produced at the Mannheim Theatre, to which he was subsequently appointed dramatic composer. Later he went to Dresden, where he completed his *Don Carlos*; from 1789 to 1793 he held the chair of history at Jena Univ. when he wrote his *History of the Thirty Years' War*, and gained the friendship of Goethe, at whose suggestion he removed to Weimar, and during the next ten years produced his greatest works—*Wallenstein, Mary Stuart, The Maid of Orleans*, and *William Tell*.

Schlegel, Karl Wilhelm Friedrich von (1772–1829), German poet, critic, and scholar. As founder of the Romantic School (J39) we owe to him and his followers the revolutionary and germinating ideas which so influenced thought at the beginning of the 19th century. His brother **August Wilhelm** (1767–1845) also has a permanent place in the history of German literature. He is best known for his translations of Shakespeare (which established Shakespeare in Germany), Dante, Calderón, and Camões.

Schliemann, Heinrich (1822–90), German archæologist who made many notable excavations, discovered Troy and other Homeric sites.

Schnabel, Artur (1882–1951), American pianist of Austrian birth, regarded as the greatest exponent of Beethoven's pianoforte sonatas.

Schoenberg, Arnold (1874–1951), Austrian composer who in 1933 was dismissed from his post as head of the Prussian Academy of Fine Arts because of his Jewish ancestry. He went to the United States, teaching first at Boston and then at Los Angeles. Among his works are the choral orchestral *Gurre-Lieder* and *Pierrot Lunaire*, a cycle of 21 poems for voice and chamber music. *See* Section E.

Schopenhauer, Arthur (1788–1860), German philosopher of a pessimistic cast of mind, a great admirer of Plato and Heraclitus. Regarded his contemporary Hegel as a charlatan. His chief works are *The World Considered as Will and Idea* and *The Two Fundamental Problems of Ethics*.

Schreiner, Olive, pen name of Mrs. Cronwright Schreiner (1855–1920), a noted South African novelist, born in Basutoland. She first attracted attention with her *Story of an African Farm* (1883). She excelled in depicting veldt scenery and Dutch character.

Schubert, Franz Peter (1797–1828), Austrian composer, born in Vienna, the son of a schoolmaster. He was a contemporary of Beethoven and wrote not only symphonies, sonatas, string quartets, choral music, and Masses but also over 600 songs of unsurpassed lyrical beauty. It is as creator of the German *Lied* that his name is immortal. He died in Vienna at the age of 31, in poverty, before the full flowering of his musical genius.

Schumann, Robert Alexander (1810–56), composer of the early 19th-century German Romantic school. He wrote much chamber music, four symphonies, a piano concerto, and choral music, but it is his early piano pieces and songs that give constant delight. His wife Clara (1819–96) was one of the outstanding pianists of her time, especially as interpreter of Chopin.

Schweitzer, Albert, D.Theol., Dr. Phil., Dr. Med. (1875–1965), famous medical missionary in Lambaréné, remembered for his reverence for life. A musical critic and authority on Bach's music, a famous organist, and a noted biblical critic he became a Doctor of Medicine in order to devote his life to missionary work in Equatorial Africa. Awarded 1952 Nobel Prize for Peace and Hon. O.M. in 1955.

Scipio, Publius Cornelius (*circa* 232–183 B.C.), the greatest of the Scipios known as Scipio Africanus the elder. A distinguished Roman general in the 2nd Punic War.

Scott, Charles Prestwich (1846–1931), English journalist who was editor of the *Manchester Guardian*, 1872–1929, which under his editorship became one of the leading journals of the country.

Scott, Sir George Gilbert, R.A. (1811–78), architect who gained special fame for his restorations of Gothic churches and cathedrals, incl. Westminster Abbey, designer of the Albert Memorial, St. Pancras Station, the Martyrs' Memorial at Oxford, and St. Anne's Church in Alderney.

Scott, Sir Giles Gilbert, O.M., R.A., F.R.I.B.A. (1880–1960), architect whose work includes the great modern Gothic Liverpool Cathedral, the Bodleian Library, Oxford, and the Forth Road Bridge (opened 1964). Grandson of the above.

Scott, Peter Markham, M.B.E., D.S.C. (b. 1909), son of Captain Scott, is known as yachtsman, broadcaster, and bird-artist.

Scott, Captain Robert Falcon, C.V.O. (1868–1912), commanded the National Antarctic Expeditions in 1901–4 and in 1910. His ship, the *Terra Nova*, left England on June 1, 1910. In Jan. 1911, winter quarters were established at Cape Evans, and in the following November Scott and a select party left Hut Point for the South Pole, which they reached on Jan. 18, 1912, finding there the Amundsen records. On the return journey every member of the party perished. Leading-seaman Edgar Evans died from concussion of the brain on Feb. 17; Capt. Oates from exposure on March 17; and on March 29 the rest of the party (Scott, Wilson and Bowers) died from starvation and exposure in a blizzard when only 11 miles from One Ton Depot.

Scott, Sir Walter, Bart. (1771–1832), one of the greatest of British novelists and a distinguished poet. He was educated for the Bar. His *Minstrelsy of the Scottish Border* was published in 1802. This was followed in 1805 by *The Lay of the Last Minstrel*, in 1808 by *Marmion*; *The Lady of the Lake*, *Rokeby* and *The Lord of the Isles* coming afterwards in quick succession. In 1814 he published *Waverley* anonymously, which obtained instant success. Other stories followed and the Waverley novels and their author, "The great Unknown," were everywhere the subject of discussion. *Guy Mannering*, *The Antiquary*, *Old Mortality*, *Rob Roy*, and the *Heart of Midlothian* were all published before the secret of their authorship was disclosed. The chief works of his last years were *Woodstock*, *Life of Napoleon*, and *Tales of a Grandfather*. He died at Abbotsford. Created a baronet in 1820.

Scott-Paine, Hubert (1891–1954), pioneer in the design and construction of aircraft and sea craft.

Scriabin, Alexander (1872–1915), Russian composer and pianist. He studied at the Moscow conservatoire, where he was later professor of the pianoforte, 1898–1904. He was deeply interested in theosophy, and in such works as *The Divine Poem*, and *Prometheus: a Poem of Fire* he attempted to unite music and philosophy

Seeley, Sir John Robert, K.C.M.G. (1834–95), English historian and author of *Ecce Homo*.

Segovia, Andres (b. 1894), Spanish concert-guitarist. He has adapted works by Bach, Haydn, Mozart, and other classical composers to the guitar.

Selfridge, Harry Gordon (1858–1947), the American who revolutionised the British department store when he opened the famous shop of Selfridges in Oxford Street in 1909.

Semmelweis, Ignaz Philipp (1818–65), Hungarian physician, a pioneer in employing antiseptic methods in obstetric cases, having discovered that puerperal fever is an infection caused by germs. It was then the practice of doctors in maternity wards to examine expectant mothers with unwashed hands.

Seneca, Lucius Annaeus (*circa* 4 B.C.–A.D. 56), the famous stoic philosopher, who was tutor to Nero, and one of that emperor's most influential advisers; he was sentenced to end his own life, a sentence which he courageously carried out.

Senefelder, Alois (1772–1834), was the son of an actor at Munich, and himself engaged in dramatic composition. Being too poor to bear the cost of having his works printed, he turned his attention to inventing lithography, the main feature of the invention being discovered by accident.

Severus, Lucius Septimius (146–211), was Roman Emperor from 193 to his death. After many victories in the East he passed over to Britain with an army, subjugated the Caledonians, and repaired and partly rebuilt the famous Hadrian's wall from the Solway Firth to the mouth of the Tyne. He died at York.

Sévigné, Marie de Rabutin-Chantal Marquise de (1626–96), French woman of letters. Her letters to her daughter Françoise written in an unaffected elegance of style give a moving picture of fashionable society in 17th-century France.

Sgambati, Giovanni (1841–1914), Italian pianist and composer who revived interest in classical instrumental music in an age of opera. Well known is his quartet in D flat.

Shackleton, Sir Ernest (Henry), C.V.O., O.B.E. (1874–1922), commander of the Nimrod Farthest South expedition of 1907–9, reached within 100 miles of the South Pole, and embarked on a new expedition in 1914. He died whilst on a scientific voyage to the Antarctic.

Shaftesbury, Anthony Ashley Cooper, 7th Earl of (1801–85), great social reformer, largely responsible for the legislation reducing the misery of the industrial revolution. He agitated for the abolition of slavery and was connected with the Ragged School Union, reformatories, refuges, and Christian associations of many kinds.

Shakespeare, William (1564–1616), England's greatest poet and dramatist, was born at Stratford-on-Avon, and was the son of a tradesman of that town who must have been at one time fairly well-off, seeing that he was made an alderman, and afterwards served as High Bailiff. Later on, however, he appears to have been unfortunate and fallen into straitened circumstances. William was the eldest son, and was probably educated at the Stratford Grammar School, but very little is known of his career up to his eighteenth year, when we have it on record that he married Anne Hathaway, who was eight years his senior. Five years after his marriage he went to London, and the next we hear of him is that he was connected with the Globe Theatre and appeared in sundry small parts. He first appeared before the public as a poet in 1593, with his *Venus and Adonis*, following this in 1594 with *The Rape of Lucrece*. Shortly afterwards he was proprietor of the Globe Theatre, and also had an interest in the Blackfriars Theatre. Then he began that remarkable career of play-writing which has since been the wonder of the world. Thirty-eight plays comprise the Shakespeare canon. Thirty-six were printed in the First Folio of 1623 (the first collected edition of his dramatic works), of which eighteen had been published during his lifetime in the so-called Quartos. *Love's Labour's Lost* and *The Comedy of Errors* seem to have been among the earliest, being followed by *The Two Gentlemen of Verona*, and *Romeo and Juliet*. Then followed *Henry VI*, *Richard III*, *Richard II*, *Titus Andronicus*, *The Taming of the Shrew*, *King John*, *The Merchant of Venice*, *A Midsummer Night's Dream*, *All's Well that Ends Well*, *Henry IV*, *The Merry Wives of Windsor*, *Henry V*, *Much Ado about Nothing*, *As You Like It*, *Twelfth Night*. Then came some of his greatest plays, *Julius Cæsar*, *Hamlet*, *Troilus and Cressida*, *Othello*, *Measure for Measure*, *Macbeth*, *King Lear*, *Timon of Athens*, *Pericles*, *Antony and Cleopatra*, *Coriolanus*, *Cymbeline*, *A Winter's Tale*, *The Tempest*, *Henry VIII*, and *The Two Noble Kinsmen*. He was able to purchase property at Stratford, and when he retired from his profession (about 1610 or 1612) he returned to his native town to live in a house which he had himself built. He was buried in Stratford Church.

Sharp, Granville (1735–1813), slavery abolitionist and founder of the colony of Sierra Leone.

Shastri, Shri Lal Bahadur (1904–66), Indian politician who became Prime Minister of India after the death of Nehru in 1964. He died of a heart attack at the end of the Soviet-sponsored Tashkent talks. *See also* Section C, Part I.

Shaw, George Bernard (1856–1950), brilliant Irish dramatist who conquered England by his pungent wit and devastating exposure of hypocrisy, cant and national weaknesses, and persistently expressed a highly individual opinion whether in his musical criticisms, socialist pamphlets or plays. He wrote many plays including *Man and Superman*, *Heartbreak House*, *Back to Methuselah*, *Saint Joan*, *The Apple Cart*, *Buoyant Billions*, most of which have important prefaces, sometimes equalling the play in length. Was music critic (1888–94) successively to the London *Star* and *World* and during this period wrote *The Quintessence of Ibsenism* and *The Perfect Wagnerite*. Joined the Fabian Society in 1884 and was awarded Nobel Prize for Literature in 1925. He was greatly interested in the reform of the alphabet.

Shelley, Percy Bysshe (1792–1822), one of the most brilliant poetic geniuses of the 19th century, renowned for the daring and unorthodox opinions which he held. His *Queen Mab* (written when he was nineteen), his *Alastor*, *The Revolt of Islam*, *The Witch of Atlas*, and *Adonais* all breathe the true spirit of poetry.

securing him a place in the first rank of British poets. He showed fine dramatic gifts in the *Cenci* and *Prometheus Unbound*, almost reaching sublimity in the latter masterpiece. His *Adonais* was a splendid tribute to the genius of Keats. His first wife, whom he married while very young, committed suicide. He afterwards married Mary Wollstonecraft Godwin, and formed other attachments of a complicating nature. Was always at war with his family, and finally, after spending some time with Byron and Leigh Hunt and other friends in various parts of Italy, was drowned in the Gulf of Spezia by the capsizing of his boat in a storm.

Sheppard, Very Rev. Hugh Richard Lawrie (Dick), C.H., D.D. (1880–1937), Vicar of St. Martin-in-the-Fields, London, 1914–27, where he established a reputation by his broadcast sermons and attracted large crowds of listeners. Dean of Canterbury, 1929–31; Canon of St. Paul's, 1934–37. Buried in Canterbury Cathedral.

Sheraton, Thomas (1751–1806), was the last of the great English furniture designers of the 18th cent. There is no evidence that he was a maker of furniture; his reputation rests solely on his published works which helped to create a certain trend or style, notably the *Cabinet-Makers' and Upholsterers' Drawing Book* (1791–94).

Sheridan, Rt. Hon. Richard Brinsley Butler (1751–1816), one of the greatest of English playwrights, whose comedies are frequently revived. Was born in Dublin, and educated partly at Harrow. Showing considerable capacity for dramatic composition he obtained an introduction to the Covent Garden management, and it was at the Covent Garden Theatre in 1775 that his first comedy, *The Rivals*, was produced, with such a gratifying result that Garrick, who was then at Drury Lane, opened up negotiations with the dramatist which ended in Sheridan becoming part (and ultimately sole) proprietor of Drury Lane. *The Duenna*, a musical comedy, was produced in 1775, and ran through the winter. From 1777 Sheridan managed Drury Lane, opening with an adaptation of Vanbrugh's *Relapse*. This was followed by the production of the greatest of his comedies, *The School for Scandal*, which had a wonderful success. In 1779 *The Critic* was given, and after that Sheridan wrote no more plays until 1789, when *Pizarro* was produced. In the meantime he had gained a high reputation in another sphere. In 1780 he obtained a seat in Parliament and although he only spoke on certain set occasions, he acquired a reputation for oratory which stood him in very good stead, and he filled one or two minor Ministerial offices, remaining in Parliament until 1812.

Sherman, General William Tecumseh (1820–91), a famous American soldier who, after taking part in the War with Mexico (1846–48), volunteered at the outbreak of the Civil War (1861). He took part in the battles of Bull Run and Shiloh, and was placed in command of the Army of the Tennessee (1863) and of the military division of the Mississippi with a force of 100,000. In 1864 there occurred the famous 300-mile march across Georgia to the sea. In 1865 his second march, through the Carolinas, culminated in the defeat of Johnston, which led directly to the termination of the war.

Sherrington, Sir Charles Scott, O.M., G.B.E., F.R.S., M.D., D.Sc. (1857–1952), one of the greatest of British scientists, and a leading authority on the physiology of the nervous system, whose research work over many years led to great advances in the surgery of the brain. Pres. of the British Association 1920, and of the Royal Society, 1920–25. Awarded Nobel Prize for Medicine, 1932.

Shirley, James (1596–1666), was an eminent dramatist and poet, imbued with the Elizabethan traditions.

Sholokhov, Mikhail Aleksandrovich (b. 1905), great Russian novelist who won international fame with his novel *And Quiet Flows the Don*. Nobel Prize for Literature, 1965.

Shostakovich, Dmitri (b. 1906), one of the most celebrated of present-day Russian composers. His music is complex, profound, and deeply significant of the Soviet age in which he lives. His works include operas, ballets, symphonies, chamber music, and music for films. Hero of Soviet Labour (1966). *See* Section E.

Sibelius, Jean Julian Christian (1865–1957), Finnish composer, generally acknowledged as the greatest of the century. Works include seven symphonies, violin concerto, several tone poems, about 200 pianoforte compositions and songs. *See* Section E.

Sickert, (Walter) Richard (1860–1942), British painter and etcher; became President of Royal Society of British Artists, 1928.

Siddons, Sarah (1755–1831), the greatest of the English tragic actresses, b. at Brecon, South Wales, eldest of the famous Kemble family. She made her first appearance in London at Drury Lane in 1775 in the part of Portia.

Sidgwick, Henry (1838–1900), Professor of Moral Philosophy at Cambridge, and besides being an eminent educationist in the broader sense, devoted himself with special success to the cause of women's education, Newnham and Girton being largely the outcome of his efforts.

Sidney, Sir Philip (1554–86), statesman, poet and soldier; was one of Queen Elizabeth's favourites, and a man of singular ability and bravery. While living in temporary retirement he composed his famous *Arcadia*, but did not allow it to be published in his lifetime. He did not lack for literary fame, however, his *Apology for Poetry* and *Defence of Poesy*, as well as numerous miscellaneous pieces all distinguished for their beauty of expression and tender sentiment, having won much favour, especially in the circle of the Court. In 1586 he was given a command in the Netherlands and was killed at Zutphen.

Siemens, Sir William, F.R.S. (1823–83), a German-born scientist and inventor, chiefly in the field of heat and electricity. Constructed many overland and submarine telegraphs. Brother of Werner v. Siemens, founder of the famous firm of Siemens-Halske.

Sienkiewicz, Henryk (1846–1916), famous Polish novelist; Nobel prizewinner, 1905 (*Quo Vadis*).

Sikorski, Wladyslaw (1881–1943), Polish general and statesman; Prime Minister in exile during second world war. Killed in airplane crash near Gibraltar.

Simpson, Sir James Young, Bt., F.R.S. (1811–70), the discoverer of the utility of chloroform as an anæsthetic, was a native of Scotland, and was a most accomplished experimental surgeon.

Sinclair, Upton (b. 1878), American novelist whose documentary novel *The Jungle* about the Chicago slaughter yards caused a sensation in 1906.

Singer, Isaac Meritt (1811–75), American mechanical engineer who devoted himself to the improvement of the early forms of the sewing-machine and patented a single-thread and chain-stitch machine.

Sisley, Alfred (1839–1899), French Impressionist painter of English origin. Painted with great delicacy and sensitivity, landscapes, villages, trees, and rivers. Influenced by Corot and Manet.

Sitwell, Edith (Louisa), D.B.E. (1887–1964), English poet whose works include *Bucolic Comedies*, *Gold Coast Customs* and *Collected Poems*. Her two brothers are Osbert (b. 1892), a well-known poet and novelist, and Sacheverell (b. 1900), a poet and critic. *See also* Section M.

Slim, Field-Marshal Viscount, K.G., G.C.B., G.C.M.G., G.C.V.O., G.B.E., D.S.O., M.C. (b. 1891), Gov.-Gen. of Australia 1953–59. In 1943 took command of the 14th Army in Burma, later becoming commander of the Allied Land Forces, S.E.A.C., and then Commandant of the Imperial Defence College. Succeeded Lord Montgomery as C.I.G.S., 1948–52. Gov. and Constable Windsor Castle, 1964–.

Sloane, Sir Hans, Bt., F.R.S. (1660–1753), was born in County Down, Ireland, but settled in London, and became famed as a physician and naturalist. For some years he held the office of President of the Royal College of Physicians, and was elected President of the Royal Society in succession to Sir Isaac Newton. His Library of 50,000 vols., and treasures in natural history and MSS., worth £50,000 to £80,000, were offered by his will to the nation and bought for £20,000; with that nucleus the British Museum was founded.

Slowacki, Julius (1809–49), Polish romantic poet. He was a revolutionary, lived in exile and died in Paris. His tragedies include *Kordian*, *Balladyna* and *Lilli Weneda*.

Smeaton, John (1724–92), who rebuilt Eddystone Lighthouse, which had been burned down; he subsequently constructed many important works in connection with harbours and canals. He was also the inventor of an improved blowing apparatus for iron-smelting.

Smetana, Bedřich (1824–84), Czech composer, creator of a national style. He was principal conductor of the Prague National Theatre, for which he wrote most of his operas, including *The Bartered Bride* and *The Kiss*. Best known of his other compositions are the cycle of symphonic poems *My Country* and the string quartets *From My Life*. He became totally deaf in 1874, suffered a mental breakdown, and died in an asylum. *See* Section E.

Smiles, Dr. Samuel (1812–1904), was in early life a medical practitioner; achieved wide popularity by his *Self Help*, a book that has had an enormous sale.

Smith, Adam, F.R.S. (1723–90), the father of the science of political economy. Author of *Theory of Moral Sentiments* and *Wealth of Nations*, which immediately obtained the admiration of the leading men of the day, and secured him the friendship of Gibbons, Hume, Burke, Reynolds, and Dugald Stewart.

Smith, Sir Grafton Elliot, M.A., Litt.D., D.Sc., F.R.S. (1871–1937), Australian anatomist and archaeologist who was professor of anatomy at Manchester and London Universities. His works include *The Royal Mummies* (1912), *Tutankhamen* (1923), *The Evolution of Man* (1924), and the *Diffusion of Culture* (1933).

Smith, Captain John (1580–1631), the noted seafarer and adventurer who in 1605 was the leading spirit of an expedition to Virginia, and founded Jamestown.

Smith, Joseph (1805–44), founder of Mormonism, son of a Vermont farmer. Claimed to have been granted revelation of the *Book of Mormon*, which came to be held as equal in authority and as a necessary supplement to the Scriptures. Smith, who was murdered, was not a polygamist; Brigham Young, who succeeded him, was. (*See* Mormonism, Section J.)

Smith, Sydney (1771–1845), an Anglican divine, who enjoyed a great reputation as a wit and writer. Founder of and contributor to the *Edinburgh Review* and author of *Peter Plymley's Letters*, supporting Catholic Emancipation.

Smith, William (1769–1839), English surveyor and geologist, the first to map the rock strata of England and to identify the fossils peculiar to each layer.

Smith, Sir William Alexander (1854–1914), b. in Glasgow; founder of the Boys' Brigade (1883), the oldest of the national organisations for boys in Britain.

Smith, William Robertson (1846–94), Scottish biblical scholar whose contributions to the 9th edition of *The Encyclopaedia Britannica* resulted in an unsuccessful prosecution for heresy and led to the modernisation of Scottish theology.

Smollett, Tobias George (1721–71), a famous novelist and humorist, b. in Scotland, whose *Roderick Random*, *Peregrine Pickle*, *Count Fathom* and *Humphry Clinker* abound in fun and genial characterisation, while their pictures of sea-life are inimitable.

Smuts, Field-Marshal Rt. Hon. Jan Christiaan, O.M., C.H., K.C. (1870–1950), South African soldier and statesman, one of the dominating political figures of our century. Born in Cape Colony, studied at Cambridge University, and called to the Bar. Was an outstanding Boer commando leader during the South African War, but afterwards worked for friendship with the British and took office in Botha's Government when the Union was set up in 1910. In the first world war joined the Imperial War Cabinet. As Prime Minister, 1919–24, helped to launch the League of Nations, and later was associated with the United Nations. Prime Minister, Foreign Minister and Minister of Defence from 1939 to 1948 when he was defeated at the General Election by the Nationalists under Dr. Malan. He was a keen botanist; Pres. of British Association, 1931. Published *Holism and Evolution* in 1926.

Smyth, Dame Ethel Mary (1858–1944), English composer, the daughter of a general, and a militant suffragette. She studied in Germany, where her most important opera *The Wreckers* was first produced. She also wrote chamber music, a comic opera *The Boatswain's Mate*, and a *Mass in D*.

Snyders, Frans (1597–1657), a great Flemish still-life and animal painter who studied under Breughel.

Soane, Sir John, R.A. (1753–1837), an eminent architect who designed numerous public buildings. By his will he left his museum, library, pictures, etc., for the use of the public, and the house in which he lived at Lincoln's Inn Fields still constitutes the Sir John Soane Museum.

Sobieski, John III. (1624–96), King of Poland from 1674, and heroic defender of his country from Cossacks, Tartars, and Turks.

Socinus, Laelius (1525–62), an Italian Protestant thinker and anti-Trinitarian, founder with his nephew Faustus Socinus (1539–1604), of the Socinian system of theology.

Socrates (470–399 B.C.), Greek philosopher and great intellectual leader, was the son of a sculptor and for some time followed that calling himself, but, having other ambitions, joined the army, and was present at the battle of Potidaea, and also at the battle of Delium, saving the life of Alcibiades in the first, and of Xenophon in the second. Returning to Athens he devoted himself to study and began to exhort the people on public questions and the conduct of life. Socrates wrote nothing himself, but we know of his teachings through the writings of his pupils Xenophon and Plato. In 399 B.C. he was charged with impiety and with corrupting the morals of the young, found guilty, and sentenced to death, events immortalised in Plato's *Apology*, *Crito*, and *Phaedo*.

Soddy, Frederick, M.A., LL.D., F.R.S. (1877–1956), Prof. of Inorganic and Physical Chemistry, Univ. of Oxford, 1919–36. Nobel Laureate in Chemistry 1921. The foundation of the isotope theory was laid by him in Glasgow about 1912 before the physicists became prominent in that field.

Soldatov, Alexander (b. 1917), Soviet diplomat, succeeded J. Malik as ambassador to Britain, 1960.

Solon (638–558 B.C.), was one of the Seven Sages of Greece, and became an eminent legislator, after having made a reputation as a poet. Solon's Laws were so highly esteemed that they were adopted by the Romans in the Twelve Tables.

Solyman (1490–1566), the celebrated Ottoman Sultan known as "the Magnificent," who won fame as a conqueror, law-giver, administrator, and patron of learning.

Somerset, 1st Duke of (1506–52), was Protector of England in the early part of the reign of Edward VI., but was deposed from power, tried for felony, and executed. A liberal and tolerant ruler who opposed enclosures and pursued a moderate religious policy.

Sophocles (495–406 B.C.), the famous Athenian dramatist who enjoyed the highest popularity at Athens, and in a contest with Æschylus was crowned the victor. Of the 100-odd plays of Sophocles only seven have survived: *Antigone*, *Electra*, *Œdipus*, *Ajax*, *Trachiniae*, *Philoctetes*, and *Œdipus at Colonus*.

Soult, Marshal Nicolas Jean de Dieu, Duke of Dalmatia (1769–1851), was one of Napoleon's favourite and most capable generals, distinguishing himself in the Swiss and Italian campaigns, and also in the Peninsular War, where he was Wellington's bravest opponent.

Sousa, John Philip (1854–1932), American bandmaster and composer of numerous stirring marches. His father was Portuguese and his mother German.

Southey, Robert (1774–1843), English poet and historian. In 1803 he settled near Keswick to be near Coleridge and became one of the Lake poets. He was made poet Laureate in 1813. His best work was in prose: histories of Brazil and of the Peninsular War; life of Nelson, and biographies of Wesley and others.

Southwell, Robert (1561–95), a famous Jesuit and religious poet of Elizabethan times. Beatified in 1929.

Spaak, Paul-Henri (b. 1899), Belgian statesman; first President of the U.N. General Assembly in 1946 and of the Assembly of the Council of Europe during its first session in 1949. Sec. Gen. of NATO, 1957–61.

Spaatz, General Carl Andrew (b. 1891), American soldier who held high commands in Europe, North Africa, and the Pacific, 1942–46.

Spartacus, a Thracian who became a Roman slave and gladiator in Capua, and headed an insurrection in Italy in 73 B.C. The slaves he raised routed several Roman armies, but he was eventually defeated by Crassus in 71 B.C. and slain.

Speke, Capt. John Hanning (1827–64), was the discoverer, along with Lt.-Col. J. A. Grant, of the Kagera, the main source of the White Nile, in 1862. In 1856 he discovered Lake Tanganyika and in 1858 Victoria Nyanza.

Spence, Sir Basil, O.M. (b. 1907), architect of the new Coventry cathedral, the university of Sussex, Glasgow air terminal, Hampstead civic centre, and the new British embassy in Rome. Prof. of Architecture, Royal Academy.

Spencer, Herbert (1820–1903), was the son of a Derby schoolmaster. For some time followed the profession of civil engineer. His first book was published in 1851, under the title of *Social Statics*, when he was filling the position of sub-editor of the *Economist*. In 1855 his *Principles of Psychology* appeared, in which he seems to have anticipated Darwin's theory of Evolution. The *System of Synthetic Philosophy* began to appear in 1860, and the last of its ten volumes was issued in 1896.

Spencer, Sir Stanley, C.B.E., R.A. (1891–1959), British artist whose work shows great visionary and spiritual power. His paintings include the Resurrection pictures and the Cookham Regatta series.

Spenser, Edmund (1552–99), was born in London, educated at Cambridge, and early attracted notice by his poetic writings. After the publication of his *Shephearde's Calendar*, he was made known to Queen Elizabeth, and in 1580 received the appointment of Secretary to the Lord Deputy of Ireland, and in the division of confiscated lands that afterwards took place, Spenser received Kilcolman Castle and 3,000 acres of land. Here he wrote his *Faerie Queene*. In 1598 a rebellion broke out, and Spenser's castle was burned to the ground. He then returned to London, and there died.

Spinoza, Baruch or Benedict (1632–77), one of the greatest of modern philosophers, was born at Amsterdam, the son of a Portuguese Jew who had settled there as a merchant. He had a sceptical turn of mind and having expounded philosophical doctrines antagonistic to Judaism, was excommunicated by the rabbis as a heretic. He owed much to Descartes and in 1663 published his work on the Cartesian philosophy. The attainment of truth was his one object in life. Indifferent to money, he spent his life in study and earned his living as a lens grinder. His writings have had an extensive and enduring influence though during his lifetime some of his works, including his *Ethics*, were not allowed to be published. *See also* J20(1).

Spofforth, Reginald (1770–1827), a writer of glees, including *Hail, Smiling Morn*.

Spurgeon, Rev. Charles Haddon (1834–92), a renowned Baptist who preached at The Tabernacle, near the Elephant and Castle, London, from 1861 until his death.

Staël, Madame de (Anne Louise Germaine Necker, Baronne de Staël-Holstein) (1766–1817), the daughter of Necker, the famous Finance Minister under Louis XVI., was married to Baron de Staël (Swedish Minister) at twenty. She was a brilliant woman, deeply imbued with philosophical sentiments. Two years after her marriage she made a considerable impression by her *Letters on Rousseau*, and was regarded as in sympathy with the Revolution. Later on, however, she was in disfavour, first with the Revolutionary leaders, and then with Napoleon, and was in turn exiled by both and during this time wrote *Corinne* and other able works.

Stalin, Generalissimo Joseph Vissarionovich (Djugashvili) (1879–1953), Soviet statesman who for nearly thirty years was leader of the Russian people. Studied for the priesthood at the Tiflis theological seminary. From the age of 17 was an active revolutionary and took important part in the civil war after 1917. After the death of Lenin became the outstanding figure in Russia and his aim to make Russia a great industrial power was carried into effect by modernizing agriculture on socialist lines and by a series of five-year plans, the first of which was introduced in 1929. Assumed military leadership against the German invasion, June 1941. Attended the Allied war conferences at Teheran, Yalta, and Potsdam. The denunciation of Stalin and the "personality cult" by M. Khrushchev at the Soviet Communist Party Congress in Feb. 1956 led to profound and far-reaching political consequences in Communist countries.

Stanford, Sir Charles Villiers, Mus. D. (1852–1924), Professor of Music at Cambridge University, and Professor of Composition and Orchestral Playing in the Royal College of Music. An organist and conductor of remarkable ability, and a composer of much fine instrumental choral, operatic, and other music.

Stanley, Sir Henry Morton, G.C.B., (1841–1904), British explorer, after an adventurous early career during which he fought for the Confederates in the American Civil War, joined the *New York Herald* as a correspondent in 1867 and was commissioned by Gordon Bennett to search for Livingstone. In 1871 he discovered the great missionary at Ujiji and with him explored the northern end of Lake Tanganyika. After further exploration he founded the Congo Free State in 1879. Among his books were *How I found Livingstone*, *Through the Dark Continent*, *In Darkest Africa*, and an *Autobiography*.

Steele, Sir Richard (1672–1729), b. in Dublin, founder of *The Tatler*, which made a great hit, his friend Addison contributing many papers. Two years later he and Addison were associated in *The Spectator*, Addison, however, being the leading contributor; the *Guardian* was another of Steele's ventures. He sat in Parliament for some time, and was knighted by George I.

Steer, Philip Wilson, O. M. (1860–1942), was the most distinguished of British landscape painters, and a fine portraitist.

Stefansson, Vilhjalmur (b. 1879), a famous Arctic explorer, born in Manitoba of Icelandic parents. Took part in the Anglo-American (1908–12) and Canadian (1913–18) Arctic expeditions.

Stein, Sir Aurel, K.C.I.E. (1862–1943), was a famous British archæologist who conducted expeditions, chiefly to Chinese Turkestan, resulting in priceless additions to the British Museum and the Delhi Central Indian Museum. Explored Baluchistan, 1926–28, and South Iran, 1932–33. Was Superintendent of Archæological Survey, North-West Frontier Circle, India, 1910–29.

Stendhal, *nom de plume* of the French novelist, **Marie Henri Beyle** (1783–1842), who has been an important influence in the development of the French novel and whose books show searching psychological insight. Best known for his two novels, *Le Rouge et le Noir*, and *La Chartreuse de Parme*.

Stephen (1105–54) was King of England from 1135 to his death, usurping the crown that belonged to Matilda, the daughter of Henry I.

Stephen Sir Leslie, K.C.B. (1832–1904), an eminent writer, critic and biographer. Edited the *Cornhill Magazine* (1871–82), and the *Dictionary of National Biography* (1882–91). He was the father of Mrs. Virginia Woolf.

Stephenson, George (1781–1848), was born at Wylam, near Newcastle, and up to 1804 was mainly engaged in ordinary colliery occupations. In 1804, however, an engagement as brakesman at Killingworth colliery brought him in touch with the working of Watt's steam engine, and his first efforts in invention were in improving one of those engines, showing so much ability that he was offered an engine-wright's position at Killingham, which he held for some time. Then it was that he began to think seriously of producing a locomotive engine, and managed to construct an engine that would draw coal trucks at the rate of four miles an hour. In 1821, when the Stockton and Darlington Railway was undertaken, he was appointed engineer, and when the railway was opened in 1825, as a line for the transport of coal only, Stephenson won his first great triumph, by putting a locomotive on the line that was able to draw a train of thirty-eight carriages, laden with goods and passengers, at a rate of twelve miles an hour. George Stephenson, subsequently, assisted by his son Robert,

constructed the Liverpool and Manchester line, and after that the railway era commenced. His only son **Robert** (1803–59) attained eminence as a civil engineer and constructed many railway lines and bridges, notably the high level bridge at Newcastle, the Menai and Conway tubular bridges, the Victoria bridge across the St. Lawrence at Montreal, and two bridges over the Nile at Damietta.

Sterne, Laurence (1713–68), British humourist whose *Tristam Shandy* (1759–67) brought him fame. He also wrote *The Sentimental Journey* and published some volumes of sermons.

Stevenson, Adlai Ewing (1900–65), American lawyer and politician; Ambassador to U.N., 1960–65; Gov. of Illinois, 1949–53; Democratic candidate for Presidency, 1952 and 1956.

Stevenson, Robert, F.R.S.E. (1772–1850), a native of Glasgow, famed as a builder of lighthouses, including that on Bell Rock. He invented the "flashing" system of throwing light at sea.

Stevenson, Robert Louis (1850–94), was the Scottish author of a remarkable series of essays, stories, and poems, including *Travels with a Donkey*, *Virginibus Puerisque*, *Treasure Island*, *Kidnapped*, *Dr. Jekyll and Mr. Hyde*, and *A Child's Garden of Verses*. He always suffered from delicate health and travelled extensively, finally settling in Samoa with his Californian wife, formerly Mrs. Osbourne. His literary influence was considerable, particularly on the generation which followed him.

Stinnes, Hugo (1870–1924), German industrialist who built up a huge coal-mining, iron and steel, and transport business, and also developed a large shipping concern. His group controlled the greater part of Germany's coal, iron and steel supply. In 1920 he entered the Reichstag, and later became a newspaper proprietor.

Stirling, Elizabeth (1819–95), English organist whose recitals in London exercised much influence and made Bach's music more widely known. She wrote the part-song "All among the barley."

Stoker Bram (Abraham) (1847–1912), b. in Ireland, author of *Dracula* and *Personal Reminiscences Of Henry Irving*, which records his association with the actor in managing the Lyceum Theatre.

Stokes, Sir George Gabriel, L.L.D., F.R.S. (1819–1903), Irish mathematician and physicist; Prof. of Mathematics at Cambridge from 1849; served as Sec. (1854–85) and as Pres. (1885–92) Royal Society, and as Pres. British Association (1869). Renowned for his researches in hydrodynamics and the theory of light.

Stopes, Marie Carmichael, D.Sc., Ph.D., F.L.S., F.R.S. (1880–1958), woman scientist who published many influential works on birth control and eugenics, and pioneered birth-control clinics.

Stowe, Harriet Elizabeth Beecher (1811–96), authoress of *Uncle Tom's Cabin* which exposed the horrors of slavery and did much to advance the cause of abolition.

Strachey, Rt. Hon. Evelyn John St. Loe (1901–63), English writer and politician; served in Attlee's cabinet, 1945–51. Author of lucid and vigorous books on the principles of democratic socialism. Son of the journalist John St. Loe Strachey and cousin of Giles Lytton Strachey, the biographer.

Stradivari, Antonio (1644–1730), an Italian maker of violins, b. Cremona, first in his art.

Strafford, Thomas Wentworth, Earl of (1593–1641), the distinguished statesman, sent by Charles I. to Ireland as Lord Deputy in 1631. Was the founder of the Irish linen manufacture. He obtained the name of "Thorough" by his sweeping measures for asserting the King's authority, but was ultimately impeached on a variety of charges, found guilty, and executed.

Strauss, David Friedrich (1808–74), German theological writer, who made a great stir in the religious world by his *Life of Jesus*, published in 1835, which attempted to prove that the evangelical history rested on a series of myths.

Strauss. Family of Viennese musicians. **Johann Strauss** (1804–49), "the elder," was a composer of dance music who with Joseph Lanner established the Viennese waltz tradition. His son, **Johann Strauss** (1825–99), "the younger," although not so good a violinist or conductor as his father, is the more famous as the composer of over 400 waltzes, which include *The Blue Danube* and *Tales from the Vienna Woods*. Two of his brothers **Joseph Strauss** (1827–70) and **Eduard Strauss** (1835–1916) were also composers and conductors.

Strauss, Richard (1864–1949), German composer and conductor, the son of a horn player in the opera orchestra at Munich. He succeeded von Bülow as court musical director at Meiningen. Among his compositions which are widely acclaimed are the operas *Salome*, *Elektra*, and *Der Rosenkavalier*, the symphonic poems *Don Juan*, *Till Eulenspiegel*, and *Don Quixote*, and many songs of great lyrical beauty. *See* Section E.

Stravinsky, Igor (b. 1882), Russian composer and conductor, pupil of Rimsky-Korsakov. His ballets, *The Fire Bird* (1910), *Petruska* (1911), representative of his early romantic style, and the revolutionary *The Rite of Spring*, which caused a furore when it first appeared in 1913, were written for the ballet impressario Diaghilev. He adopted a neo-classical style in later works, for example, in the ballets *Pulcinella* and *Apollo Musagetes*, and the opera-oratorio *Oedipus Rex*. Younger composers have been much influenced by his music. He became a French citizen in 1934, and a U.S. citizen in 1945. *See* **Section E.**

Strindberg, Johan August (1849–1912), Swedish writer of intense creative energy. His work is subjective and reflects his personal conflicts. He married three times but never happily. He produced some fifty-five plays as well as novels, stories, poems, and critical essays. *Lucky Peter*, *Gustav Adolf*, *Till Damascus*, *The Father*, *Miss Julie* are some of his plays.

Strong, Leonard Alfred George (1896–1958), poet, novelist, short story writer, and critic. Author, among other books, of *Dublin Days*, *The Brothers*, and *The Last Enemy*.

Stuart, Arabella (1575–1615), daughter of the Earl of Lennox and cousin of James I., whose next heir she was both to the English and Scottish thrones. In 1610 she married William Seymour, afterwards Earl of Hertford and Duke of Somerset, and thereby incurring the king's displeasure, she was incarcerated in the Tower of London, where she died insane.

Suckling, Sir John (1609–42), wit, courtier, and poet; served under Gustavus Adolphus and in Charles I's first Scottish war (1639). Being concerned in a plot to rescue the Earl of Strafford from the Tower, he fled to France, where he may have killed himself. He wrote poems, ballads, songs, and prose work and is said to have invented cribbage.

Sudermann, Hermann (1857–1928), German dramatist, poet and novelist. His brilliant novel, *Frau Sorge* (1887), translated into English as *Dame Care* (1892), reached its 125th edition in 1912. From 1890 he produced a succession of realistic plays and novels.

Sullivan, Sir Arthur Seymour, C.V.O. (1842–1900), gifted composer, gained his first musical experiences as choir-boy at the Chapel Royal, and later studied at Leipzig. He composed oratorios but at the same time cultivated a lighter vein with pronounced success. Became famous for the light operas written in collaboration with W. S. Gilbert, which include *Trial by Jury*, *The Sorcerer*, *H.M.S. Pinafore*, *Pirates of Penzance*, *Patience*, *The Mikado*, *The Yeomen of the Guard*, *The Gondoliers*.

Sully, Maximilien de Béthune, Duc de (1560–1641), a French Protestant statesman, a friend and companion of Henry of Navarre. His *Memoirs* made notable reading.

Sun Yat Sen, Dr. (1867–1925), Chinese revolutionary, founder and first President of the Chinese Republic, 1912, resigning almost immediately in favour of Yuan Shih-kai. Was the first graduate of medicine at Hongkong, 1891. Founded in 1905 the China Revolutionary League in Europe and Japan, and played a large part in the revolution of 1911, which overthrew the Manchu Dynasty. *See also* **Section C, Part I.**

Sutherland, Graham Vivien, O.M. (b. 1903), British artist; he painted the 80th birthday portrait of Sir Winston Churchill commissioned by Parliament and designed the vast tapestry for Coventry Cathedral.

Sutro, Alfred (1863–1933), author and dramatist.

His most successful plays were *The Walls of Jericho* (1904) and *John Glayde's Honour* (1907).

Swedenborg, Emanuel (1689–1772), Swedish philosopher, scientist, mystic. In later life he announced that Divine authority had been given him to explain natural and spiritual evidences. He published in quick succession *Arcana Coelestia, The Apocalypse Revealed, Four Preliminary Doctrines*, and *The True Christian Religion*. He also claimed that his soul had been permitted to travel into hell, purgatory and heaven. His works became the scriptures of the sect named Swedenborgians.

Sweelinck, Jan Pieterszoon (1562–1621), famous Dutch organist and composer of sacred music. In his fugues he was the first to make independent use of the pedals, and thus prepared the way for Bach.

Swift, Jonathan (1667–1745), the greatest English satirist, b. in Dublin of English parents, author of *A Tale of a Tub* and *The Battle of the Books* (1704) and *Gulliver's Travels* (1726), works unmatched in satirical power. He crossed to England in 1688 to become secretary to Sir William Temple, took orders in the Church of England when he was 27, but the promotion he hoped for did not come. He was active in Whig politics but changed to Tory in 1710, writing powerful political tracts, notably *The Conduct of the Allies* (1711). He retired to Ireland in 1714 as Dean of St. Patrick's. Both his devoted women friends followed him there—Hester Johnson (d. 1728), the Stella of his famous *Journal*, and Esther Vanhomrigh (d. 1723), the Vanessa of his poetry. It was during the last 30 years of his life that his greatest work was written. *The Drapier's Letters*, in which he exposed the misery of the Irish people under English rule and articulated their feelings for them, made Irishmen worship him. He was buried at St. Patrick's beside Stella.

Swinburne, Algernon Charles (1837–1909), was educated at Oxford, and in the early 'sixties of last century gave to the world a number of poems of singular poetic beauty and musical charm, which procured him a high rank among English poets. Swinburne's most famous productions include *Atalanta in Calydon, Songs before Sunrise, Bothwell*, and *Mary Stuart*. Perhaps the best of his writings is his essay on William Blake.

Swithin, St. (*circa* 800–862), Bishop of Winchester in 852, and on the translation of his remains to a shrine in the interior of the cathedral from the graveyard, fixed for July 15th, 971, violent rain intervened, and, it is said, continued for forty days; hence the superstition as to rain upon St. Swithin's Day.

Symonds, John Addington (1840–93), acquired fame as a poet and writer on *The Renaissance Period in Italy*.

Synge, John Millington (1871–1909), Irish poet and playwright. His best known work, *The Playboy of The Western World*, met with a hostile reception when first produced in Dublin in 1907, but English audiences were at once enthusiastic.

Szymanowski, Karol (1883–1937), Polish composer and director of the Conservatoire at Warsaw.

T

Tacitus, Caius Cornelius (55–*circa* 120). His chief claim to remembrance is that he was one of the ablest of Roman historians, and left behind him a number of works; among them a life of Agricola and his *Annales*, which have formed the ground-work of much that has since been written on the period he covered.

Tacitus, Marcus Claudius (205–276), the Roman Emperor who succeeded Aurelian in A.D. 275. His short reign was wise and marked by moderation.

Taft, Wm. Howard (1857–1930), Chief Justice United States 1921–30. President of the United States 1908–13.

Tagore, Rabindranath (1861–1941), a Bengal poet who won the Nobel Literature Prize in 1913.

Talbot, William Henry Fox, F.R.S. (1800–1877), English scientist who first discovered the principles of photography in 1833. Inventor of the calotype or Talbot-type process of which modern photography is a development.

Talleyrand-Périgord, Charles Maurice de (1754–1838), French politician and diplomat, led a mission to England in 1792 and was Foreign Minister from 1797 until 1807. He represented France at the Congress of Vienna.

Tallis, Thomas (*c.* 1510–85), a distinguished musician, who was, as organist, attached to the Chapel Royal under Henry VIII., Edward VI., Mary, and Elizabeth, and was the composer of some of the finest of our Church music.

Tamerlane or Timur Lenk (= Timur the Lame) (1336–1405), Mongol conqueror who turned his energies from deliverance of his people from barbarism to military conquest for its own sake. He made himself ruler of Samarkand in 1369 and in a series of campaigns conquered Iran, Transcaucasia, Iraq, Armenia and Georgia, invaded India and Syria, and defeated the Ottoman Turks at Angora. While preparing for the invasion of China death overtook him. His reputation is that of a ruthless and cruel conqueror who showed no mercy even to his fellow Moslems, but he was also a patron of literature and the arts. The Timurids are the line of rulers descended from him.

Tannhäuser, a mythical German minnesinger of the 13th century, who belonged, according to the legend handled so romantically in Wagner's opera, to the Salzburg family of Tanhusen, and was the beloved of Lisaura.

Tarkington, (Newton) Booth (1869–1946), American novelist whose best-known book is *Monsieur Beaucaire*, a sentimental romance which he successfully dramatised.

Tarquin Superbus (or "the Proud"), the last King of Rome. Was banished 510 B.C. After his deposition came the Consuls.

Tarquin the Elder, 5th King of Rome, succeeded Ancius Mastius 615 B.C., reformed the laws, embellished the city, and was assassinated.

Tartini, Giuseppe (1692–1770), great violinist and anticipator of romanticism in Italian music. In practising double stops he discovered a differential tone which modified the intonation—becoming known as Tartini's or "the third" tone—a scientific explanation of which was later given by Helmholtz. His best-known sonata is *The Devil's Trill* written after a dream in which the devil played to him.

Tasman, Abel Janszoon (*circa* 1602–59), a famous Dutch navigator; in 1642 he discovered Tasmania and New Zealand shortly thereafter.

Tassigny, Jean de Lattre de, Marshal of France, Hon. G.C.B. (1890–1952), outstanding commander of the Free French Movement in Second World War; High Commissioner and C.-in-C. Indo-China, 1950–52. C.-in-C. Land Forces, Western Europe, 1948–50.

Tasso, Torquato (1544–95), one of the great Italian epic poets, author of *Jerusalem Delivered* (Ital. *Gerusalemme liberata*) which celebrates the First Crusade.

Tawney, Richard Henry, B.A. (1880–1962), great historian, pioneer of adult education, leader of socialist thought, the first critic of the affluent society; Prof. Emeritus Economic History, Univ. of London, 1931–49. Among his standard works are *The Acquisitive Society, Equality, Religion and the Rise of Capitalism*.

Taylor, Jeremy (1613–67), an English divine of great influence. The most famous of his works was his *Holy Living and Holy Dying*.

Tchaikovsky, Peter Ilich (1840–93), Russian composer. His music is melodious and intensely emotional and he excelled in several branches of composition. Amongst his works are ten operas, including *Eugene Onegin* and *The Queen of Spades* (both from stories by Pushkin), seven symphonies, including *Manfred*, the *Little Russian* and the *Pathétique*, his last completed work, ballets, including *Swan Lake, The Sleeping Beauty*, and *The Nutcracker*, the fantasies *Romeo and Juliet* and *Francesca da Rimini*, the piano concerto in B flat minor, the violin concerto in D, and numerous songs. *See* Section E.

Tedder, Marshal of the R.A.F., Arthur William, 1st Baron, G.C.B. (1890–1967), was Deputy Supreme Commander under Eisenhower for the invasion of Europe, Chief of the Air Staff, 1946–48; Chairman, Western Europe Chiefs of

Staff committee, 1948–50; Vice-Chairman of the Governors of the B.B.C., 1952–54; Chancellor Univ. of Cambridge, 1950–67.

Telemann, Georg Philipp (1681–1767), composer of great facility and output in all fields of music. Founded Collegium Musicum at Leipzig Univ. and held appointments in many other German towns, including Hamburg. His music has vitality and originality of form and is appreciated today after long period of neglect.

Telford, Thomas (1757–1834), was a Scottish working stone-mason who became a great engineer and attained special fame as a builder of bridges, the Menai Suspension Bridge being, perhaps, his greatest work. He constructed the Ellesmere Canal, made many hundreds of miles of difficult mountain roads, was chief engineer of the Caledonian Canal, and altogether did an immense amount of public work.

Tell, William, a legendary figure in Swiss folk-lore. The story of his having been compelled by order of the imperial governor, Gessler, to shoot an apple from the head of his own son and his dramatic revenge is regarded as a legendary feat which has its origins in Teutonic myth. The Swiss hero of the Uri, however, played a great part in freeing his country from the Austrian yoke in the early part of the 14th century.

Temple, Most Rev. Frederick (1821–1902), a famous Anglican Churchman who became Headmaster of Rugby in 1858; in 1860 attained notoriety as the author of the first of the much-controverted *Essays and Reviews*, advocated the disestablishment of the Irish Church in 1868, was appointed Bishop of Exeter in 1869, translated to London in 1885, and in 1896 was raised to the Primacy. He made a strong Archbishop, and dominated the Church with his vigorous personality.

Temple, Most Rev. William, P.C., D.Litt., D.D. (1881–1944), one of the outstanding Christian leaders of his time and the son of Frederick Temple, was Archbishop of Canterbury, 1942–44, after being Headmaster of Repton, 1910–14, Bishop of Manchester, 1921–29, and Archbishop of York, 1929–42. His influence was felt among Christians of all denominations, and he strove for the unity of the Churches.

Temple, Rt. Hon. Sir William, Bt. (1628–99), English statesman and author; Ambassador to The Hague in Charles II.'s time, and instrumental in bringing about the marriage between William of Orange and the Princess Mary. William III. twice offered him the position of Secretary of State, but he declined the honour, spending the years of his retirement at Moor Park (where Swift served him for a time as private secretary). Married Dorothy Osborne (1627–95), the letter-writer.

Templewood, Samuel John Gurney Hoare, 1st Viscount, P.C., G.C.S.I., G.B.E., C.M.G. (1880–1959), Conservative politician; Sec. of State for Air, 1922–29; Sec. of State for India, 1931–35; Foreign Sec., June–Dec. 1935; Home Sec., 1937–39; Special Ambassador to Spain, 1940–44.

Teniers, David (the younger) (1610–94), was born at Antwerp, and his paintings of the old rustic Flemish life are unsurpassed in their humour and fidelity. He died at Brussels. His father, David Teniers the elder (1582–1649), was also one of the leading landscape painters of the time.

Tenniel, Sir John (1820–1914), for over fifty years leading artist of *Punch*, illustrated numerous books, including *Alice in Wonderland*.

Tennyson, Alfred Lord (1809–92), was Poet Laureate from 1850 to his death. Born at Somersby, in Lincolnshire, he showed poetic gifts while quite young, and in 1827, joined his brother Charles in the publication of *Poems by Two Brothers*. In 1847 he published *The Princess*; in 1850 *In Memoriam*, a poem of great beauty and depth of thought, in which he enshrined his affection for the memory of his dead friend Arthur Hallam; and in 1855 *Maud* appeared. His other works include *The Idylls of the Kings*, *Enoch Arden*, *Queen Mary*, *Harold*, and *Becket*.

Terence, Publius Terentius Afer (*c.* 184–159 B.C.), a Latin poet and dramatist, an African (Berber), who rose from the position of a slave to that of one of the most honoured men in Rome.

Teresa, St., or Theresa (1515–82), a Spanish saint and author, born at Avila, entered the Carmelite order in 1534, established a reformed order in 1562, became famous for her ascetic life and mystic visions, and died at Alba de Liste. Her religious writings include *The Way of Perfection* and *The Castle of the Soul*. She was canonised by Pope Gregory XV.

Terry, Dame Ellen, G.B.E. (Mrs. James Carew) (1848–1928), one of the most distinguished of English actresses. Played Shakespeare with Sir Henry Irving at the Lyceum and later appeared in plays of Bernard Shaw.

Tertullian, Quintus (*circa* 150–230), a Father and writer of the Latin Church. His chief work was his *Apologeticus*, a defence of Christianity.

Tetrazzini, Luisa (1871–1940), an Italian prima donna who sprang into prominence in 1907 by her wonderful singing at Covent Garden and hailed as a second Patti.

Tetzel, John (*c.* 1460–1519), the German Dominican monk and Inquisitor, the scandal of whose sale of indulgences roused Luther to publish his ninety-five theses at Wittenberg in 1517.

Thackeray, William Makepeace (1811–63), English novelist, author of *Vanity Fair*, *Pendennis*, *Esmond*, *The Newcomes*, *The Virginians*, *Philip* and *Lovel the Widower*. He edited the *Cornhill Magazine* from the first number, January, 1860, for a few years his most notable contributions being his *Roundabout Papers*.. His *Yellowplush Papers* and *The Book of Snobs* (republished from *Punch*) were widely read and admired; and the lectures he delivered in America on *The Four Georges* were pungently powerful.

Thales of Miletus (*c.* 624–565 B.C.), earliest of the Greek scientists, he created a sensation by his prediction of an eclipse of the sun, which was visible at Miletus in 585 B.C. He looked upon water as the basis of all material things and in his mathematical work was the first to enunciate natural laws.

Thant, Sithu U (b. 1909), Secretary-General of the United Nations, 1962– ; Acting Sec.-Gen. after Dr. Hammarskjöld's death in 1961; Burmese Perm. Rep. to U.N. 1957–61.

Themistocles (*c.* 514–449 B.C.), Athenian soldier and statesman. By fortifying the harbour of Piræus as the port of Athens, by the remission of taxes on aliens, and by the creation of the Athenian navy, he established Athenian prosperity and made possible the later Athenian empire. Defeated the Persian fleet at Salamis in 480 B.C.

Theocritus (285–247 B.C.), one of the great Greek poets. Thirty *Idylls* have come down to us and a number of *Epigrams*.

Theodoric the Great (455–526), a celebrated King of the East Goths, born at Pannonia. In mediæval German romance he is known as "Dietrich von Bern," and had a reputation for good government, akin to that ascribed in England to King Alfred. He was the founder of the Gothic Kingdom of Italy.

Theodosius the Great (346–95) was Roman Emperor of the East for nearly twenty years. He gained victories over the Goths, and the year before his death became sole Emperor. Noted in ecclesiastical history for his conversion to Christianity, and for his submission to the penance imposed by St. Ambrose.

Theophrastus (*c.* 372–287 B.C.), succeeded Aristotle as President of the Lyceum at Athens. His *History of Plants* and his *Moral Characters* are the best known of his writings.

Thibaud, Jacques (1880–1953) famous French violinist. Killed in aeroplane crash.

Thierry, Jacques Nicolas Augustin (1795–1856), a distinguished French historian, known by his *History of the Norman Conquest*.

Thiers, Louis Adolphe (1797–1877), a French statesman and man of letters, author of *History of the French Revolution*.

Thomas, Dylan (1914–53), Welsh poet whose *Eighteen Poems* (1934) brought him instant recognition as an original and gifted artist. Other works include *Twenty-five Poems* (1936), *Deaths and Entrances* (1945), *Under Milk Wood*, a play for voices.

Thomson, James (1834–82), a Scottish poet who wrote *The City of Dreadful Night*.

Thomson, Sir (John) Arthur (1861–1933), was a well-known biologist.

Thomson, Sir Joseph (John), O.M., D.Sc., F.R.S.

(1856–1940), physicist and mathematician; Master of Trinity College, Cambridge, 1918–40; Cavendish Prof. of Experimental Physics, Cambridge, 1884–1919. Awarded Nobel Prize in 1906 for his work on conduction of electricity through gases; also discovered the electron. Pres. of the Royal Society, 1913–15. His son, **Sir George Paget Thomson**, (b. 1892) F.R.S., is also a physicist and Nobel Prizeman; former Master of Corpus Christi College, Cambridge.

Thoreau, Henry David (1817–62), American essayist and nature-worshipper. He was the friend of, and for a time lived with, Emerson. Best known for his classic *Walden, or Life in the Woods*.

Thorez Maurice (1900–64), French communist, under whose leadership the Communists became the largest single party in the French elections of 1945 and 1946; Sec.-Gen. of French Communist Party, 1930–64.

Thorndike, Dame Sybil, D.B.E., LL.D. (b. 1885), celebrated British actress who made her début with the Ben Greet players in 1904 and worked with the Old Vic from 1914–18. She won great success in the Greek tragedies, Shakespeare, Shaw, and in Grand Guignol. Both she and her husband, Sir Lewis Casson, received the honorary degree of D. Litt. at Oxford University in 1966 in commemoration of their long and splendid partnership.

Thornycroft, Sir William Hamo, R.A. (1850–1925), English sculptor whose works include the Gladstone Memorial, the statue of General Gordon in Trafalgar Square, of Queen Alexandra in the Royal Exchange, Lord Granville in the Houses of Parliament, Cromwell at Westminster, and John Bright in Rochdale.

Thorpe, Sir (Thomas) Edward, C.B., Ph.D., D.Sc., F.R.S. (1845–1925), a noted English chemist. His chief research work was done on paraffin hydrocarbons, and the derivatives of fluorine and phosphorus. Author of a standard *Dictionary of Applied Chemistry* and a *History of Chemistry*.

Thorwaldsen, Bertel (1770–1844), a famous Danish sculptor.

Thucydides (*c.* 460–399 B.C.), the first scientific historian, was an Athenian and took part in the Peloponnesian War, about which he wrote his *History*. Attempted an impartial account, weighing the testimony of eye-witnesses and keeping to carefully verified facts. The *History* is a graphic narrative, but Thucydides was not merely a chronicler; he saw the general significance of particular events and wished to pass on the political lessons of the past to the future. The speeches which he put into the mouths of the various actors reveal the political ideas and climate of opinion of contemporary Greece, and include the famous Funeral Oration of Pericles.

Tiberius, Claudius (42 B.C.–A.D. 37), the second Emperor of Rome, had an evil reputation but was an able ruler and successful soldier. Spent his later years in Capri.

Tillett, Benjamin (1860–1943), M.P. for North Salford 1917–24 and again 1929–31, came into prominence in the great dock strike of 1889. He was the organiser and secretary of the Dockers' Union; for several years alderman of the L.C.C.; and an active labour leader. Chairman of the General Council T.U.C. 1928–29.

Tillotson, John (1630–94), a celebrated preacher at Lincoln's Inn, "Popery" and "Atheism" being the main objects of his attacks; in 1691 became Archbishop of Canterbury.

Tindal, Matthew (*c.*1653–1733), noted English Deist.

Tintoretto (1518–94), Venetian painter whose aim it was to unite the colouring of Titian with the drawing of Michelangelo. He is among the most original and decorative of artists whose numerous paintings, mostly of religious subjects, were executed with great speed, some of them on enormous canvasses. His real name was Jacopo Robusti, and he was called Il Tintoretto (little dyer) after his father's trade. Three of his six children were painters.

Tippett, Sir, Michael Kemp, Kt., (b. 1905), English composer whose works include Concerto for Orchestra, *Midsummer Marriage*, *King Priam*, the cantata *Boyhood's End*, and the song-cycle *The Heart's Assurance*. *See* Section E.

Titian, or Tiziano Vecelli (1477–1576), one of the greatest of painters. He studied under the Bellinis, and made his first essays in painting for the public in conjunction with Giorgione, whom he soon surpassed. In 1511 he was at Padua, where he painted some notable frescoes; in 1512 he was back in Venice, with a studio on the Grand Canal, employed on important commissions. From this time forward he was in great demand, and exercised his marvellous powers almost to the end of his life, dying of the plague at ninety-nine.

Titiens (or Tietjens), Teresa (1831–77), a famous German operatic prima donna and concert-room singer.

Tito, Marshal (Josif Broz) (b. 1892), Prime Minister of the Federal People's Republic of Yugoslavia since 1945. Leader of the partisan forces which successfully fought against German occupation. President National Liberation Committee, 1943.

Titus (40–81), the Roman Emperor, and son of Vespasian. Attained great renown by his successful part in the Jewish war which terminated in the capture and destruction of Jerusalem; he was deemed a profligate and a tyrant, but no sooner was he in sole power than he exerted himself to the utmost to please the people, completed the Colosseum, built splendid baths, and otherwise made himself popular.

Tizard, Sir Henry Thomas, G.C.B., F.R.S. (1885–1959), scientist and administrator; Pres. British Association, 1948. Played important part in the higher scientific direction of the second world war and as Chair. Advisory Council on Scientific Policy, 1947–52.

Tocqueville, Alexis, Comte de (1805–59), author of *De La Démocratie en Amérique* and *De L'Ancien Régime*, which set out nineteenth-century liberal ideas.

Todd, Alexander Robertus, 1st Baron, D.Sc., F.R.S. (b. 1907), British biochemist; Prof. of Organic Chemistry at Cambridge, 1944– . For his work on the structures of nucleic acids he received the 1957 Nobel Prize for Chemistry.

Tolstoy, Count Leo Nikolayevitch (1828–1910), was the most distinguished personality in modern Russian literature. Born of a good family, he was for a time in the army, but was so greatly moved by the trials and sufferings of the people that, out of pure sympathy of heart, he was impelled "to take up his pen and write." At twenty-four he published his *Childhood*, and in 1854, while in camp in the Crimea, wrote his *Tales from Sebastopol*, which procured him considerable literary fame. Later on he was a persistent advocate of progressive ideas, and, before the Emancipation Act for freeing all Russian serfs was enforced, he himself had given the serfs on his own estate their freedom. In 1862 he married, and settled down to a quiet country life, shortly afterwards publishing his *War and Peace* and *Anna Karenina*. In his latter years Tolstoy developed a sort of religious mysticism. Among his later works are *The Power of Darkness*, *The Kreutzer Sonata*, *The Cossacks*, *Resurrection*, and *The End of the Age*.

Tooke, John Horne (1736–1812), English politician and pamphleteer, was a supporter of Wilkes and later Pitt. His tracts advocated reform. After the French Revolution was tried for high treason, but was acquitted.

Toole, John Lawrence (1832–1906), for half a century a popular English comedian.

Torquemada, Tomás de (1420–98), the chief officer of the Spanish Inquisition.

Torricelli, Evangelista (1608–47), Galileo's pupil. He invented the barometer and improved both the microscope and the telescope.

Toscanini, Arturo (1867–1957), famous Italian conductor, La Scala Theatre, Milan, 1898–1908, and 1920–29; at the Metropolitan Opera House, New York, 1908–15; and of the Philharmonic Symphony Society of New York, 1926–36. Returned to Milan in 1946 after a ten-year exile.

Toulouse-Lautrec, Henri de (1864–1901), French painter, whose pictures portray with stark realism certain aspects of Parisian life in the nineties.

Tovey, Sir Donald Francis (1875–1940), pianist and composer who for 25 years held the chair of music at the University of Edinburgh. Outstanding among his many writings is *Essays in Musical Analysis*, and his compositions include chamber music, a piano concerto, and an opera *The Bride of Dionysus*.

Toynbee, Arnold (1852–83), after graduating at Oxford, devoted himself to practical philanthropy and social reform. From his self-denying efforts sprang the settlement in East London—Toynbee Hall.

Toynbee, Arnold Joseph, C.H., Hon.D.Litt. (Oxford, Cambridge, and Birmingham) (b. 1889), eminent scholar and historian, nephew of above. Dir. of Studies Royal Inst. of Int. Affairs, 1925–55. Major work *A Study of History*.

Trajan (*circa* 52–117) was Roman Emperor from 98 to his death. His rule was enlightened, and he was esteemed by his people.

Tree, Sir Herbert Beerbohm (1852–1917), the London actor-manager who scored successes at the Haymarket and His Majesty's Theatre.

Trenchard, Marshal of the R.A.F., Viscount, G.C.B., O.M., G.C.V.O., D.S.O. (1873–1956), Chief of Air Staff, 1918–29; Commissioner of Police of the Metropolis, 1931–35; often known as the father of the Air Force and largely responsible for the establishment of the R.A.F. College at Cranwell and the Hendon Police College.

Trent, 1st Baron, of Nottingham (Jesse Boot) (1850–1931), founder of Boots Cash Chemists, Ltd.; a great benefactor of Nottingham, especially of the University of Nottingham.

Trevelyan, George Macaulay, O.M., C.B.E. (1876–1962). English historian, son of Sir George Otto Trevelyan and great nephew of Thomas Babbington Macaulay. Regius Professor of Modern History at Cambridge 1927–40; Master of Trinity College, 1940. Chancellor of Durham University, 1949. His chief works are: *History of England*; a trilogy of books on *Garibaldi*; *England under the Stuarts*; *England under Queen Anne*; *Grey of Fallodon*; *English Social History*; *An Autobiography and other Essays*.

Trevelyan, Rt. Hon. Sir George Otto, 1st Bt., O.M. (1838–1928), Liberal statesman and historian. Became Chief Secretary for Ireland in 1882, and was later Secretary of State for Scotland. Wrote a biography of his uncle, Lord Macaulay, which was highly praised. Father of Professor G. M. Trevelyan.

Trevithick, Richard (1771–1833), a Cornish mine-manager's son, who invented the road-locomotive, putting upon the highway on Christmas Eve, 1801, the first steam-propelled vehicle for passengers.

Trollope, Anthony (1815–82), author of many novels. His Barchester series depicts a number of scenes of higher clerical life with great fidelity and success.

Trotsky, Leon, name assumed by Lev Davidovich Bronstein (1879–1940), one of the leaders of the Bolshevist revolution. War Minister of the Bolshevist Government and its leading representative at the Brest-Litovsk conference of 1917–18. He differed from the Communist Party on policy and was dismissed from office in 1925. In 1929 took up exile in Mexico where he was assassinated.

Truman, Harry S. (b. 1884), President of the United States, 1945–53. Inherited the Presidency on the death of Roosevelt in 1945 and won the Pres. election in 1948. He took the historic decision to enter Korea in 1950, dismissed Gen. MacArthur in 1951, and will perhaps best be remembered for his "Point Four" programme of raising levels of living in backward, and under-developed countries.

Tulsi Das (1532–1623), mediæval poet of India whose great masterpiece *Ram-Charit-Mânas* (popularly known as the *Râmayana* and based on the Sanskrit epic of Vâlmiki) is venerated by all Hindus just as the Bible is in the West.

Turenne, Henri de la Tour d'Auvergne, Vicomte de (1611–75), a famous French commander and Marshal of France, who was highly successful in the Thirty Years' War.

Turgenev, Ivan Sergeyvich (1818–83), was a friend of Gogol and Tolstoy, and a famous Russian novelist and short-story writer. His works were frequently satirical and directed against the oppression of the peasants by the nobles. Was the inventor of the term "nihilist" to describe the Russian anarchist movement.

Turner, Joseph Mallord William, R.A. (1775–1851), was the son of a London barber, but while quite a child showed the possession of artistic genius. In 1789, after some miscellaneous schooling, he entered the Royal Academy classes, and soon began to make headway. Of his larger pictures may be mentioned *The Sun Rising through Vapour*, *Crossing the Brook*, *Dido Building Carthage*, *The Fighting Téméraire*, and *Calais Pier*. Ruskin, in his *Modern Painters*, wrote with great eloquence and critical insight regarding Turner's work, and brought about a fuller appreciation of his genius. Turner never married, and took little interest in anything outside his art. He left the oil paintings and drawings he had preserved to the National Gallery.

Tussaud, Madame Marie (1760–1850), a Swiss who while practising the art of modelling wax in Paris at the time of the French Revolution, made her escape to England and set up a small exhibition of wax figures in the Strand, later carried on by her son, grandson and great-grandson at Baker Street and in 1884 transferred to Marylebone Road.

Tut-ankh-amen (*circa* 1350 B.C.), an Egyptian Pharaoh of the 18th dynasty, whose tomb was discovered by Howard Carter in 1922, with the mummy and gold sarcophagus intact. The magnificence of the objects found aroused world-wide interest.

Twain Mark. (*See* **Clemens, Samuel L.**)

Tweedsmuir, John Buchan, 1st Baron, C.H. (1875–1940), Gov.-Gen. of Canada 1935–40, journalist, politician, and author, wrote numerous biographies, historical novels, and adventure stories, including *Montrose*, *The Path of the King*, *Greenmantle*, and *Sick-Heart River*, and an autobiography *Memory Hold the Door*.

Tyler, Wat (d. 1381), the leader of the peasants' revolt of Richard II.'s time against the iniquitous poll-tax. Over 100,000 peasants followed Tyler into London in June 1381, and the king met them in Smithfield and made promises of redress that were never fulfilled. It was at this meeting that Sir William Walworth, Lord Mayor of London, stabbed Tyler to death.

Tyndale, William (*c.* 1492–1536), was educated at Oxford, and conceived a strong desire to be the medium of presenting the Bible to his countrymen in their own language. He completed the translation of the New Testament at Wittenburg, where he was associated with Luther. This version was first published at Antwerp, and then found its way to England, where it was publicly burnt at St. Paul's Cross. Tyndale afterwards was associated with Miles Coverdale in a translation of the Old Testament, but only completed the Pentateuch and the book of Jonah. Antwerp was Tyndale's retreat during this later period, and in 1535 he was arrested for heresy and put to death by strangling and burning.

Tyndall, Prof. John, F.R.S. (1820–93), was an eminent scientist. His books on light, sound, and heat are well-known text-books.

U

Unamuno, Miguel de (1864–1936), Spanish philosopher, poet, essayist, and novelist, author of *El Sentimiento Tragico de la Vida* (The Tragic Sense of Life).

Ulanova, Galina (b. 1910), Russian ballet dancer, made her début in 1928 and is the world's greatest living exponent of the art. She danced in Florence in 1951 and in London in 1956.

Undset, Sigrid (1882–1949), Norwegian novelist, daughter of a distinguished Norwegian antiquary, from whom she derived her knowledge of life in ancient and mediaeval Norway. Her first success came with *Jenny* (1911), and the great works based on mediaeval history, *Kristin Lavransdatter* (1920–22) and *Olav Audunsson* (1925–27), won for her the 1928 Nobel Prize for Literature.

Unwin, Sir Raymond (1863–1940), English architect and expert on Town Planning, who became known as the architect of the first garden city at Letchworth, and of the Hampstead Garden Suburb.

Ursula, St., is said to have been an English princess, who with 11,000 virgins set out on a pilgrimage, but compelled by a fierce storm to take refuge in Cologne, was there put to death with her following by an army of Huns.

Usher or Ussher, James (1581–1656), Irish prelate and scholar, one of the most distinguished

theologians of his day. He worked out a system of dates setting the creation at 4004 B.C.

Valentine, St., was a Christian martyr of the reign of the Emperor Claudius II (d. 270 A.D.). His festival was commemorated on February 14 before Gregory the Great's time. The custom of sending valentines had its origin in a heathen practice associated with the worship of Juno about this date in the calendar, and had no connection with the saint.

Vanbrugh, Sir John (1664–1726), was a prominent architect as well as a successful dramatist.

Vancouver, George (1758–98), a British navigator who served under Captain Cook and later explored the Gulf of Georgia and the Straits of San Juan de Fuca, as also the shores of Vancouver Island.

Vanderbilt, Cornelius (1794–1877), a noted American merchant and railway speculator who accumulated a fortune of twenty millions sterling. His son William Henry Vanderbilt (1821–85) inherited and added to it.

Van Dyck (or Vandyke), Sir Anthony (1599–1641), was born at Antwerp, and after studying under Rubens went to Italy and there made a name as a portrait painter. In 1629 he came to England on the invitation of Charles I., but remained only a short time; in 1631 Charles prevailed upon him to return, made him a knight, granted him an annuity, and he became the Society painter of the day.

Vane, Sir Henry (1613–62), was a prominent statesman and diplomatist. At the Restoration he was arrested as an enemy of the State and ultimately beheaded on Tower Hill.

Van Gogh, Vincent (1853–1890), Dutch painter of some of the most colourful pictures ever created. With passionate intensity of feeling he painted without pause whatever he found around him—landscapes, still-lifes, portraits; his was a truly personal art. His life was one of pain, sorrow and often despair and in the end he committed suicide.

Van Loon, Hendrik Willem (1882–1944), Dutch-American historian, born in Rotterdam, who became famous in 1922 with the publication of *The Story of Mankind*, a picture history-book originally intended for children.

Vauban, Marshal Sebastien le Prestre de (1633–1707), a renowned French military engineer who introduced great improvements in methods of fortification, conducted fifty-three sieges, and took part in 140 battles.

Vaughan Williams, Ralph, O.M., M.A., D. Mus. (1872–1958), English composer. After Charterhouse and Cambridge he studied music in Berlin under Max Bruch and, later in Paris, under Ravel. He wrote nine symphonies besides a number of choral and orchestral works including *Sancta Civitas* and *Benedicite*, *Magnificat*, *Five Tudor Portraits*, *Dona Nobis Pacem*, operas including *Hugh the Drover*, *Riders to the Sea*, ballets, chamber music and songs. He showed great interest in folk tunes. *See* Section E.

Velasquez, Diego (1465–1523), a Spanish soldier and companion of Columbus, sent to conquer Cuba. Velasquez founded Santiago and Havana.

Velazquez, Diego Rodriguez de Silvay (1599–1660), a famous Spanish painter, whose pictures rank among the finest in Spanish art.

Venizelos, Eleutherios (1864–1936), the Greek patriot and statesman, suffered many vicissitudes of fortune during his career. A Cretan by birth, he became Prime Minister of Greece for the first time in 1910, and again on several subsequent occasions, but died in exile. Best known probably for his activity during the Balkan wars, his finally successful attempts to bring his country into the first world war on the side of the Entente Powers, and his ambitions in Asia Minor. At the post-war conferences in 1919 he exercised more influence than anyone else outside the "Big Four."

Verdi, Giuseppe (1813–1901), Italian composer, foremost figure in 19th-century opera. Early works include *Nabucco*, *Ernani*, *I Due Foscari*, and *Macbeth*. A middle period is represented by *Rigoletto*, *Il Trovatore*, *La Traviata*, *Un Ballo in Maschera*, and *Don Carlo*. To the last and greatest period of his life belong *Aïda*, *Otello*, and his last opera *Falstaff*, produced when he was 80. *See* Section E.

Verlaine, Paul (1844–1896), French poet, also well known for his memoirs and confessions; died in great poverty and degradation in Paris.

Vermeer, Jan (1632–75), Dutch painter and the greatest of all the "Little Masters." Jan Vermeer of Delft, as he was frequently referred to, was born in Delft, and obtained considerable recognition in his lifetime, but strangely his existence was entirely overlooked after his death, and until 1860 his paintings were attributed to other Dutch painters. *Lady at the Virginals* is in the National Gallery.

Verne, Jules (1828–1905), was one of the most popular authors of wonder-stories in Europe. The best-known of his numerous works are *Five Weeks in a Balloon*, *Twenty Thousand Leagues Under the Sea*, *Round the World in Eighty Days*.

Vernier, Pierre (1580–1637), inventor of the small sliding scale which enables readings on a graduated scale to be taken to a fraction of a division.

Veronese, Paul, or Paolo Cagliari (1528–88), a celebrated Italian painter of religious subjects. His *Marriage Feast at Cana in Galilee*, *The Feast in the House of Simon*, and *The Presentation of the Family of Darius to Alexander*, are paintings of world-wide celebrity, while his *Adoration of the Magi*, in our National Gallery is a grand work.

Veronica, St., a legendary woman of Jerusalem, who was said to have handed to Christ her kerchief on His way to Calvary. The old belief was that the Redeemer wiped His brow therewith, leaving on the handkerchief a miraculous impression of His face, the so-called "Veronicon." The Saint is commemorated on February 4th.

Verwoerd, Dr. Hendrik Frensch (1901–66), succeeded J. G. Strydom as Prime Minister of South Africa in 1958. Prof. of Psychology at Stellenbosch Univ., 1928–50. Assassinated in Parliament, Cape Town, 6 Sept. 1966. *See also* Section C.

Vespasian (Titus Flavius Vespasinus) (9–79 A.D.) was Roman Emperor during the last nine years of his life. At one time he commanded the Roman army of occupation in Britain.

Vespucci, Amerigo (1451–1512), Florentine merchant and navigator, who settled in Spain as commercial agent of the house of Medici. He made several voyages across the Atlantic and, according to his own accounts, which are disputed by many authorities, reached the American continent on June 16, 1497. A German geographer paid him the tribute of giving the name America to what is now known as South America in a map he published in 1507.

Victor Emmanuel II. (1820–78) was King of Sardinia from 1849 to 1861, became King of Italy, according the the Proclamation of the Sardinian Senate; but it was not until 1870, when the unification of Italy was fully secured, that the title came to have its true significance.

Victoria (1819–1901), Queen of Great Britain and Ireland and Empress of India, was daughter of the Duke of Kent, and came to the throne in 1837 on the death of her uncle, William IV. In 1840 she married Prince Albert of Saxe-Coburg-Gotha, who died in 1861. Lord Melbourne was Prime Minister at the date of the Queen's accession, and for a number of years the country lived through troublesome times, the Corn Law and Chartist agitations being at times very threatening, but a more settled condition of things supervened, and for the remainder of the long and illustrious Victorian reign there was no serious home unrest. The Jubilee of Queen Victoria's accession was celebrated in 1887, and the Diamond Jubilee 10 years later.

Villeneuvre, Pierre Charles Baptiste Silvestre (1763–1806), the French naval commander who was opposed to Nelson at Trafalgar and captured along with his ship, the *Bucentaure*.

Villon, François (1431–c. 1485), French poet who lived at a turbulent time in French history at the close of the Hundred Years War. His extant works consist of *Le Lais* (or *Petit Testament*) and *Grand Testament*, masterpieces of French mediæval verse.

Virgil (Publius Vergilius Maro) (70–19 B.C.), the great Roman epic poet, was born near Mantua, and cultivated a farm in the adjacent village of Andes. He proceeded to Rome in his thirtieth

year to obtain redress for the occupation of his lands by the military. Became known to Octavian and Mæcenas, and, having had his demand satisfied, began the writing of his *Eclogues*. *The Georgics* followed: his most famous work, the *Æneid*, comprised twelve books dealing with the story of the wanderings of Æneas after the destruction of Troy.

Vitus, St., Roman Catholic saint and martyr, who lived in the 4th century. It used to be the custom to dance before his shrine on this festival day, June 15th, in the belief that good health was thereby ensured for the next twelvemonth. The nervous ailment, St. Vitus' dance, derives its name from this practice.

Vivaldi, Antonio (*c.* 1675–1743), Venetian composer. For many years violin master at the Ospedal della Pieta there. His output of orchestral works was prolific, and their reassessment in recent years has immensely added to his reputation, long disparaged by English writers. Bach indeed arranged some of his violin pieces for the harpsichord. *See* Section E.

Volta, Alessandro (1745–1827), Italian physicist, professor at Como and Pavia. Working on the results of Galvani, he found that the essential thing in producing an electric current was contact of dissimilar metals. He invented the voltaic pile, the first instrument for producing an electric current, and thereby laid the foundation of electrochemistry.

Voltaire, François-Marie Arouet de (1694—1778), one of the greatest of French philosophers and writers. His first essays offended the authorities, and he spent the years 1726–9 in England where he wrote some of his dramas. Returning to France he published his *Philosophical Letters*, which aroused the enmity of the priesthood. At this juncture, the Marquise du Châtelet offered him the asylum of her castle of Cirey, and for the next fifteen years he made this his home, writing there his *Discourses on Man*, *Essay on the Morals and Spirit of Nations*, *Age of Louis XIV.*, &c. The Marquise was a mathematician and taught him some science, thus helping him in his interpretation of Newton's *Principia*. To Voltaire we owe the story of the falling apple. He spent the years 1750–3 in Berlin, at the invitation of Frederick the Great.

Vondel, Joost van den (1587–1679), the greatest of the Dutch poets. Most of his dramas are on biblical subjects, and the two most famous are *Jephtha* and *Lucifer*.

Voroshilov, Marshal of the Soviet Union, Klimentiy Efremovich (b. 1881), President of the Supreme Soviet of the U.S.S.R., 1953–60; commander of the Leningrad defences in 1941.

Vyshinsky, Andrei Yanuarievich (1883–1954), Russian jurist and diplomat; conducted the prosecution of the Moscow treason trials, 1936–38; represented Russian interests at U.N.

W

Wade, George (1668–1748), military engineer who after the Jacobite rebellion of 1715 commanded the royal forces in Scotland and constructed the great military roads through the Highlands, some of which have continued to be the main lines of communication. Promoted to Field-Marshal in 1743 and in 1744 George II made him Commander-in-Chief in England. In the last Jacobite rising of 1745 his army was the first to be evaded by the Young Pretender, Charles Edward, on his famous march south.

Wagner, Richard (1813–83), German composer, born at Leipzig. He achieved a new type of musical expression in his operas by the complete union of music and drama, and his influence on later composers was immense. He made use of the *leitmotif* principle and was his own librettist. His originality and modernism aroused a good deal of opposition, and he was exiled for some years. But he was supported by many loyal friends, including Liszt, the young King Ludwig of Bavaria, and the philosopher Nietzsche. He began the music of the *Ring des Nibelungen* in 1853, finishing it a quarter of a century later. It was not until 1876 that the whole of this great drama (Rheingold, Valkyrie, Siegfried, Götterdämmerung) was performed at Bayreuth under the conductor Hans Richter. Other operas include *The Flying Dutchman*, *Rienzi*, *Tannhäuser*, *Lohengrin*, *Tristan und Isolde*, *Die Meistersinger von Nürnberg*, *Parsifal*, a religious drama. He married Liszt's daughter Cosima, formerly wife of his friend Hans von Bülow *See* Section E.

Waley, Arthur, C.H., C.B.E., M.A. (1889–1966), orientalist, well known for his translations of Chinese and Japanese poetry and prose, being the first to bring the literature of those countries to the western world.

Walker, George (1618–90), the hero of the siege of Londonderry, in 1688, who kept the besiegers at bay for 105 days.

Wallace, Alfred Russel, O.M., F.R.S. (1823–1913), British naturalist and joint author with Darwin of the theory of natural selection, b. at Usk, Monmouth. In 1858, while down with illness in the Moluccas, he sent a draft of his theory to Darwin in England who was amazed to find that it closely agreed with his own theory of evolution which he was on the point of publishing. The result was a reading of a joint paper to the Linnean Society.

Wallace, Edgar (1875–1932), English novelist and playwright, famous for his detective thrillers.

Wallace, Sir Richard, Bt. (1818–90), son of the Marquis of Hertford, and inheritor from him of a famous collection of pictures and other works of art to which he himself added largely. This was bequeathed to the nation by his widow along with Hertford House and now forms one of the most important exhibitions in London.

Wallace, Sir William (*circa* 1270–1305), the great Scottish patriot and chieftain who led the Scottish armies against Edward I., and for a time the English were kept completely in check. Later, Edward defeated him at Falkirk, and finally in 1304 he was captured, taken to London, condemned for treason, executed at Smithfield.

Wallenstein, Albrecht von (1583–1634), German soldier and statesman during the Thirty Years' War. An able administrator of his own estates, he sought the unity of Germany, but was distrusted and eventually assassinated.

Waller, Edmund (1606–87), was one of the most graceful of English poets, who tuned his lyre to suit both the Cromwellians when they were a power, and Charles II, when his turn came.

Wallis, Barnes Neville, C.B.E., F.R.S. (b. 1887), British scientist and inventor whose many designs include the R100 airship, the Wellington bomber, the swing-wing aircraft, and the "bouncing bomb" that breached the Ruhr Dams in 1943.

Walpole Horace, 4th Earl of Orford (1717–97), younger son of Sir Robert Walpole. He was a member of Parliament from 1741 to 1768, when he retired to his favourite house at Strawberry Hill (" a little Gothic castle ") and devoted himself to the writing of books and the accumulation of works of art. His letters give a graphic picture of Georgian England.

Walpole, Sir Hugh Seymour, C.B.E., (1884–1941), a well-known British novelist, whose novels include *Mr. Perrin and Mr. Traill* (1911), *The Dark Forest* (1916), and *The Herries Chronicle*, a work in four volumes (1939).

Walpole, Sir Robert, K.G. (**1st Earl of Orford**) (1676–1745), great 18th-century Whig statesman. He sat in the House of Commons for over forty years, and was Prime Minister for the record period of twenty-one years. Although he enriched himself at the public expense, he was a great financial statesman, and his management of the national debt, encouragement of trade and industry, and his mercantilist colonial policy made England materially very prosperous.

Walter, Bruno (1876–1962), a noted conductor of German birth and American citizenship, associated especially with the opera in many different cities.

Walter, John (1776–1847), son of the founder of *The Times* and known as the second John Walter. Was the leading spirit of *The Times* from 1803 to 1847, and it was his efforts that made the journal the greatest newspaper in the world.

Walton, Izaak (1593–1683), one of the most lovable of English writers, the famous author of *The Compleat Angler, or the Contemplative Man's Recreation*. Also published lives of Donne, Hooker and George Herbert.

Walton, Sir William Turner, O.M. (b. 1902) English composer, whose works include concertos for string instruments, two symphonies, two coronation marches, *Façade* (a setting to music of poems by Edith Sitwell), and an oratorio, *Belshazzar's Feast*.

Warbeck, Perkin (1474–99), a Pretender to the English Crown. The son of a Tournai Jew, he claimed to be Richard, Duke of York, supposed to have been murdered in the Tower, and therefore entitled to the throne of England in preference to its then occupant, Henry VII. The Duchess of Burgundy and Charles VIII. of France and James IV. of Scotland gave him their countenance. Warbeck was enabled in 1497 to appear in England at the head of a force of 7,000 men, but was easily defeated, tried for treason and hanged at Tyburn.

Warwick, Richard Neville, Earl of (*circa* 1428–71). "The King Maker," was the leader of the York party in the Wars of the Roses. At the battle of Northampton he made Henry VI. captive, and afterwards proclaimed Edward, Earl of March, king under the title of Edward IV. Then, when Edward showed a disposition to resent Warwick's protection, the latter drove Edward from the country and once more placed Henry VI. on the throne. He lost his life at the battle of Barnet.

Washington, Booker Taliaferro (1856–1915), a famous negro educationist who was Principal of Tuskegee Institute, Alabama, the first and greatest Institute for negro education, from 1881 until his death. He was a tireless worker for a better understanding between negroes and whites. Wrote several books, including his autobiography, *Up from Slavery*.

Washington, George (1732–99), was of English descent, and was living on his American estate at Mount Vernon when the dispute between the British home government and the colonists broke out. He became one of the leaders of the local opposition, and later was elected to the first Congress at Philadelphia. The following year, 1775, saw him Commander-in-Chief of the American army, and from that time to the end of the struggle in 1783 he was trusted and adored by the people, and on the founding of the Republic became its first President in 1789. He served a second term of office from 1793 onwards, and refused election for a third time.

Watson, John Broadus (1878–1958), American psychologist of international fame who formulated the theory known as Behavourism, in which behaviour is described in terms of physiological response to stimuli. It substantiates the work of Pavlov. *See* **J6.**

Watson-Watt, Sir Robert, F.R.S. (b. 1892), British physicist and engineer, chief of team of scientists engaged in radio location research which resulted in every aircraft and ship being equipped with radar aids enabling them to detect, locate, and shadow enemy craft with great accuracy during the Second World War. *See* **Radar, Section L.**

Watt, James, F.R.S., F.R.S.E. (1736–1819). Born at Greenock, this genius was originally a mathematical instrument maker, and being brought into touch with mechanical problems, conceived the idea of the modern, that is, high-pressure steam-engine. Watt took out his first patent in 1769; the engine, however, was used only for mining operations until 1785, when it was applied to a cotton factory. Watt being greatly aided in his developments of the engine by the business ability of his partner, Matthew Boulton.

Watteau, Jean Antoine (1684–1721), a French landscape painter of transcendent ability, and especially great in *genre*. His shepherds and shepherdesses, rustic dance and fête scenes were wonderful for their harmonious brilliancy of coloration. His *chef-d'œuvre* is the *Embarkation for the Isle of Cytherus*, in the Louvre.

Watts, George Frederick, O.M., R.A. (1817–1904), English painter, among whose works may be mentioned *Hope*, which enjoyed great popularity, *Love and Death* and a number of portraits, including Swinburne, Carlyle, Cardinal Manning, Browning, Matthew Arnold, and Tennyson.

Watts, Isaac (1674–1748), a great English hymn-writer; author of *O God, our help in ages past*.

Watts-Dunton, Walter Theordore (1836–1914), a prominent critic and close friend of Swinburne, author of *The Coming of Love* and *Aylwin*.

Waugh, Evelyn Arthur St. John (1903–66), English satirical writer, one of the foremost of his generation; author of *Vile Bodies*, *The Loved One*, *Brideshead Revisited*, *Life of Edmund Champion*, *The Ordeal of Gilbert Pinfold*, and an autobiography, *A Little Learning*. *See* **M12.** His brother, **Alec Waugh** (b. 1898), also a successful writer, is the author of *The Loom of Youth*.

Wavell, Field Marshal Earl, P.C., G.C.B., G.C.S.I., G.C.I.E., C.M.G., M.C. (1883–1950), Viceroy of India 1943–47; Com.-in-Chief India 1941–43; Com.-in-Chief British Forces in Middle East 1939–41; previously Southern Command 1938–39 and of troops in Palestine 1937–39. Described as one of the cleverest generals in the British Army; his strategy against the Italians in the winter campaign of 1940–41 was brilliantly successful.

Webb, Sir Aston, G.C.V.O., C.B., R.A. (1849–1930), President of the Royal Academy, 1919–24, one of our foremost architects, and the designer of the general scheme of the Victoria Memorial in front of Buckingham Palace, the new Birmingham University, the Britannia Naval College at Dartmouth and other fine structures.

Webb, Matthew (1848–83), in 1875 swam the English Channel in twenty-two hours, and was drowned eight years later in an attempt to swim through the Niagara rapids.

Webb, Rt. Hon. Sidney James, O.M. (1859–1947), eminent Socialist, one of the founders of the Fabian Society in 1884. Sec. of State for the Colonies 1929–31, and for the Dominions, 1929–30. Pres. of Board of Trade in first Labour Government, 1924. His wife Beatrice, equally with himself, was a great investigator and writer on political and economic affairs. Among their books were *History of Trade Unionism*, *English Local Government* and *Soviet Communism*. He founded (1913) and edited (till 1922) the *New Statesman*. Raised to the Peerage, 1929, as **Lord Passfield.**

Weber, Carl Maria Friedrich Ernst von (1786–1826), German composer, who is usually looked upon as the founder of the German national opera and of the German romantic movement, which found its complete musical expression in Wagner. His fame rests principally on his three great operas *Der Freischütz*, *Euryanthe*, and *Oberon*, the last being written for Covent Garden. He was an able pianist, conductor, and musical director as well as composer. He died in London after the performance of *Oberon*, and his body was taken back to Dresden in 1844.

Webster, Daniel (1782–1852), an American, who, as statesman, lawyer, and orator, exerted enormous influence on American constitutional ideas and practice. Served twice as Secretary of State and in 1842 negotiated the Ashburton Treaty which settled the Maine–Canada boundary.

Webster, Noah (1758–1843), American lexicographer and grammarian, author of the *Dictionary of the English Language*.

Wedgwood, Josiah, F.R.S. (1730–95), was the most famous of English potters. He was born at Burslem, served an apprenticeship, and in 1759 was able to set up in business for himself. He engaged Flaxman to make classical designs for him, and his pottery became the fashion, and led to a great extension of the Staffordshire earthenware industry.

Weill, Kurt (1900–50), German composer of satirical, surrealist operas, including *Die Dreigroschenoper* (librettist Bert Brecht), and musical comedies, including *Lady in the Dark*, and *One Touch of Venus*. He left Germany in 1933 for France and went to the United States in 1935. *See* **Section E.**

Weingartner, Paul Felix von (1863–1942), Austrian conductor and composer, studied at Leipzig and with Liszt. Established himself as a brilliant conductor, held several appointments in Germany, succeeded Mahler at the Vienna State Opera, and became head of the Conservatory of Music at Basle. His compositions include six symphonies, several operas, and some chamber music.

Weismann, August (1834–1914), a distinguished German biologist who was Prof. of Zoology at

Freiburg, 1886–1912. He is remembered for his theory that heredity is a question of the continuity of the germ-plasm and that acquired characteristics cannot be transmitted to descendants.

Weizmann, Chaim, D.Sc., LL.D., Ph.D. (1874–1952), Zionist leader, became provisional President of Israel in May 1948, and was elected first President in 1949. Distinguished microbiologist and organic chemist.

Wellesley, Richard Colley Wellesley, Marquess, K.G., P.C., K.P. (1760–1842) was Pitt's famous governor general of India, the son of the Earl of Mornington, the first professor of music at Trinity College, Dublin, and elder brother of the Duke of Wellington.

Wellington, Arthur Wellesley, 1st Duke of, K.G., P.C., G.C.B. (1769–1852), was the most famous British general of the 19th century. He distinguished himself in India and conducted successfully the Peninsular War. In 1814 he was British Ambassador at Paris. Then came Napoleon's escape from Elba, the short and sharp campaign which terminated at Waterloo, and the final overthrow of Napoleon. Wellington became the most prominent man in the Empire. From 1828 to 1830 he was Prime Minister. From 1842 to his death he was Commander-in-Chief. His funeral at St. Paul's was one of the great pageants of last century.

Wells, Herbert George (1866–1946), English novelist, sociologist and reformer, one of the most creative and influential writers of his time, a man with a passionate faith in progress through science. His long series of books included romances of the Jules Verne variety (*The Time Machine*, *The Island of Dr. Moreau*, *The Invisible Man*), sociological autobiography (*Love and Mr. Lewisham*, *Kipps*, *Tono-Bungay*, *The History of Mr. Polly*, *Mr. Britling Sees it Through*), and popular education (*Outline of History*, *The Science of Life*, *The Work, Wealth, and Happiness of Mankind*, *The Shape of Things to Come*, *The Fate of Homo Sapiens*). His great attempt at educating the common man proved so successful that his imitators have been legion. He was a founder member of the Fabian Society.

Wesley, Charles (1708–88), brother of John Wesley, and the poet of Methodism. Wrote a large number of hymns of enduring merit.

Wesley, John (1703–91), the founder of the great religious communion of the people called "Methodists," and the son of a clergyman of the Anglican church. Taking orders himself, in 1735, he went to Georgia as a missioner and allied himself with the Moravians, but later he abandoned all ecclesiastical traditions, and established, on a wonderfully well-devised basis, the connexion called by his name. His own open-air preaching was powerful in the extreme, his energy and depth of purpose inspiring, and his organising ability exceptional. He accomplished a great work of religious revivification, taking the world as his parish; and profound as was his conviction of his high calling as an Evangelist, John Wesley "builded better than he knew" in rearing the denominational edifice which is the monument of his faith and vigour. *See also* **Methodism, Section J.**

West, Rebecca, D.B.E. (Mrs. Cicily I. Andrews) (b. 1892) novelist, critic and journalist. Among her books are *Black Lamb and Grey Falcon* (a travel book and commentary on Yugoslavia, 1942), *The Fountain Overflows*, 1957, and *The Birds Fall Down*, 1967.

Westermarck, Edward Alexander, Ph.D. (1862–1939), a distinguished Finnish scientist who was Professor of Sociology at the University of London, 1907–30. Born at Helsingfors, he made an international reputation with the monumental *History of Human Marriage*, written in English and published in 1891. His many other works include *Origin and Development of the Moral Ideas*, 1906–8, *A Short History of Marriage*, 1926, and *The Oedipus Complex*.

Westinghouse, George (1846–1914), American engineer who built the dynamos for Niagara Falls, and in 1865 invented the compressed air brake known by his name and developed a compressed air system of railway signalling.

Westmacott, Sir Richard, R.A. (1775–1856), a great English sculptor who studied under Canova at Rome, and succeeded Flaxman as Professor at the Royal Academy. He executed many fine monuments in Westminster Abbey, at St. Paul's Cathedral, and elsewhere, including the statue of Achilles in Hyde Park and the pediment of the British Museum.

Wharton, Edith (Jones) (1862–1937), American novelist whose *House of Mirth* (1905) brought her fame as a social satirist. Her work was greatly influenced by her friend Henry James, and most of her fifty-four volumes were written after she was thirty-five.

Whately, Archbishop Richard (1787–1863), was for over thirty years Archbishop of Dublin, and achieved a high reputation as a writer on theology and philosophy. His treatises on *Rhetoric* and *Logic* are among the most notable books of their class.

Wheatstone, Sir Charles, F.R.S. (1802–75), was an eminent English electrician and scientist, whose experiments in association with Mr. W. F. Cooke resulted in the first application in this country of the principle of the electric telegraph. The stereoscope was also one of his inventions. He was Professor of Natural Philosophy to King's College, London, for many years.

Wheeler, Sir Charles, K.C.V.O., C.B.E., P.R.A., F.R.B.S. (b. 1892), British sculptor; P.R.A., 1956–66.

Whistler, James Abbott McNeill (1834–1903), was an original artist, writer, and wit, who first came to Europe from America in 1857, and made a name as an etcher both in Paris and in London. His studies of Thames scenery are especially fine. When he began to exhibit pictures in oils he greatly puzzled the critics, some of whom discovered in his "nocturnes" and other studies an impressionist of surpassing genius, while others, including Mr. Ruskin, who described one of the "nocturnes" at the Grosvenor Gallery as a "pot of paint flung in the public face," looked upon them as mere audacious eccentricities. The finest of his oil paintings are the portrait of his mother, and that of Carlyle. He brought an action against Ruskin for the criticism referred to, but only obtained a verdict of one farthing damages without costs.

White, Field-Marshal Sir George Stuart, V.C., G.C.B., O.M., G.C.M.G., G.C.I.E., G.C.V.O. (1835–1912), the heroic defender of Ladysmith in the South African War and a soldier who achieved renown at many points of a long military career.

Whitefield, George (1714–70), was for a time associated with John Wesley at Oxford in the propagation of Methodism and attracted great attention by his gifts as a preacher. He was Wesley's most powerful champion; but in 1741, differing from Wesley on a point of doctrine he left the Methodists, and thenceforward simply preached as an evangelist, allying himself with no sect, but expounding Calvinistic doctrines with fervour and eloquence.

Whitgift, John (1530–1604), a gifted Anglican prelate. Persecuted the Puritans, and was one of the authors of the famous *Lambeth Articles*. Was Archbishop of Canterbury 1583–1604.

Whitman, Walt (1819–92) was an original figure in the world of American authorship, and produced many works of striking poetic merit. He served in the Civil War, and his vigorous humanity, as expressed in his writings, made him a distinguished personality. His works include *Leaves of Grass*, *Drum Taps*, and *Democratic Views*.

Whittier, John Greenleaf (1807–92), America's Quaker poet, was the son of a New England farmer, and for a time followed the trade of a shoemaker. After some experience in journalism, he published his first book of poems, *Legends of New England* (1831). His best-known volumes are: *Lays of My Home* (1843), *Voices of Freedom* (1846), *Songs of Labour* (1850), and *National Lyrics* (1865).

Whittington, Richard (c. 1358–1423), the son of a Gloucestershire knight, Richard became a wealthy London mercer and was three times mayor of London, 1397–98, 1406–7, 1419–20. His wealth enabled him to supply large loans to Henry IV and Henry V. He was well styled "the model merchant of the Middle Ages". His fortune he bequeathed to charitable institutions. The famous legend about him lacks historical evidence, the "cat" story being a

familiar theme in the folklore of almost all the nations of Europe.

Whittle, Air Commodore Sir Frank, K.B.E., C.B. (b. 1907), pioneer in the field of jet propulsion. The first flights of Gloster jet-propelled aeroplanes with Whittle engine took place in May 1941.

Whymper, Edward, F.R.S.E. (1840–1911), a wood-engraver and artist; also one of the best-known Alpine climbers, and the first to reach the summit of the Matterhorn. Author of books on mountaineering in various countries.

Wiggin, Kate Douglas (Mrs. George C. Riggs) (1856–1923), an American novelist of quaint charm and humour. Author of *Rebecca of Sunnybrook Farm*.

Wilberforce, William (1759–1833), was the son of a Hull merchant. He was educated at Cambridge, and entered Parliament in 1780. In 1789 made the first of his many proposals in the House of Commons for the abolition of the slave trade, but it was not until 1807 that the Act embodying these proposals was carried.

Wilcox, Mrs. Ella Wheeler, a popular American poetess (1855–1919). Writer of sentimental verse.

Wilde, Oscar Fingall O'Flahertie Wills (1854–1900), Irish author and dramatist, son of Sir William Wilde, a Dublin surgeon; leader of the cult art for art's sake. His works include poems, fairy-tales, short stories, and brilliantly witty comedies, *Lady Windermere's Fan*, *A Woman of No Importance*, *The Ideal Husband* and *The Importance of Being Earnest*. In 1895 he brought an action for libel against the Marquess of Queensberry, the father of his friend, Lord Alfred Douglas, but he himself was convicted of homosexual practices and sentenced to prison for two years where he wrote his famous poem, *The Ballad of Reading Gaol*.

Wilder, Thornton Niven (b. 1897), American author and playwright. Among his books are *The Bridge of San Luis Rey* and the *Ides of March*.

Wilkes, John (1727–97), a forceful and daring Whig politician who championed the cause of the people with great vigour. For a violent attack on George III's Government in his paper *The North Briton*, he was committed to the Tower, but obtained release on the ground that he was a member of Parliament. He was later expelled from the House and fled to France. He returned in 1768 and was repeatedly elected M.P. for Middlesex and as often denied his seat. A great agitation ensued, and so high was he in favour among the people, that he was made alderman, then sheriff, then Lord Mayor of London. In the end his opponents gave way, the orders against him were withdrawn, and from 1779 he was Chamberlain of the City of London.

Willcocks, Sir William, K.C.M.G. (1852–1932), a British engineer, born in India, who in 1898 planned the great Aswan Dam, which he completed in 1902. In 1911 he undertook for Turkey a vast scheme for irrigating some 31 million acres in Mesopotamia.

Willett, William (1856–1915), an English builder, noted for his long and tireless advocacy of the Daylight Saving scheme, which, however, he did not live to see put into effect. It was adopted as a war-time measure in the year following his death. (*See* Summer Time, Section L).

William I. (1027–87), the "Conqueror," Duke of Normandy, claimed the English throne as legally appointed successor to Edward the Confessor and, at the Battle of Hastings in 1066, defeated Harold II. who was killed. The new king crushed Saxon resistance in the North and West, transferred most of the land to his Norman followers, and drew England into closer relations with the Continent. Maintaining many old institutions such as the shire-court and the fyrd (a non-feudal army), William governed firmly, and was supported by the Church, especially by Lanfranc, Abp. of Canterbury. In 1085 he ordered the Domesday Survey (*q.v.*).

William I. of Prussia (1797–1888), the maker of modern Germany, succeeded to the throne of Prussia in 1861. It fell to him to have the control of his country during a period of mighty transition and development, with Bismarck as his chief minister. The war with Austria rendered him highly popular, and when in 1870 the war with France was entered upon the whole German people rallied round him, and after a series of brilliant achievements by his army he was proclaimed German Emperor on the 18th of January, 1871.

William II. (1056–1100), the Conqueror's son, surnamed "Rufus," King of England from 1087 to his death. Was in constant conflict with his barons, lived a life of wanton pleasure, was oppressive to his subjects, and was shot (by accident or design) while hunting in the New Forest.

William II., the Kaiser (1859–1941), King of Prussia and German Emperor 1888 until he abdicated Nov. 9, 1918, and fled to Holland, where he was subsequently interned in the castle of Doorn, living there in complete retirement until his death in June, 1941. Educated at Cassel and Bonn, afterwards entered the army and took a keen interest in military affairs. Succeeded his father, the Emperor Frederick, in 1888. His reign was marked by a strong militarism and an intense ambition to secure the dominance of Germany in the Councils of Europe—an ambition which contributed to the outbreak of the first great war in 1914.

William III (1650–1702), King of England, Scotland, and Ireland (1689–1702), son of William II of Orange (1626–50) and Mary (1631–60), daughter of Charles I. He married Mary, eldest daughter of the Duke of York (later James II) while Stadtholder of Holland. As captain-general of the Dutch forces he was successful against the French, and in 1688, when James had abdicated and fled the country, William was invited to succeed him and he and Mary afterwards became joint King and Queen. Later he was at war with France, and suffered defeats, but ultimately effected an honourable peace by the Treaty of Ryswick in 1697.

William IV of England (1765–1837) was the third son of George III., and ascended the throne in 1830 in succession to his brother, George IV. He had seen some sea service, and was flatteringly styled the "Sailor King." He was genial and pleasure-loving, but placed no obstacles in the way of government. In the early part of his reign (1832) the first great Reform Bill was passed.

William the Silent (1533–84), Prince of Orange, made many attempts to secure a peaceful settlement of Netherlands' disputes with Philip II, but became the leader of the ensuing Revolt and was assassinated. He established the independence and Protestant character of the Northern Netherlands, where literary, artistic, colonising, and commercial activity flourished in the following century.

Williams, Sir George (1821–1905), the founder of The Young Men's Christian Association.

Williams, (George) Emlyn (b. 1905), Welsh actor-playwright, and producer, who has had great success in numerous plays and films, and latterly in his readings from Dickens and Dylan Thomas. Author of *Night Must Fall*, *The Corn is Green*, and *The Light of Heart*.

Wilson, Rt. Hon. (James) Harold, O.B.E., M.P., M.A. (b. 1916), British statesman and economist; Prime Minister 1964–; elected Leader of the Labour Party after the death of Gaitskell in 1963; Labour M.P. for Ormskirk, 1945–50; for Huyton, 1950–; Pres. of the Board of Trade, 1947–51; Chair. Public Accounts Committee, 1959–63. Chancellor, Univ. of Bradford. *See also* Section C, Part II.

Wilson, Richard, R.A. (1714–82), a landscape and portrait painter.

Wilson, (Thomas) Woodrow (1856–1924), President of the United States 1913–21. Was Governor of New Jersey, 1912–13. In 1916 secured from the Kaiser a promise to abandon the more inhuman forms of submarine warfare, and, on their resumption in 1917, broke off official relations with Germany and proclaimed a state of war. Entered into the conflict with the utmost vigour, bringing the full military and financial resources of the Republic into play against Germany. Was a great factor in the winning of victory and in the concluding of a just peace. Largely responsible for the setting up of the League of Nations, which was foreshadowed in his famous Fourteen Points.

Wingate, Major-Gen. Orde Charles, D.S.O. (1903–44), the leader of the Chindit forces engaged behind the Japanese lines in Burma during the second world war. Killed in an air crash.

Winifred, St., patron saint of virgins, a Welsh maiden, who was beheaded by Prince Caradoc for treating him with scorn.

Wiseman, Nicholas Patrick Stephen, Cardinal (1802–65), the first R.C. Archbishop of Westminster, created Cardinal. Much of his life was spent in the reorganisation and development of the Roman Catholic Church in Great Britain. He was one of the three great R.C. prelates of the nineteenth century, the other two being Manning and Newman.

Wodehouse, Pelham Grenville (b. 1881), English humorist, creator of the inimitable Jeeves in the Bertie Wooster stories.

Wolf, Friedrich August (1759–1824), a great German scholar, regarded by some as the founder of scientific classical philology.

Wolf, Hugo (1860–1903), Austrian song-writer. In his settings of over 300 German lyrics, including many of Mörike and Goethe, he achieved complete union of poetry and music.

Wolfe, General James (1727–59), commanded the British forces in Canada at the siege of Quebec, where he won a brilliant victory, which cost him his own life.

Wolsey, Cardinal Thomas (c. 1473–1530), was the son of an Ipswich butcher. Showing ability, he was sent to Oxford to be educated, later on entering the Church, where he gradually rose to a position of eminence, and was entrusted with several diplomatic missions. He was especially favoured by the King, Henry VIII., and secured rapid preferment under that monarch, being in turn Bishop of Lincoln, and Archbishop of York. He was subsequently made Cardinal and became Henry's Chancellor. For a number of years he was supreme, and by his diplomacy did much to strengthen the kingly power. But when Wolsey was unable, though willing enough, to obtain the papal sanction for Henry's divorce of Catherine, he fell into disfavour, and his decline was rapid indeed. From being a great personage, with a princely entourage, he was humbled, persecuted, and harried, and died at Leicester Abbey a broken, dejected man.

Wood, Sir Henry Joseph, C.H. (1869–1944), was the most popular English musical conductor of his day He introduced many works and composers previously unknown to the British public and greatly stimulated and encouraged interest in classical music. His long association with the Promenade Concerts began in 1895 at the Queen's Hall, and after it was destroyed in an air raid in 1941 the concerts continued at the Albert Hall and are now named after him. He composed songs and cantatas, and his arrangement of sea shanties ends every series of Promenade Concerts.

Woodcock, George, P.C. (b. 1904), succeeded Sir Vincent Tewson as secretary of the T.U.C. in 1960. Won scholarships to Ruskin College, Oxford, and Oxford Univ. and gained first-class honours in philosophy, politics, and economics. Appointed research officer of T.U.C. in 1936 and assistant general secretary in 1947.

Woodville, Elizabeth (1437–91), wife of Sir John Grey. After her first husband's death she made a secret marriage with Edward IV., and became the mother of Edward V., and his brother Prince, both of whom were put to death in the Tower by order of Richard III. She was also mother to Elizabeth, Queen of Henry VII.

Woolf, Mrs. (Adeline) Virginia (1882–1941), English novelist and essayist, daughter of Sir Leslie Stephen and wife of Leonard Woolf, writer and publisher. Together they formed the Hogarth Press. Among her best known works are *To the Lighthouse, Mrs. Dalloway, The Waves, The Years, A Room of One's Own, Orlando.*

Woolley, Richard van der Riet, Sc.D., F.R.S. (b. 1906), succeeded Sir Harold Spencer Jones as Astronomer Royal at the Royal Greenwich Observatory in 1956; formerly Commonwealth Astronomer at the Observatory at Canberra.

Wootton, Barbara Frances, Baroness, M.A., L.H.D., J.P. (b. 1897), Prof. of Social Studies, Univ. of London, 1948–52. Chair. Metropolitan Juvenile Courts. Her book *Social Science and Social Pathology* (1959) examines the state of our knowledge about social pathology, with particular emphasis on criminology and social work. Her *Autobiography* was published in 1967. Created a life peeress in 1958.

Wordsworth, William (1770–1850), the chief of the "Lake Poets," and one of the most inspired of all British bards, was a native of Cockermouth, and was educated at Hawkshead and St. John's College, Cambridge. In association with Coleridge he issued a volume of *Lyrical Ballads* in 1793. The following year saw him settled at Grasmere, and there and at Rydal Mount he passed the rest of his days. In 1802 he married Mary Hutchinson, his cousin, and the two, with the poet's sister Dorothy, formed an ideally poetic household. Here he carried out his creed of "plain living and high thinking," and produced at intervals some of the purest and noblest poetry in the language. As an interpreter of Nature in her many moods he stands unrivalled. Succeeded to the Poet Laureateship on the death of Southey in 1843.

Wren, Sir Christopher, F.R.S. (1632–1723), the most famous English architect of his time. He did not quite have all his own way with the tremendous thirty-five years' task he accepted in undertaking the reconstruction of St. Paul's after the Fire, but he produced a masterpiece of which Britain may well be proud. Chelsea and Greenwich Hospitals, and a number of London's finest churches were also his work.

Wright, Sir Almroth (Edward), K.C.B., C.B., M.D., F.R.S. (1861–1947), discovered the system of anti-typhoid inoculation, the method of therapeutic inoculation for bacterial infections (vaccinotherapy), and methods of measuring the protective substances in human blood.

Wright, Frank Lloyd (1869–1959), American architect who, with others, brought into fashion the present-day horizontal strip and all-glass design. His imaginative ideas, both as to structure and look, have influenced architecture all over the world. Early buildings were the Larkin office building, Buffalo, N.Y., and the Imperial Hotel, Tokio, which withstood the 1923 earthquake. His last building was the Guggenheim Museum in New York, based on a spiral.

Wright, Orville (1871–1948), American airman who, with his brother Wilbur (1867–1912), began gliding experiments on the sand dunes at Kitty Hawk, North Carolina. To the glider they built they added a petrol engine, and on 17th Dec., 1903, they made four flights, the longest being 852 ft. These flights were the first in which a man had been carried from the ground in sustained, controlled flight in a powered heavier-than-air machine.

Wyatt, James, R.A. (1746–1813), a celebrated architect in his day. He built Fonthill Abbey for Beckford and the Royal Military Academy at Woolwich. Pres. of R.A. 1805–6.

Wyatt, Sir Thomas (1503–42), was the first writer of English sonnets, and a poet who did much to develop the earlier forms of verse.

Wyatt, Sir Thomas ("The Younger") (c. 1520–54); joined with the Duke of Suffolk in favour of Lady Jane Grey and against Queen Mary, son of the last-mentioned. Led the men of Kent in rebellion on London in 1554, but was captured and executed.

Wycherley, William (1640–1715), English Restoration dramatist, a master of satiric comedy. His plays include *Love in a Wood*, which won him the favour of the Duchess of Cleveland, mistress of Charles II, *The Plain Dealer*, and his masterpiece *The Country Wife*. His marriage to the Countess of Drogheda lost him court favour.

Wyclif, John (c. 1324–84), born in Yorkshire, educated at Oxford, and one of the most eminent ecclesiastics of his time. He adopted principles many of which became general at the Reformation, and brought down upon himself the bitter enmity of the Roman Catholic leaders, and would probably have been put to death but for the protection of John of Gaunt. While in comparative retirement as Rector of Lutterworth, in Leicestershire, he finished his translation of the Bible.

Wykeham, William of (1324–1404), was Bishop of Winchester from 1366 to his death, and from 1367 to 1371 Lord Chancellor. He was a man of great learning and an excellent preacher, and wielded great influence. He founded New

College, Oxford, in 1879 and Winchester College in 1882.

Wyllie, William Lionel, R.A. (1851–1931), English marine painter whose *The Thames Below London Bridge* was bought by the Chantrey Bequest.

Wyspianski, Stanislav (1869–1907), great Polish poet, dramatist and painter.

X

Xavier, St. Francis (1506–1552), the apostle of the Indies, was the follower of Ignatius de Loyola, and devoted his life to missionary work in the East. He was canonised in 1622

Xenophon (444–359 B.C.), the Athenian general and follower of Socrates. His chief works are *Anabasis Hellenica*, and *Cyropædia*.

Xerxes (*circa* 519–465 B.C.), King of Persia, was the son of the first Darius and a great commander. In 481 B.C. he started on his famous expedition against Greece when, according to Herodotus, he had a combined army and navy of over two and a half million men. He defeated the Spartans at Thermopylae, but his fleet was overcome at Salamis. He reigned from 485 to 465 B.C. and met his death by assassination.

Ximenes de Cismeros, Francisco (1436–1517), Spanish statesman and Cardinal who reformed the Franciscan Order to a great extent, and in 1502 began to direct the preparation of a polyglot bible, the *Complutensian*, which greatly influenced subsequent versions. In 1506 was made Regent for Queen Juana, and raised to the cardinalate in 1507. Personally conducted a military campaign in Africa in 1509, and afterwards became Inquisitor-General, and in 1516, Regent of Castile, but in the following year was dismissed by the Emperor Charles V.

Y

Yeats, William Butler (1865–1939), Irish lyric poet and dramatist and major figure in the Irish literary revival of the 20th century. With Lady Gregory and others founded the Abbey Theatre in Dublin, for which he wrote many plays. Interested in mysticism and the occult. Member of the Irish Senate, 1922–28; awarded Nobel Prize in Literature in 1923. Some of his best work was written in his later years in *The Tower* (1928) and *Last Poems* (1940). Plays include *Cathleen Ni Houlihan* (1902), *The Hour Glass* (1904), *Deidre* (1907).

Yonge, Charlotte Mary (1823–1901), author of over 120 novels, school books, and other works, including *The Heir of Redclyffe*, *The Daisy Chain*, *The Dove in the Eagle's Nest*, and *The History of Christian Names*.

Young, Brigham (1801–77), Mormon leader, and head of the Latter Day Saints of Salt Lake City. At his death he had seventeen wives.

Young, Francis Brett (1884–1954), British novelist. His books include *My Brother Jonathan* and *Doctor Bradley Remembers*.

Young, James, F.R.S. (1811–83), a Glasgow chemist who discovered the method of distilling oil from shale, and founded the mineral oil industry of Scotland, which led to the development of petroleum concerns.

Young, Thomas (1773–1829), one of the most versatile geniuses in history, descended from a Quaker family of Somerset. Studied languages, medicine, and held the Professorship of Physics at the Royal Institution. In 1804 elected Foreign Secretary of the Royal Society. He was very successful in deciphering Egyptian hieroglyphics and was the first to translate the inscription on the Rosetta Stone. Famous for his share in establishing the undulatory theory of light and for his work on physiological optics.

Younghusband, Lt.-Col. Sir Francis Edward, K.C.S.I., K.C.I.E. (1863–1942), soldier, explorer and writer. Wrote many works on the East. Headed the British Mission to Tibet, 1903–04. Was *Times* correspondent with the Chitral expedition. Pres. of Royal Geographical Soc., 1919–22.

Ypres, 1st Earl of, P.C., K.P., G.C.B., O.M., G.C.V.O., K.C.M.G. (1852–1925), entered Navy in 1866, afterwards passing into Army in 1874, making his mark as a Cavalry officer in the Egyptian campaign of 1884; served in South African War with brilliant success. C.-in-C. British Forces in France, 1914–15; C.-in-C. Home Forces, 1915–18; Lord Lieut. of Ireland, 1918–21.

Ysayë, Eugène (1858–1929), Belgian violinist and conductor, noted chiefly for his playing of the works of Bach and César Franck.

Yukawa, Hideki (b. 1907), Japanese physicist, who received the 1949 Nobel Prize for predicting the existence of the meson.

Z

Zadkiel (the angel of Jupiter in Jewish rabbinical lore) was the name assumed by Lilly (1602–81) the astrologer, and also by Richard James Morrison (1794–1874), Hebrew scholar and amateur astronomer, in the almanack known as Zadkiel's Almanack and first issued in 1831.

Zadkine, Ossip (b. 1890), French sculptor, one of the greatest of our time, whose works include *Orpheus*, *The Return of the Prodigal Son*, *The Birth of Forms*, *Poet*, *Harlequin*. Exhibition at Tate Gallery, 1961.

Zaharoff, Sir Basil, G.C.B., G.B.E. (1849–1936), was an influential Greek banker and financier who became an armaments magnate, supplying the Allies in the first world war.

Zamenhof, Ludwig Lazarus (1859–1917), Polish linguist who was by profession an oculist, but gained fame as the inventor of Esperanto.

Zeno of Citium (*c.* 340–264 B.C.) was a Greek philosopher who founded the Stoic system.

Zeppelin, Ferdinand, Count von (1838–1917), inventor of the huge dirigible airship bearing his name. His first ascent was in 1900. He organised a Zeppelin service for the German army in the war of 1914–18, but their extreme vulnerability militated severely against their usefulness.

Zeromski, Stefan (1864–1925), great Polish novelist, poet and playwright.

Zhukov, Marshal of the Soviet Union Grigory Konstantinovich (b. 1895), led the defence of Moscow and Leningrad during second world war; served on Allied Control Commission in Germany; C.-in-C. Land Forces and Deputy Minister of Armed Forces of Soviet Union, 1946–55; succeeded Marshal Bulganin as Defence Minister, 1955–57.

Zhukovsky, Vasily Andreyevich (1783–1852), Russian poet whose original work had very important influence on Russian literature.

Zola, Emile Edouard Charles Antoine (1840–1902), was the son of an Italian engineer, and came before the public as a novelist in 1867 with *Thérèse Raquin*. He then conceived the idea of a series of novels which should depict the history of a Second Empire family in various realistic phases, and began the series with *La Fortune des Rougons*, in 1871. In 1877 he made a higher success by *L'Assommoir*. From that time every novel he published had an immense sale.

Zorn, Anders Leonhard (1860–1920), was a noted Swedish painter, etcher and sculptor.

Zoroaster, the Greek form of the name of the Persian prophet, Zarathustra, who lived about the seventh century B.C. He was a monotheist, believing in a good and holy God whom he called Ahura Mazda. Many of his teachings were absorbed by the ancient Persian religion which survives today among the Parsees in India.

Zoshchenko, Mikhail (1895–1958), Russian writer whose humorous short stories, satirising the Soviet way of life, were wildly popular throughout Russia in the 1920s. Several have been translated and published in England.

Zosimus (fl. *c.* A.D. 300), the first known alchemist. He lived in Alexandria.

Zuccarelli, Francesco (1702–88), a very celebrated Italian artist, who came to England, succeeded, made a handsome fortune, and was one of the first membersof the Royal Academy.

Zuckerman, Sir Solly, C.B., M.A., M.D., D.Sc., F.R.S. (b. 1904), British biologist; Prof. of Anatomy, Birmingham Univ., 1939–; chief scientific adviser to the Government and head of the Government's scientific service.

Zwingli, Ulrich (1484–1531), was one of the ablest of the Swiss Reformation leaders.

Zwirner, Ernst Friedrich (1802–61), an eminent Silesian architect. Restored Cologne Cathedral.

BACKGROUND TO PUBLIC AFFAIRS

TABLE OF CONTENTS

BACKGROUND TO PUBLIC AFFAIRS

This section is in two parts. The first describes some major events since the war and carries the story to 1968. The second part describes our own political institutions, the Commonwealth, the United Nations and Western International Organisations.

I. STORY OF POST-WAR EVENTS

1. BRITAIN: POLITICAL BACKGROUND.

The End of Another War.—The way the British people greeted the end of the Second World War was markedly different from their feelings in 1918. The First World War had ended almost as suddenly as it had begun: and there was then an explosion of relief and rejoicing of a kind which has not been seen since. After all, that was a "war to end war." It could never happen again. England was to be a land "fit for heroes to live in." The outbreak of the war in 1914 had been a sudden shock to a world confident of peaceful evolution. The British people, having seen it through, were again confident that nothing like it could recur. The instant reaction when the end came was therefore one of delirious relief. The mood at the end of the last war, however, was very different. That war came gradually but relentlessly all through the 'thirties and it ended gradually too. We were in a sense at war long before it formally started; and at the end there was no clear emergence into a cloudless era of assured peace and progress. To maintain peace a continuous effort was seen to be necessary. Ideas had played a much greater part in sustaining men and women in the second great war than in the first: their sense of responsibility had grown so that the mood when the end came on 8 May 1945 was more questioning and cautious than in November 1918. Further, the second great war had touched everyone more directly—the bombing of cities, the imminence of invasion, the food shortages, the evacuation of school children, all this had spread the impact; and, when it was over, the mood was one of sober resolve.

The Age of Bewilderment.—Before we continue our narrative let us take a backward glance at the years between the wars, not to describe the events, which included the emergence of authoritarian tyrannies and a world-wide economic crisis, but to mark some of the moral characteristics. It was said to be a period of disillusionment, of moral and intellectual decay. There was the loss of faith in democracy; a sense of aimlessness reflected in the arts, a good deal of confusion and uncertainty about values, and, above all, insecurity. That there was this political apathy and bewilderment is true: but much to the contrary is true also. This was, after all, the nation which had won the war and, by resolution and will, was to win the next. The nation faces difficulties again. We shall see later that these difficulties seem hard to diagnose but we shall try to disentangle in this story the elements in what has been called our social malaise.

The First Atomic Explosion.—Momentous events were to come. The war with Japan was not yet over. Although the secret was kept at the time, the first full-scale atomic bomb explosion was made in the Mexican desert in July 1945 through the concerted efforts of a team of scientists working in America. The bomb was detonated at the top of a pylon 100 feet high and a space of ten miles cleared. Devastation inside a one-mile circle was absolute. It offered a means to a speedy end of the war with Japan. It has proved to be the first of a series of tests of increasingly powerful bombs which pose the greatest threat which has ever faced mankind and may yet destroy civilisation. A few days later the United States and Great Britain called for unconditional surrender by Japan and upon its rejection a bomb was dropped on August 6 on Hiroshima and a second on Nagasaki on August 9. The surrender terms were then accepted. Churchill in his account of the war describes his own view that there should have been no rigid insistence on "unconditional surrender." "It would be a mistake", he writes, "to suppose that the fate of Japan was settled by the atomic bomb. Her defeat was certain before the first bomb fell."

The Face of the Post-war World.—Far-reaching changes mark the decade which ended with the Suez affair of 1956. Asian countries, driving towards independence, reached their objectives, and a similar drive in African countries was gathering momentum. The war had impoverished Britain and France, which could no longer be powers great enough to follow an independent course; and they both played rôles, although different ones, in launching Western Europe towards unity. The victors of the war quarrelled and this vitiated the working of the United Nations, which had been founded on the hope that the victors would not quarrel—not, at any rate, so profoundly that we should no longer have a state of peace but a condition given the frank but dispiriting title of "the cold war." The direct confrontation of the two great Power blocs—the United States and the Soviet Union—was therefore a cardinal feature of the decade, with the development of atomic weapons. The competition in armaments was matched by another competition in economic power. Both sides made a bid for the support of the new Afro-Asian countries; and it was seen that what attracted those countries was naturally the technical means to satisfy hunger and to secure clothing, shelter, and the materials with which to live. Russia, therefore, turned increasingly to the training of scientists and technologists in the drive towards industrialisation and economic growth, likely to comfort the peasantries of the new continents.

Estrangement between West and East.—The war had engendered friendship between Western Powers and Russia. Why did they so quickly fall apart with the defeat of the enemy—a fact which was to transform the history of the world? The fact was that relations were reverting to their pre-war state of hostility. Nazi Germany had divided the West from Russia: Russia had been suspicious of our appeasement of Germany which might liberate her for attack eastwards. And when, eventually, Russia and Germany signed a non-aggression pact in 1939, which freed Germany to turn west instead of east and to attack us, our hostility towards Russia naturally deepened. Popular feeling changed when Hitler invaded Russia in 1941 but co-operation between Western and Soviet leaders was not so close as to prevent ill-feeling—one cause of mistrust being the Russian belief that our invasion of Europe was being unjustifiably delayed. When the war ended there was still an abundance of goodwill towards Russia. But a number of political facts worked the other way. The Russians had taken a hold over a number of countries in the eastern half of Europe; and this led to the establishment in those countries of communist régimes. Were the ideas of

Russia necessarily antagonistic to the West? They were certainly incompatible. In Stalin's view, especially after his experience of Germany's invasion, there could not but be hostility from the West. This sense of suspicious defensiveness made Soviet foreign policy complex and enigmatic. Whatever the reason might be, Russia's policy followed a course which could not be easily understood; and the goodwill towards her was allowed to evaporate.

The Bomb.—In the first years of the decade the Red Army was supreme on the ground in Europe and Asia and the U.S. Air Force supreme in the air. It was the Red Army versus the atomic bomb. But in September 1949 the Soviets exploded an atomic bomb and the four years of American monopoly was over. The race for bigger bombs intensified. The United States exploded a hydrogen bomb in November 1952 and Russia followed in August 1953. The new weapon was different not only in degree but in kind. The killing effects were incalculable; and the after-effects on future generations unpredictable. Eisenhower said there was no alternative to peace; but no solution was reached on practical issues—on the two Germanys, on the status of the satellite countries in Eastern Europe, on the future of the Middle East. The post-war world disintegrated. Neutralism was seen as the only hope of survival by those countries where pent-up forces of nationalism were being released.

The Technological Race.—The race between Russia and the West was not a new one; Professor Toynbee has pointed out that it began in 1700 when Peter the Great created a strong country against invaders who had deprived her earlier of so much. Russia, defeated in the first great war, made a new start in 1917 when she threw communism (a creed borrowed from the West) into the scale. She drew ahead and after a long and bitter struggle beat the Germans in 1945 as Peter the Great had driven Russia ahead, eventually beating the French in 1812. With the American success with the atomic bomb Russia fell behind again; but she resumed the race with the West and was first with an earth satellite (1957) and a manned satellite (1961). In their technological breakthrough in 1957 the Russians developed the first inter-continental ballistic missile. The see-saw continued and, in 1961, the Americans perfected the cheap, quickfiring ICBM, the Minuteman.

The Creation of the "Satellite" States.—The satellite states, as they are known, were set up by Russia in the countries of Eastern Europe which had been occupied by Russia in the final stages of the war. This occupation had been made militarily easier when the Americans, in August 1944, had withdrawn 100,000 men from the Italian campaign for a seemingly needless invasion of the south of France. The states were Czechoslovakia, Poland, Roumania, Albania, Hungary, Bulgaria, and Yugoslavia—all, except Hungary, inhabited by peoples mainly of Slav race. Yugoslavia, however, eventually broke away under its national leader, Marshal Tito, though the country remained communist. At the Yalta conference of February 1945 attended by Roosevelt, Churchill, and Stalin, Russia had agreed that democratic governments should be set up in Eastern Europe. But the transformation of the countries to Communist régimes began very shortly afterwards and by 1948 was complete.

The Cold War and the West.—The failure of the nations to make treaties of peace or arrangements for general disarmament, and the continuing loss of confidence between Russia and the West led to an increase of armaments and defensive pacts by both sides. In the West rearmament was carried out by the U.S.A. and Western Europe on the lines of an agreement made in 1949 and known as the North Atlantic Pact. They formed the North Atlantic Treaty Organisation (NATO), the first supreme commander being Eisenhower who afterwards became, for two terms, President of the United States (being succeeded by Kennedy in 1961). The Russians, on their side, organised the Communist countries by a "Warsaw Pact." It is refreshing to note that Austria, by agreement in 1956, established a democratic republic, to be permanently neutral like Switzerland. In Asia a number of countries which met at Bandung in Indonesia in 1955 with some African countries decided to keep neutral. Four Asian countries, however (Turkey, Iraq, Iran and Pakistan), neighbours of Russia, formed a defensive pact with Britain—the Baghdad Pact (later to become the Central Treaty Organisation or CENTO). Some countries bordering the East and South Pacific, including Australia and New Zealand, formed the South East Asia Treaty Organisation or SEATO for mutual defence against the Communists.

The General Election of 1945.—This election was quiet, conducted on an out-of-date register but with a postal vote for the Forces. A lively issue had been introduced by Churchill, who declared that if the Labour Party won the election Attlee, as Prime Minister, would be under the control of Harold Laski who was then chairman of the national executive of the Labour Party. This declaration stemmed from a statement which had been made by Laski that the Labour Party would not be bound by any commitments entered into by Attlee when, as leader of the Labour Party, he accompanied Churchill to the Potsdam conference with Stalin and Truman in June. A correspondence of increasing bitterness followed between Churchill and Attlee who asserted "The Chairman has not the power to give me instructions." Attlee seemed on surer ground in the interpretation of the constitution of his own party. The popular impression was that the matter was an election scare devised by Churchill's campaign advisers. The Labour Party had a dramatic victory, 393 Labour M.P.s being returned, with a clear majority over all other parties. They did not have a clear majority among the voters, the Liberals holding a balance. But the bias present in the constituency system worked in favour of the Labour Party.

The Resignation of Churchill.—Ordinarily Churchill might have been expected to take a few days to wind up the affairs of the Government. This would have enabled him to present the unconditional surrender of Japan to the nation. But two factors led him to resign at once and advise the King to send for Mr. Attlee. These factors were the need for Britain to be represented with proper authority at the Potsdam conference where great issues were coming to a head; and the overwhelming nature of the verdict of the electors. He thanked the nation that day for the "unflinching, unswerving support" which they had given him in his task in the war and "for the many expressions of kindness which they have shown towards their servant."

Churchill's Premonition.—There is a moving story in the last volume of Churchill's work *The Second World War* of his sudden premonition of electoral defeat. On 25 July 1945 he flew home from Potsdam and went to bed, accepting the view of the Conservative Party managers that the British people would wish him to continue his work and that it would be possible to reconstitute the National Coalition Government in the proportions of the new House of Commons. On that belief he slumbered. "However, just before dawn," he writes, "I woke suddenly with a sharp stab of almost physical pain. A hitherto subconscious conviction that we were beaten broke forth and dominated my mind. . . . The power to shape the future would be denied me. . . . I was discontented at the prospect, and turned over at once to sleep again." When he awoke the first results had begun to come in and they were, as he now expected, unfavourable. By noon it was clear that the Socialists would have a majority. His wife said to him, "It may well be a blessing in disguise," to which he replied, "At the moment it seems quite effectively disguised."

The Causes of the Conservative Defeat, 1945.—Looking back over twenty years later it must seem puzzling that the country could have been so ungrateful to the man who had pulled the nation through tragedy to triumph. But the people were not ungrateful. Their verdict was registered, rightly or wrongly, against the Party which had excluded Churchill from office during the pre-war years. The verdict was directed against the Conservatives despite the admiration for Churchill. It was they, not he, who were condemned for the Munich Agreement and for the pre-war unemployment. There was also an undercurrent of concern that events might follow the pattern of the First World War when the war leader, Lloyd George, was re-elected on generous promises which were not fulfilled.

Labour Faces a Financial Crisis.—On coming to office in 1945 the Labour Government was faced with the end of the financial assistance given to Britain during the war by the United States under the system known as Lend-Lease (*see* L). The Government accepted a dollar loan but the money ran out by 1947. Stafford Cripps was appointed Minister of Economic Affairs to deal with the crisis and, in the autumn, when Dr. Hugh Dalton resigned as Chancellor of the Exchequer after an indiscreet Budget disclosure to a journalist, he combined both posts. Cripps had been a brilliant lawyer before entering politics. He was now master of the economic affairs of the nation. He introduced a programme of austerity in order to reduce the demand for foreign currency; and the trade unions co-operated by accepting a policy of "wage restraint." This co-operation was willingly accorded because Cripps controlled prices, maintained an equitable taxation system and because of the social services which the Government had introduced.

The Marshall Plan.—Assistance to Britain came in a new way. In 1947 George Marshall, U.S. Secretary of State, proposed a scheme whereby his country would assist in a programme for putting Europe on a sounder economic basis. The programme would need to be a joint one, agreed to by a number, if not all European nations; and the initiative must come from Europe, the United States giving friendly aid and support. Ernest Bevin, Foreign Secretary, jumped at the offer and with fifteen other nations drew up what became known as the European Recovery Programme. The Organisation for European Economic Co-operation which, of course, is still in being, came into existence to administer the programme.

Bevin and America.—Bevin worked increasingly for effective collaboration with America and he was a prime mover in creating the North Atlantic Treaty Organisation (1949). This was the first treaty in which the U.S.A. had ever undertaken European commitments in peace time. It grew out of fear of Russian power. Bevin's policy was criticised by some members in his own party. Criticisms varied. One was that Bevin had abandoned a specifically socialist foreign policy and that he should have attempted to retain independence between the two worlds—the capitalist and communist worlds—and tried to build a bridge between them. This view was crystallised in the advocacy of a "third force" of powers standing between America and Russia and led by Britain. The group expressing this view were known as the "Keep Left" group, and it was about this group that Bevin made the often quoted remark that he had been "stabbed in the back." The members of this group of "Labour Independents" were defeated in the 1950 election.

The Work of the Labour Government, 1945–50.—The first measure was the nationalisation of the Bank of England which Churchill said did not raise any question of principle and there was little opposition. The National Coal Board, established as a public but semi-independent body, took over a very inefficient industry. The British Transport Commission was created in 1947 and took over railways, canals, and road haulage. Cable and wireless companies were nationalised and public corporations created to run airlines; in these measures the new Government were following the lines of policy accepted by earlier governments. The creation of the British Electricity Authority (1948) and the Gas Council (1949) enabled management to be taken of industries which were already under some public control. Beyond all this the Government built a "welfare state" in which the social services were no longer regarded as a form of poor relief but as a co-operative system of mutual aid and self-help provided by the whole nation and designed to ward off distress and strain wherever they may fall. At the centre of the system were the social insurance scheme and the national health service.

The Controversy over Iron and Steel.—The question of the nationalisation of this industry proved controversial and difficult. It was left to the last by the Government. The industry, which was profitable and fairly efficient, was also very complex, ownership penetrating into industries other than engineering. The nationalisation of iron and steel took effect in February 1951 (by the administration formed after the general election of 1950 when the overall Commons majority of the Labour Party was reduced to only six); but the Conservatives, returned to power in 1951, denationalised the industry. It was renationalised in 1967. *See* G16(1).

The National Health Service.—This welfare service was created by the Labour Government's National Health Service Act of 1946 and became operative in 1948. It provided all those who take advantage of it with free medical and hospital treatment. The cost is met partly by contributions from general taxation and partly by compulsory contributions from all citizens (except certain exempted persons) and these contributions are payable whether or not advantage is taken of the service. Aneurin Bevan who as Minister of Health had piloted this great scheme through all its stages, resigned when the Labour Government imposed charges on spectacles and teeth in 1951 although this was intended only as a temporary measure. Since then, however, governments have continued to increase general charges —on contributions, on spectacles, dentures, welfare foods, and amenity beds. The charge on prescriptions has been removed and reimposed. *See also* G26(1).

The Continuing Needs of a Welfare Society.—Writing nearly two decades later we can see that social services can never be finished articles. A school of writers led by Professor Richard Titmuss have recently shown that some groups have benefited far less than others from the recent increase in production and that behind the façade of affluence there are "submerged groups." Serious social problems remain like the adequate care of the aged, housing and unemployment caused by economic and technical changes. The subject of the care of the aged becomes more urgent every year since the number of people above working age in the United Kingdom is steadily increasing.

Labour and Asia.—The granting of independence by the Attlee Government to India, Pakistan, Ceylon and Burma was of the greatest importance. Seen at the time as a historic achievement, the passage of time has confirmed its momentous nature. It is difficult to contemplate into what tragic paths we might have fallen had independence for India been further delayed. Independence to countries is very rarely given too soon. How easy it is to see now that Britain would have benefited enormously—and the wider world too—had a settlement between her and Ireland not been tragically delayed. The clock of progress was put back fatally. We were spared further conflict with our Asian dependencies by the decisive action of Attlee in sending Lord Mountbatten to India as the last Viceroy in order to transfer power to the Indians. Of the four new states in Asia only Burma elected to sever its links with the Commonwealth.

The Changing Commonwealth.—At this point we may glance ahead at the further evolution of the Commonwealth which followed the grant of independence to the Asian countries—a step criticised vehemently at the time but now seen to have been wise. As other countries in the Commonwealth reached sovereign status most of them sought full membership, so that there were welcomed to membership Ghana and Malaya in 1957, the Federation of Nigeria in 1960, Cyprus, Sierra Leone and Tanganyika in 1961, Jamaica, Trinidad and Tobago, and Uganda in 1962, Kenya and Zanzibar in 1963, Malta, Malawi, and Zambia in 1964, Gambia and Singapore in 1965, Botswana, Guyana, Barbados and Lesotho in 1966, Mauritius and Swaziland in 1968. Thus we have a system which bears no resemblance to the empires of the past, a partnership based upon friendship between nations with a diversity of race, religion, and language. This evolution we are now beginning to take for granted; but it must not be forgotten for it is one of the most heartening features of our time. *See also* Part II.

Labour Faces the Country, 1950.—During the whole of its term of office, 1945–50, the Labour Government had not lost a single by-election. But the general election of 1950 gave the Labour Party only a very slight majority. They secured only 315 seats, against 298 Conservatives, 9 Liberals, and 2 Irish Nationalists. A considerable defection of middle-class voters resulted in suburban seats in London and the Home Counties returning to Conservative allegiance. Dissatisfaction with continued shortages and with rationing no doubt played a part. The redistribution of seats due to population movement had resulted, in 1950, in an electoral system with a slight bias against the Labour Party since support in working-class areas was so strong as to bank up enormous Labour majorities there, whereas the Conservative vote was more diffused and thus more effective in electoral figures. The result ended Labour's effective control of Commons. Government was scarcely possible with a majority of six and the parties renewed their fight at another election which Attlee called in October 1951.

The Conservatives Regain Power, 1951.—The Labour Party secured the highest total poll that it or any other party had received in a general election—fourteen million votes. The Conservatives received a quarter of a million less; but they secured a majority of seats. This anomaly was due to the character of the electoral system described above. The composition of the new House was 321 Conservatives, 295 Labour, 6 Liberals and 3 Irish Independents. In the atmosphere of relaxed responsibility the controversy which had begun within the Labour Party while they were in power was renewed.

Churchill at Eighty.—No Prime Minister had been so honoured as when members of both Houses assembled in 1954 in Westminster Hall to present to him a book signed by them and a portrait of him by Graham Sutherland. A memorable description of the scene is reprinted from *The Guardian* in "The Glory of Parliament" by Harry Boardman—the throng of several thousand, the drums of the Guards' band beating the opening bar of the Fifth Symphony, which Churchill had so memorably converted into a victory sign ten years earlier. He disclaimed having inspired the nation in the war. He had had only to appeal, he said, to the remorseless, unconquerable will of the people. "It was the British race that had the lion's heart. I had the luck to give the roar."

Eden Succeeds Churchill.—The new Prime Minister, Anthony Eden, who succeeded Churchill in April 1955 decided upon a general election, thus taking advantage of two factors, the controversy within the Labour Party and the economic recovery at that time. There were also, at the time, a number of strikes or threats of strikes which affected a wide public and these disputes were unfortunately due in part to inter-union rivalries. The Conservatives increased their majority from 17 in 1951 to 58.

The Election of 1955.—The Conservatives had a total of 345 M.P.s, Labour 277, Liberal 6 and Sinn Fein 2. Both the Conservative and Labour votes fell—the first by some 400,000 and the latter by over 1·5 million. When Parliament assembled four older members, including Dalton, resigned because of their age from the Labour Shadow Cabinet; and when at the end of the year Attlee resigned the leadership, Hugh Gaitskell was elected leader of the party by a substantial majority. The Labour Party was more solidified as a result of the Government's Suez adventure and Bevan was brought back as "Shadow Foreign Secretary."

Attlee's Achievement.—Attlee, who thus retired from the leadership of the Labour Party, went to the House of Lords as Earl Attlee. If Churchill stood for the "finest hour" in our history, Attlee stood for the social revolution which followed it. He was the most modest man ever to engage in politics. As a young man he had gone to the East End of London to take up social work and had become Mayor of Stepney. Nobody then could possibly have imagined that he would one day become Prime Minister and Churchill's Deputy Prime Minister for five years of war. "The difference between the two," wrote Harry Boardman (who described the Parliamentary scene so brilliantly for many years for *The Guardian*), "is between genius and extraordinary ordinariness." "True there is no colour, no magnetism, but there is great concentration of purpose, a mind with a razor edge and something of harsh resolution." This simple man of few words transformed the social and economic fabric of the country and changed the face of the Commonwealth into the beneficent world-wide system it has become. He was widely mourned when he died in 1967.

Conservatives' Third Consecutive Victory, 1959.—During the 'fifties the Labour Party had to endure the loss of three consecutive elections and a loss of increasing margins. In 1959 after eight years in office the Conservative Party secured the return of 365 Conservative members, with 258 Labour and 6 Liberal members and one Independent. It was at this election that the Liberals doubled their share of the vote partly by running more candidates and partly by the increase of votes in many of the contests in which they took a part.

Hugh Gaitskell.—In the three years preceding the death of Hugh Gaitskell Labour had lost its best orator in Aneurin Bevan and its best organiser in Morgan Phillips. It was to lose Hugh Gaitskell when, after ten years, it seemed he had won public confidence as the head of a possible alternative government. Educated at Winchester College and New College, Oxford he achieved the highest academic distinction as an economist. It was under the inspiration of Professor G. D. H. Cole at Oxford that he chose to work for the underdog; and on graduation when he became a university lecturer in economics he gave all his spare time in the service of the Workers' Educational Association, teaching economics to Nottingham miners. During the war, serving in the Civil Service, he came under the notice of Hugh Dalton. At the end of the war he chose politics as a career and won the confidence of Stafford Cripps. Upon Cripps' death, Gaitskell succeeded him as Chancellor of the Exchequer, making the spectacular rise from member to Chancellor in six years. This rapid rise was due to his intellectual powers, his gift of exposition, his industry and his character; the whole of these qualities being informed by his humanity and hatred of injustice. Disappointed by Labour's third defeat in 1959 he initiated discussion as to how the Labour Party could be modernised. In the words of a colleague, he was able to show that the Party's "socialist idealism, which is essential to it, is not static, not something writ on tablets but a constantly developing attitude of heart and mind capable of embracing and

giving a new meaning to twentieth century society." At Brighton in 1962 he clearly had a united Conference behind him when he delivered a searching speech on the Common Market, setting out the criteria which needed to be satisfied before entry could be regarded as a benefit to country and Commonwealth. When struck by illness at the end of that year, Gaitskell had been acclaimed as a potential prime minister; but the greatest opportunities were lost to him. He was succeeded as leader of the Party by Harold Wilson who became Prime Minister in 1964 and for the second time in 1966.

The Macmillan Years.—Harold Macmillan succeeded Eden in January 1957 at the age of 62, in the aftermath of Suez, and he devoted himself to re-establishing the friendly relations with the United States which had been strained by the Suez affair. Early in 1959 he went to Russia for preliminary soundings for a Summit Conference, which, through no fault of his, was to collapse immediately it opened in Paris in May of the following year. In February 1960 he had shown great courage in a speech before both Houses of the Union Parliament in South Africa when he referred to "the wind of change" in the relations between Black and White in the continent of Africa. It was in July 1961 that Macmillan announced that Britain would apply for full membership of the Common Market, negotiations continuing till their breakdown in January 1963. Among other important events of his premiership were: the explosion of the first British hydrogen bomb; the settlement of the Cyprus dispute; the winning of the General Election of October 1959 with an increased majority of 100 seats; the cancellation of the *Blue Streak* missile programme, and the agreement for U.S. *Polaris* submarines to use Holy Loch; the failure in 1958 to secure free trade with the Common Market and the consequent setting up in 1960 of a European Free Trade Area with countries outside the Market; the setting up of the National Economic Development Council; the legalisation of betting shops; the winding up of the Central African Federation; the nuclear test ban treaty; and the establishment of a Federation of Malaysia.

The Resignation of Macmillan.—From the middle of 1962 the Government seemed dogged by misfortune which, it was doubtless hoped, would be changed by Britain's entry into the Common Market. Quickly following Britain's exclusion came the hardships of a severe winter and of a sudden increase in unemployment. When the spring came the Government were caught in another misfortune, the Profumo affair, involving the resignation of its War Minister. This did nothing to still the feeling in the Conservative Party that the Prime Minister should make way for a younger man, although there was a natural reluctance to press the Profumo affair as a suitable occasion for his departure. Mr. Macmillan indicated that he hoped to lead the Party at the next election. This discordant position was suddenly cut by Mr. Macmillan's illness, which compelled him to resign. By a coincidence his announcement came (10 October 1963) the day after the annual Party Conference had opened. The resignation would in any event have caused a great debate in the Party; but dropped suddenly into the excited atmosphere of a conference it caused a tumult. Many analyses have been made of the history of those days.

Lord Home Becomes Prime Minister.—Mr. Macmillan's sick-bed became the centre of the vortex in the following week. The Cabinet approved a memorandum by him as to how soundings should be taken in the Cabinet, the two Houses and the Party Organisations. Soundings were taken and two days later they were said to show a continuing deadlock between Hailsham and Butler but a small lead for a third; and this third man was not Maudling but Lord Home, then Foreign Secretary, who had been widely regarded as a non-starter. Mr. Macmillan recommended Home to the Queen. How confused the situation was is illustrated by the fact that on the very morning when the Queen sent for Lord Home the first headline in *The Times* was "The Queen may send for Mr. Butler today."

There was an acute debate within the Party as to the way in which the leadership had been decided; and this debate resulted in a method (described below) of electing the leader of the party.

Election Year 1964.—Parliament's legal term expired in the autumn of 1964 but there remained the question whether Sir Alec Douglas-Home would go to the country in the spring or in the autumn. Concealing his hand till the last moment Sir Alec decided to wait till the autumn. For many months, therefore, the country discussed the issues involved and thus went through much of the emotions of an election, which, when it came, seemed belated, the people being a little weary of worked up turmoil by politicians, press, and pollsters. Some of the fire of an election had thus been drawn prematurely from it, but no General Election can lack drama. The Government's majority dissolved and Mr. Wilson kept the lead to a photo-finish. The resultant position is examined in Part II with an outline of some of the far-reaching consequences. Before, however, leaving this point in our story we must note the coincidence by which, within the very two days on which the results came in, there occurred two events of world-wide importance—the fall of Khrushchev and the explosion by China of an atomic bomb. If the latter was expected, the former was certainly not. These events, which are discussed later, were more than could be assimilated and their significance will take a long time to digest.

Problems Facing the New Government at Home.—Let us take a glance at the sea of troubles which immediately advanced upon the Wilson administration. The general nature of these troubles had, of course, been foreseen; but they were none the less formidable for that and their exact nature when revealed (like the Treasury's forecast of the payments deficiency) showed they were even more severe than supposed. Production needed to be raised and steadily expanded. For this a number of fundamental steps were necessary. To expand without inflation, an incomes policy (coupling incomes and wages with production) needed to be introduced; and this called for fresh attitudes by both sides of industry. Industry needed to be reinvigorated by science and technology and fresh educational foundations required to be laid. Planning, detailed in character and comprehensive in scope, required both regional, as well as national, planning. "They've given me a bed of nails," said the new Minister of Labour. The metaphor could have been aptly used by the whole of the new team.

Problems Abroad.—The problem of our security posed the question of what kind of co-operation with our allies was desirable and what, then, was possible, an enigmatic France being antagonistic to a Western alliance. How could the long deadlock on disarmament be broken? What rescue could be raced to an overstrained and threatened United Nations? The most ominous troubles seethed in Africa, in the Congo, in Rhodesia, in South Africa. In Asia, the sub-continent of India was developing all too slowly. China, estranged (through no fault of Britain) remained unpredictable as estranged people are apt to be. There was an ugly confrontation between Malaysia and Indonesia. And beyond all these questions and many more remained perhaps the gravest of the lot—half the world underfed, ill-housed, underdeveloped, with insufficient hope. One of the mysteries which will baffle future historians is why so little popular concern was expended on a plight fraught with so much danger for all of us.

The Passing of Winston Churchill.—When Churchill died, not long after his ninetieth birthday, on 24 January 1965 his countrymen and the whole world paid their tributes to the greatest Englishman of his time and recalled the facts of a truly astonishing career. In his *Study of History*, Arnold Toynbee traces a common pattern in the

lives of certain great creative figures like Moses, Saint Benedict, Peter the Great, and Lenin. They had all left the scenes of their youth, spent an interval in solitude or in entirely strange surroundings, and then returned to rise to some occasion of social crisis, to meet the challenge confronting the society to which they belonged. Churchill falls into that pattern, being for so many years, in the prime of his life, ostracised by his own Party and politically frustrated; and never more so than during the appeasement years prior to the Second World War which he so clearly foresaw and during which he returned from neglect to dominate the field at home and abroad. He is thus the most recent example in history of Toynbee's "Withdrawal-and-Return" theory.

(b) approved prospective candidates; and
(c) the executive of the National Union of Conservative and Unionist Associations.

This body totalled in 1965 about one thousand. That the Conservatives in the Commons should have first say in the choice of leader is based on the fact that the leader depends on their support. In theory the meeting of the party might reject the M.P.s' choice; and in that event the M.P.s would have to ballot again.

The Effect of the New Procedure on the System of Government.—Mr. Edward Heath was elected leader of the party in July 1965. The new method of selecting Conservative leaders was a great change in our system of government. It marked the end of a secret ritual whereby a leader was lifted up above his colleagues by a Royal summons in which they themselves played no open part. There is thus a crucial constitutional change—power being conferred by the Parliamentary party instead of by Royal prerogative. The change from Mr. Macmillan and Sir Alec Douglas-Home to Mr. Heath marked a change from the amateur to the professional. It would be wrong to regard Mr. Macmillan as other than a professional; but he generated the Victorian view that it was best to have a well-educated gentleman at the head of affairs; and this view was realised in the image and promotion of Sir Alec. This pattern was broken in 1965. The Party seemed to be facing the view that to regain power they must narrow the social and financial gap between those who lead the Party and those who support it in the country. The traditional method of choice by "the customary processes" which had lasted for so many decades has been finally abandoned.

The General Election, 1966.—Against all the odds and expectations, Labour had governed for seventeen months with a majority over Conservatives and Liberals fluctuating between five and only one. Not only that, but when Parliament

Election of Conservative Party Leader.—A new procedure for choosing the leader of the Conservative Party was announced in February 1965 and it was first used in July of that year when Sir Alec Douglas-Home resigned. The following are the chief features of the new procedure. Ballots will be held among members of the House of Commons who receive the Conservative and National Liberal Whips; and the successful candidate will be presented to a meeting of the party for election as leader. This meeting of the party consists of:

(a) members of both Houses who take the Conservative Whip;

was dissolved it was entirely at the Prime Minister's own choosing. Such is the unexpected course of political events. It might reasonably have been held, and was indeed maintained by very many, that no government, short of a coalition could exist with a majority of less, say, than a dozen. But Mr. Wilson governed with the air of one commanding a secure majority, for he neither trimmed his controversial programme nor made the slightest gesture towards a coalition with Liberals. And he maintained this course against the particularly severe economic circumstances we have described; and against adverse changes in his Party's popularity. Mr. Wilson chose to appeal to the country on 31 March 1966 and Labour's recovery was complete.

The July '66 Crisis: some political implications.—As explained in the Economics section the Government, to save a further run on the £, declared in July 1966 drastic measures to deflate the economy; unemployment rose; and confidence in future expansion declined, causing business to cut back investment plans. Were there inherent reasons for the crisis or was it caused by external causes? The crisis seemed a recurrence of similar previous crises—the last being that before October 1964 when the Conservatives were in power. As this crisis was one of a series it did not seem con-

vincing that it was due to Socialist measures and policies, as some Tories said; nor, on the other hand, was the Labour claim convincing that the Government had been "blown off course" by an unlucky chain of events outside their control like the seamen's strike or the rise in copper prices. We had not seemed able to steer a sensitive middle course between a runaway expansion and a crude and wasteful recession. The Government in 1966 initiated a number of steps to be better able to chart a smoother course. These were to secure better information on which to base decisions; to strengthen planning machinery to carry them out; to stimulate modernisation; and to promote mobility and retraining of labour. But three major political questions remained to be solved to turn deficits into gold. Can we afford to continue to be the world's banker; and a world supplier of capital; and a world military power?

The By-elections of 1967.—In eleven by-elections in 1967 the Government lost five seats—four to the Conservatives and one to the Scottish Nationalists. (The significance of the rise of Scottish nationalism is discussed in Part II). The measure of the Government's electoral decline is emphasised by recalling that the Labour Governments between 1945 and 1951 did not lose a seat in 48 by-elections. The average percentage changes in the by-elections in 1967 compared with the General Election of 1966 were: Labour: −18, Conservative: +1·6, Liberal: +4·8 and the total Poll declined by 9·3 per cent. At the W. Derbyshire by-election, which took place shortly after devaluation, the Conservatives held the seat and more than doubled their majority.

Devaluation of the £, 1967.—In November 1967 the Government reduced the exchange rate of the £ against the $ from 2·80 to 2·40. The main object was to force the pace of exports in order to take advantage of the lower value of the £ abroad. In other words, the price of our exports to the foreign purchaser would be cut and we should therefore stand to capture a bigger slice of the market abroad. This devaluation in the exchange rate of the £ was accompanied by measures to deflate the economy at home. These measures included a rise in the bank rate from 6½ per cent to 8 per cent; the limitation of advances by banks to customers, except to priority borrowers, like exporters; restrictions on hire purchase regulations on sale of cars at home; reduction on defence spending by more than 100 million in the succeeding year; the withdrawal, except in development areas, of the extra amount received by manufacturers in the Selective Employment Tax premium; and other measures. This deflation was unfortunately the third time in three years that the Government had been forced to deflate the economy. This third squeeze, it is true, was less severe than in 1964 and 1966; but a third squeeze coming so soon after the others was a hard blow for the country to bear. All these economic measures are examined in the Economics Section (Part III); but we turn here to some of the political effects of the changes which, it was expected, would flow from the devaluation of the £ and the deflation of the economy.

Some Anticipated Consequences.—The main consequences expected were (1) a rise in the cost of living and (2) changes in employment. The cost of living was expected to rise by 3 to 4 per cent, due of course to the rise in cost of imports (food and all other imports, including the raw materials for the manufacture of goods for consumption at home). Changes in employment would flow from the diversion of effort to the export trade and from the restriction upon industry by dearer raw material, dearer loans, dearer transport, and other costs, and by cutting in the state industries. There were three psychological factors: (1) uncertainty as to the effects on employment; (2) uncertainty as to extent of material losses to be borne; (3) nevertheless, the hope that in the long run general prosperity would be higher.

Past Devaluations of the £.—There have been three devaluations in recent times—1931, 1949, and 1967. The first was carried out by a National Government, the other two by Labour Governments who chose the step as an alternative to stiffer deflation. The devaluation of 1931 (which followed the overvaluation of the £., held to be disastrous, which Churchill made in 1925) was very successful in enabling us to increase our share of world trade so that we suffered less than the U.S. or Germany in the great world depression of the thirties. Since then it has been realised that to change the currency rate is a technical matter; it is not a sin to be shunned, however great the cost, but a process of control or management to be decided after balancing advantages and disadvantages. The 1967 devaluation marked a change in political attitudes. We elected to make our domestic expansion more important than our world rôle as banker or policeman.

Party Political Consequences of Deflation.—There had been for a long time a conviction expressed in favour of devaluation by many Labour and Liberal M.P.s and by sections of the press and economists. But this step had been vigorously and repeatedly ruled out both by Mr. Wilson and by Mr. Callaghan, his Chancellor of the Exchequer. So recently as July 1967, the latter had declared that such a step would be "a flight from reality." When, therefore, the step was at last taken the question was asked why the change had not been made before, whether the sacrifices caused by freezes and squeezes had been unnecessary and how politicians could justify regarding as beneficial something which they had so long condemned as bad. Public opinion was clearly critical of both parties. The section of Labour Members of Parliament who had been critical of the Government's refusal to devalue rallied in support. The Opposition was hostile on the twin grounds that the sacrifices of the last three years, including the increase in unemployment and the extra £1,000 million in extra taxation, had been in vain and that the Government could not be trusted not to fritter away any advantages which might accrue. Mr. Heath said that the Government had devalued "in the worst possible way at the worst possible time." The Government, said Mr. Heath, blamed everybody but themselves—the seamen's strike, the dock strike, the Middle East war. But, as we have said, both parties were held to have made grave errors in the adjustment of economic factors; and both parties had unfortunately succumbed to the temptation to make political capital out of the failure of the other. The truth seemed to emerge that the management of economic factors was a relatively new technique in our history; that all parties deserved sympathy in their efforts to tackle the complex problems; and that, whatever mistakes both sides had made, the country's welfare required that the hands of everybody should be strengthened, and not impaired, in drawing the maximum benefits from the new direction imparted to the economy in 1967.

Mr. Callaghan Leaves the Treasury.—Mr. Callaghan had submitted his resignation shortly before devaluation was announced on 18 November 1967 but it was not made public until 30 November. His reason for resigning was that a Chancellor must go if he breaks his word; even if he breaks it under duress. Before devaluation he had assured some of Britain's creditors that their sterling would keep its value. Devaluation meant that he had broken his word. He changed places with Mr. Roy Jenkins, Home Secretary. At the Home Office reforms on parole and suspended sentences had been introduced (in the Criminal Justice Act); the reform of betting and gaming was in train; the reform of police administration; the modernisation of prisons; and changes in prospect of the 1965 Race Relations Act, as we shall hereafter explain.

When is a String not a String?—On his first day as the new Chancellor of the Exchequer, 30 November 1967, Mr. Roy Jenkins was asked to explain whether the International Monetary Fund had attached "strings", that is conditions to the standby credit being provided for Britain of 1,000 million dollars. He denied that there were strings.

After his questioning in the House he published the Letter of Intent sent to the I.M.F. by Mr. Callaghan on 23 November. It became a matter for argument whether the terms of that Letter could be interpreted as deflationary strings. The particular aspect which we deal with here is the political one whether Britain had in fact yielded an element of its sovereignty to creditors. It was asked whether bodies of international bankers, subject to no democratic control, should have such influence as they were acquiring over the policy of an elected government.

Reduction in Public Spending.—The next stage was the series of cuts in public spending announced in January 1968. These were expected to reduce public spending by £300 million in the next financial year and by £416 million in the year after. Economics were most drastic in the defence field with the cancellation of the order for 50 F-111 bombers and a complete withdrawal of forces from Singapore, Malaysia, and the Persian Gulf by the end of 1971. At home the raising of the school leaving age was deferred for two years, from 1971 to 1973; and National Health prescription charges were reintroduced with exemptions. These two sets of changes, introduced primarily for financial reasons, marked two new principles. The withdrawal from the east of Suez by 1971 marked a momentous change, and represented the third great recognition in recent years of the trend of history—the other two being the decision of the Attlee Government to give India independence and Mr. Macmillan's recognition of the wind of change in Africa ten years back. The alterations in the policy on prescription charges and recovery, from those who did not need them, of family allowances exemplified the other change, namely the idea of selectivity in social benefits.

The Decision to Impose an Incomes Policy.—In his Budget speech in March 1968 the new Chancellor, Mr. Roy Jenkins, announced that the Government had decided to impose a much firmer policy for prices, incomes and dividends backed by extended statutory powers, at least until the end of 1969. There would be a ceiling of 3½ per cent on increases in all forms of remuneration, but excluding increases directly related to the amount of work done. The new Minister of Employment and Productivity, Mrs. Barbara Castle, responsible for carrying through Parliament the controversial prices and incomes legislation and of reconciling the unions to the new compulsory provisions, emphasised the possibilities of higher earnings in return for higher productivity. *See also* C29(2).

The Herculean Task of Government Today.—It was clear in the early months of 1968 that many of the grave issues confronting the Government perplexed not only the party in power but the opposition too. The widespread controversy over the immigrants from Kenya was only one example of the way both sides of the House were very understandably torn by differences and doubts. The division lists in the lobby on that occasion cut right across party. Of all the comments made in the public discussions on the Government's general record two cardinal inferences remained unstated. One was that in recent years the sphere of Government has widened and this necessary extension of Government involves a responsibility which is different not only in degree but in kind. For example, the need to work closely with industry and, of course, both sides of industry, at a most critical juncture makes demands on Government of an unprecedented nature and imposes strains which earlier Governments did not know. This is only one example of the wholly novel responsibilities before Government, to be shouldered on top of all their traditional tasks. But worse. The very sequence of political problems is rapidly quickening and incurs bewildering and novel repercussions. Account must now be taken of events which may occur anywhere in the wide world, bringing instant reactions by telephone, television and other means which earlier Prime Ministers like Gladstone, Campbell-Bannerman, Asquith or Baldwin could hardly have imagined or perhaps sustained.

2. WORLD PROBLEMS AND EVENTS.

World Hunger and Poverty.—It is important to know whether the gap between the rich world and the poor world is getting wider or narrower. The evidence is that it is getting wider. The rich world comprises North America, Europe, the Soviet Union, and Australasia; and broadly the poor world is Asia, Africa, and Latin America. (It will be seen that this is rather a different division from that between the so-called free world and the communist world; and it is likely to prove a more important division). Overall wealth (the gross national product) has since 1960 been increasing at 4·7 per cent each year in the rich world and 4·4 per cent in the poor world. But this statement does not contain the vital factor of what the growth was *per head*. The poor world is vaster than the rich—it contains 2,500 millions of people; and this factor is crucial. We are told that in the poor world gross domestic production *per head* is rising by only 1·4 per cent a year. If population continues unchecked the poor world may cease to have any growth *per head* at all by 1975 and steady impoverishment will set in. The evil is not population growth as such but growth in the midst of poverty. The population of the United States is rising, but so is its prosperity. What the poor countries cannot do is to supply sufficient houses, clothes, domestic and medical apparatus to its people, except by buying from abroad, and this cannot be done on anything like a sufficient scale. Sheer starvation remains a threat to many countries, with a drift of unskilled and unemployed to the slums of cities. Further, the ratio of unproductive people in the poor countries is very large: one Indian in every three is under the age of 10; many women are engaged in producing a child a year; and illness—especially blindness—prevents much of a contribution to a country's effort. A crucial difference between the rich and poor countries is that in so many of the latter the conditions for progress do not exist and are unlikely to be created without a social revolution which the assisting countries are unlikely to foster. Chiefs, landowners, and moneylenders do not encourage change. Interest on loans have to be paid. Prices of the primary products exported by poor nations often swing against them. We come back to the fundamental point that the difference between the two worlds is not only a difference in material terms; the lack in the poor world is the expectation of improvement. Few nations in this other world have reached the point where the circle of continuous poverty has been broken—the take-off point, as it is called. The exceptional countries which have done so are Mexico, Japan, and Israel—all with the help of considerable aid. We may reasonably suppose, too, that China has now reached that point, unassisted by aid; by a dramatic effort she has found the necessary investment from her own resources.

Population and the Supply of Food and Natural Resources.

The future relation between population and food and resources is an obviously vital aspect of the world's currently high rate of population growth. Broadly speaking, there are two opposed schools of thought, the one contends that with scientifically directed exploitation the earth's resources are large enough to solve the food and population problem, the other that there is a real and early danger of the demand from increased population outstripping the supply from resources. If a much greater degree of political compatibility and fluidity of trade between nations could be achieved, the world could probably support the existing growth rate of population of 2 per cent per annum for a century or so without making too many speculative assumptions about scientific and technical developments. National boundaries and international rivalries cannot however be ignored, and serious analyses indicate that the population of some of the more crowded countries of Asia, such as India, already face the grim possibility of being condemned to a lasting state of undernourishment and malnutrition, unless successful and simultaneous action is taken both to reduce the rate of population increase and to improve agricultural and industrial productivity.

Political Aspects of Needs and Aid.—The needs of underdeveloped countries and the aid given to them by Britain and other countries are discussed in detail in the Section on Economics (G10). Some political aspects of this subject are discussed here. It is becoming the practice to call the "underdeveloped" countries the "developing" countries. The phrase should not be allowed to soften the stark fact that two-thirds of the world's population command less than 20 per cent of the world's resources; that no nation, save France, contributes much above 0·6 per cent of national income to assistance; that the bold effort, which began in 1960, by the introduction by the United Nations of the Decade of Development is stagnating; and that, rich Atlantic nations apart, nations do no more than keep pace with growing population. The political effects are grave. Mr Robert MacNamara, lately U.S.A. Defence Secretary, reminded us in 1967 that "90 per cent of all the world's troubles which could escalate to general war occur in the poverty stricken areas." The irony is that an attempt is made to bomb such troubles out of existence. The developed world (Western and Communist) spent something like 150,000 million dollars on war in Vietnam in 1967. If it had been suggested that foreign exchange of this order should be spent to encourage growth the proposal would not have been seriously considered. It is true that war stimulates demand in the developed world and revolutionises technology and invention; but we do not seem able to stimulate world-wide demand in a peaceful creative way. For war the rich nations can throw in immense treasure. As Barbara Ward says, we get roast pig by burning down the house, like Charles Lamb's proverbial Chinaman. The rich part of the world has not succeeded yet in investing adequately in poorer countries in a rational planned way, although the operation is for mutual benefit; given a war, however, treasure is thrown in without much scruple. How, then, can peaceful work evoke the same drive and scale?

A World Strategy for World Growth.—With these considerations in mind, Barbara Ward, in the second Tagore Memorial Lecture given in London in September 1967, pleaded for a genuine long-term strategy for world growth and world wealth and that such international action should be at the top of Britain's priority list. It might seem odd to make such a plea in the middle of Britain's economic crisis and the Atlantic world's general disillusion with international assistance to economic development; even more odd, perhaps, to specify the details of such a strategy like estimating the capital needed for world growth. But she asked how else wealthy powers, and Britain in particular, proposed to cope—in terms of enlightened self-interest or constructive vision—with problems which will not simply take themselves off the surface of the globe. The critical need is the ability of our planet to plot its own survival; and an imaginative programme of world development has more chance of keeping humanity in business than any alternative known to us today. Britain's difficult economic condition was not a reason for refraining from such bold action; on the contrary it was a special reason for such action. Programmes of foreign aid are likely to result in high orders for British industry. We had gained more exports from the International Development Association than I.D.A. had received in British funds. This division of the two worlds, rich and poor, is surely one of the most critical problems of this century; and we may take some comfort from the thought that it does not seem to have the inherent intractability of one or two other problems like disarmament and race. Moreover, it is analogous in nature to the division of Britain in the 19th century into what Disraeli defined as the "two nations—the nation of the rich and the nation of the poor." This condition was ameliorated by a national feeling and a national sense of disgrace. It would therefore be in this tradition for Britain to declare that this small planet cannot survive half wealthy and half in stagnating poverty.

UNCTAD Meeting at New Delhi 1968.—The United Nations Conference on Trade and Development was due to meet in February 1968 to discuss improvement in the markets between developing and developed countries. They planned to discuss more stable prices for primary products (which can vary from 15 per cent to 20 per cent from year to year); and easy access for goods to developed markets.

The Doubling of Population: the 1968 statistics and forecast.—Based upon figures supplied by the United Nations, the Population Reference Bureau at Washington announced in March 1968 that the world's population was increasing by almost 200,000 people a day and was expected to reach 7,000 million or more by the year 2000. World population on 1 January 1968 was estimated at 3,443 million. The 3,500 million mark was expected to be reached by 1969, the 4,500 million mark by 1983. The most rapid growth rate was in North and Central America. The Bureau found that nearly one-third of the world's population was under 15 years of age. India, the Soviet Union, the United States, Pakistan, Indonesia, Japan and China accounted for 58 per cent of the world's population. About one-third only of the world's population live in "have" countries.

Europe.

France and de Gaulle.—One of the biggest changes in France after the war was the wiping out, as a serious factor, of the Radical Socialist party so powerful before the war. The newspaper reader must not be misled by the titles of foreign political parties—the Radical Socialist party was not radical and it was not socialist, giving those terms the meanings they have in England. They never regained their place in the Fourth Republic which spanned the years 1946–58. There was one hopeful spell when Pierre Mendès-France made a vigorous attempt to reform the party. In 1958 General de Gaulle, who had had a brief period of power in 1945–46, established a semi-presidential system with himself as President, taking certain powers away from Parliament and thus opening France's Fifth Republic next year.

De Gaulle Elected for a Second Term.—The French President's seven-year term ended in December 1965 and although he had then reached the age of seventy-five he submitted himself for re-election. He was opposed by two candidates who needed to be taken seriously (M. Mitterand and M. Lecanuet)—certainly in their combined effect—and two negligible candidates. De Gaulle took the encounter rather too casually and was forced to fight a second and straight fight with M. Mitterand, the left-wing candidate, who had secured the second position in the first ballot. De Gaulle won, as was to be expected, but had to content himself with 55·2 per cent—13 085,407 votes against M. Mitterand's 10,623,247.

What has de Gaulle achieved?—What, despite his questionable methods, did de Gaulle achieve during his first term of office? First, he steadily brought the war in Algeria to an end, despite all the hopes reposed in him that he would suppress the independence movement. This was a tremendously courageous achievement; and what was equally courageous he brought France through the threat of civil war precipitated by those who were for continuing force upon Algeria. The drive to economic recovery had, it is true, commenced before he came to power. But on the political side he reasserted French spirit and struck out upon a lonely path, building his nuclear force without receiving technical knowledge from America (as we had).

De Gaulle's Reckoning with the "Anglo-Saxons."—The key to de Gaulle's foreign policy is his conflict with the Anglo-Saxon allies, against whom he had fought all through the war itself. A narrative and an analysis of his "hour of reckoning with the Anglo Saxons" will be found in an unusually compelling and revealing biography *The Three Lives of Charles de Gaulle* by David Schoenbrun (Hamish Hamilton). (The three lives, very different ones, are de Gaulle as a soldier in the Third Republic, as the liberator in the Fourth Republic, and as the creator of the

Fifth Republic.) Mr. Schoenbrun's thesis is that de Gaulle, from June 1940 to May 1945, had fought a war within a war, an uncivil war with the Anglo-Saxons behind their united front against the Axis powers. De Gaulle alleged in his memoirs that the war-time allies, freed of the necessity of union against the common enemy, set themselves "to relegate us to a secondary place among the nations responsible for conducting the peace." He added, "I have no intention of letting this happen." Thus the first uncivil war lasted five years, from 1940 to 1945; the second uncivil war broke out in 1958 and is now—in 1968 in its tenth year. It has grown more uncivil each year. The boiling point of the first was the intervention of British troops against the French in Syria in 1945. It was never forgotten, and the uncivil war broke out again in 1958 when de Gaulle returned to power. The conflict was the more open because by that time the fear of Russia and of China, which might have bound the Anglo-Saxons and France more closely, had diminished.

The Right to Participate in Decisions.—Recovery by France having been accomplished by 1958, de Gaulle was determined that France should "assume its historic rôle in world affairs." She could therefore no longer assent to delegating to the U.S. exclusive authority to make the vital decisions for the defence of the free world everywhere in the world. He wanted not only the right to participate but the official and public recognition of that right by the creation of a three-power organisation to take joint decisions on global problems. The United States declined. Next year came de Gaulle's next step—the withdrawal of naval units from NATO's Mediterranean Command. The following year, 1959, de Gaulle announced that France would proceed to build an independent national atomic force. In 1962 when Kennedy proposed Atlantic partnership with Europe, de Gaulle replied with a plan to group the Western European nations into "an organisation that would be one of the three powers of the planet." In January 1963 de Gaulle rejected an offer by Kennedy to make American *Polaris* missiles available to them but to be assigned to a multilateral Atlantic force. Macmillan accepted a similar offer at the Nassau Conference. The division between de Gaulle and Macmillan was thereupon wide open. At the beginning of 1963 the General slammed the door to the Common Market in Macmillan's face and refused to sign the atomic test-ban treaty. Exactly a year later de Gaulle recognised Communist China which must have angered the United States deeply. In 1965 de Gaulle left SEATO, the South-east Asia Treaty Organisation; and next year NATO was asked to remove its headquarters from France. The agreement in 1967 between Britain and France to go ahead with the variable geometry swing-wing fighter plane, to collaborate in building military helicopters, and the signing of an agreement on the Concorde, the supersonic airliner, were hailed as a hopeful augury.

De Gaulle's Continuing Antipathy to the Anglo-Saxons.—De Gaulle's antagonism to America and to countries who he thought were unduly influenced by that country, so far from abating, was lifted to what was described as all-out "war" during 1967—on the monetary front, in the Common Market, on Quebec, Vietnam, the Middle East, and other aspects. At his press conference in November 1967 he asserted that membership of the Common Market was incompatible with the economy of Britain. Britain must undergo a fundamental and radical transformation before she could hope to become a member of the Community. He discussed prospects of technological co-operation with Britain. He maintained his intransigent support of French Canada and declared that it would be necessary to change all the institutions of Canada to wipe out "the Anglo-Saxon dominance" and bring about, perforce, a sovereign Quebec. While disclaiming responsibility for the speculative pressure against the dollar, which was mounting to an intense pitch in the days before he spoke, it was clear that he was not displeased by it. In fact "the squalls which are breaking out at the moment" might end up, he said, with the reestablishment of "a monetary system based on the universality, immutability, and impartiality which are the privileges of gold." He complained that the massive outflow of dollars had enabled the U.S. to take over control of many French concerns—due not, he said, "to the superiority of the U.S. but to the inflation which it is exporting to other nations under cover of the gold exchange system." He analysed Britain's political place in the changing world; he thought we were "in jeopardy"; and he did not conceal that this did not disturb him. "The English people no doubt can see more and more clearly that its structures, activities, and even its nationality are from now on put in jeopardy in the great movement which is sweeping the world—in face of the enormous power of the U.S., the growing power of the Soviet Union, the renascent power of the continental nations, the new power of China, and the growing centrifugal movement apparent within the Commonwealth."

Adenauer and Western Germany.—A notable personal achievement of the last two decades was Dr. Konrad Adenauer's Chancellorship of the West German Federal Republic for fourteen years until his retirement in October 1963 at the age of 86. He gave to a people who had not known democratic government for 15 years a new confidence and self respect. He committed himself to constitutional government despite the fact that he was a natural autocrat. Under him Germany enjoyed the first period of stable government since the First World War. As a consequence of this new confidence Germany rebuilt prosperity from decay. His work in building a special relationship with France, culminating in a treaty of friendship, was a dramatic contrast to the long tradition of enmity with France through which he had lived. But while he succeeded in building his country into the Western community he remained intransigent over East Germany; and since a solution must be found it remained for a more imaginative successor to grapple with it.

Erhard and Kiesinger.—In September 1966, when financial troubles were developing, Dr. Erhard, Chancellor, tried to amend the constitution so as to curb the financial powers of the Länder. For this he needed a two-thirds majority in the Bundestag, which he could not secure. His place was taken by Dr. Kurt Kiesinger, Germany's third post-war Chancellor who was able to take office only by the fact that the Social Democrats agreed to join the Christian Democrats. Dr. Erhard had become Chancellor in 1963 as the most popular politician in the country; he left when Germany's rôle in world affairs was undecided and its internal political future dangerously uncertain. Erhard was a determined opponent of hysterical nationalism and was a loyal supporter of the Atlantic Alliance—indeed it was held that he encouraged ties with the United States at the expense of the Franco-German friendship treaty, which had not lived up to the hopes reposed in it. It was this factor which accounted for the enmity of the Bavarian wing of the Christian Democrats, called the Christian Social Union, the party of Herr Strauss. The C.D.U. put its weight behind Dr. Kiesinger's nomination for the Federal Chancellorship and Herr Strauss was suitably rewarded with a Cabinet post.

The Right-wing in Germany.—When the third annual conference of the National Democratic Party was held at Hanover at the end of 1967 it was claimed that membership had nearly doubled in a year—from 18,300 to 33,511. It had 48 seats in six State Parliaments and the party was organised in 466 urban and rural areas out of a possible 500. It expressed confidence in being able to secure between 40 and 50 seats in the next Federal Parliament, in 1969. The undisputed leader of N.D.P. was Adolf von Thadden who for nearly twenty years had been leading Right-wing movements. Despite his attempts to check those even more extreme than himself, for fear of scaring potential supporters, he failed to dissuade the party from accepting a proposal to reintroduce the death penalty and castration for sexual offences. The N.P.D. aims to defend by its own nuclear force a Germany which will embrace, if possible, not only Sudetenland but Austria and S. Tirol.

The Soviet Government in December 1967 sent notes to the U.S., British, French, and Federal German Governments giving warning of the revival of neo-Nazism in Western Germany, describing the N.P.D. as "the direct successor to Hitler's National Socialist Party."

Dr. Schröder and a German Nuclear Rôle.—Herr Schröder, the Federal Defence Minister, rejected demands from the Opposition, and from certain quarters of the Social Democratic Party also, that Germany's armed forces should abandon the desire to play a nuclear rôle. The Federal Republic, he said, had to be in a position to fight back from forward positions with its allies in the event of aggression; and that nuclear as well as conventional weapons were indispensable in such a situation. Bonn remained hesitant about signing a non-proliferation treaty; and asked whether, if such a treaty were signed, it could be reviewed after, say, five years.

Yugoslavia: The Release of Djilas.—As a part of the new wave of liberalisation sweeping Yugoslavia, Milovan Djilas, her most illustrious prisoner of conscience who had been in and out of prison since 1956 was released at the beginning of 1967. Djilas had been one of Tito's closest associates and with him led the fight against Stalin when the break came in 1948 over reluctance to accept dictation from Moscow. Djilas, however, went on from criticism of Stalin to criticism of Stalinism and examined the new bureaucracy of Yugoslavia's own Communists. He continued to publish abroad his judgments, notably in his book *The New Class*. The aim of Djilas is to free communism from monopolism and totalitarianism: and this is what is happening in Yugoslavia today. Thus Djilas on release found that many of his countrymen had accepted the views for which he was punished.

Yugoslavia Debates Idea of Two-party System.—Although Djilas was not free to engage in political activity his ideas, as we have said, were germinating; and in October 1967 Victor Zorza was able to report in *The Guardian* that the dim shape of the future two-party system was gradually becoming discernable. "Socialism remained the basis of any future system but would it not be more natural," asked a Yugoslav magazine, "even if both of them were Socialist?" The shape of party reform was due to be decided at its congress in 1968.

Spain.—A new Law—called an Organic Law—raised hopes in 1966 of some change in Franco's anachronistic and authoritarian rule in Spain. But in the following year Franco postponed the new trade union law and imposed fresh curbs on the freedom of the press. In October 1967 a "week of struggle" ended with over a thousand workers in detention. More freedom of worship has had to be conceded to religious minorities—a symbolic defeat for Church authoritarians holding Spain's educational system back. But the main questions remain: How has the Generalissimo been able to remain in power for so long? Is it the American acceptance of him? Have the balances from the tourist trade made him safe? Is it the fear of revolution after a desperate civil war? Is it the effective prohibition of the discussion of alternatives to him? What price has Spain paid for his régime?

Greece.—Fearing the confidently expected victory at the elections of 28 May 1967 of the Centre Union, dictatorial power was seized by the Right in the preceding month. Many politicians, journalists, and others were arrested, no charges in many cases being preferred. A rigid press censorship was imposed. The 26-year-old King was confronted with an immensely difficult task, the colonels of the Right junta not wishing for his abdication although they would have pressed forward with their policy even if he had. It was said that a Constitutional Commission would be set up to report on the terms of a new Constitution which was expected by December 1967; and this might present the King with another critical position if the junta made difficulties in tracing a new course or delayed. The new régime was naturally susceptible to foreign opinion. But a very important key was held by the U.S. since Greece has been described as an American protectorate. But the Council of Europe gave the Greek generals a warning. Four member countries complained that the new Greek régime had violated eight articles of the European Convention on Human Rights. The Council warned Greece that unless the Generals ceased to repudiate the values which the council exists to uphold Greece will be suspended or expelled.

The King Leaves.—Since this is a running chronicle the preceding paragraph has been left as it was written in the early autumn of 1967. The critical position of the King of Greece there anticipated as coming to a head in December did in fact arise; and the King, after an abortive attempt, to free himself of the military junta went into exile at Rome. The sequel to the warning given to the junta by the Council of Europe mentioned in the preceding paragraph is dealt with in some detail in the passage on Human Rights in Part II.

The Middle East.

The Middle East War of 1967.—The third Arab–Israeli war began on 5 June 1967. In the words of *The Times*: "What began as the usual spring exercises of the Syrian army, shelling Israeli settlements in Galilee, ended with the complete overthrow of the Middle Eastern balance of power." Israel destroyed the air forces of Egypt, Jordan, and Syria in a few hours, destroyed their three armies in six days, occupying all Sinai to the banks of the Suez Canal (which was therefore closed), the west bank of the Jordan, and the Syrian hills above Galilee. The war was a disaster for Britain, who, with America, was blamed for a catastrophe which, in the view of *The Times*, the Arabs had "brought on their own heads." Among other results, the Russians moved permanently into the Middle East, backing the Arabs. The toll of human misery was, and remains, too immense to imagine: at least 300,000 new and old refugees fleeing the occupied territories. And despite the cost of this human and material loss and distress the problem of Israeli–Arab hostility remains unresolved, liable to flare up again one day. Will this be one of those tragic, intractable problems like the Alsace–Lorraine problem or that of divided Germany, which drag their bitter way for decades with terrible consequences? In the following paragraphs we recapitulate some of the historic aspects of the problem; and one can only hope that by the time they appear the deadlock will seem, at least, less difficult to resolve. The benefits of co-operation could be immense; the consequences of continued enmity are incalculable.

Palestine.—It was not until late in the 19th cent. that there was a movement called Zionism to reestablish in Palestine a home for the scattered and oppressed Jewish people. They had been driven away first by Assyrian kings and, later, by Romans, who destroyed Jerusalem in A.D. 70. The Jewish state disappeared and the area passed from the Roman Empire to the Arab Empire and, later, to the Turkish Empire. Turkey was one of Britain's opponents in the First World War, during which (in 1917) the British Government declared its official support of Zionism in the Balfour declaration.

The Balfour Declaration.—Since the Declaration was so much discussed at the time of the war in the Middle East in 1967 (which happened also to be the jubilee year of the declaration) the text is here given. Mr. A. J. Balfour, then British Foreign Secretary, wrote to Lord Rothschild on 2 November, 1917:

> "H.M. Government view with favour the establishment in Palestine of a national home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-

Jewish communities in Palestine, or the rights and political status enjoyed by Jews in any other country."

Earlier in the war the Jewish people of Palestine had been assured that in the new world order they would be accorded self-determination with British help. The region of Palestine had been liberated from Turkish oppression after the Jewish population had suffered great privations and a heavy death-roll. The Balfour Declaration was approved by the League of Nations, which incorporated it in the Mandate, which they gave Britain, to rule Palestine, which Britain continued to do until 1948.

Jewish Migration to Palestine.—The wartime massacre of millions of Jews by the Nazis naturally speeded up Jewish migration to Palestine when they could get away. This movement to Palestine was sympathetically regarded in many countries, particularly in America. But the hostility of the Arabs for the Jews increased and Britain curbed the immigration of refugees. Some, denied entry by British officials to Palestine, deliberately sank their boat and met their end that way rather than return to the countries of massacre and persecution. The violence between Jewish and Arab guerrillas, however, increased; and in 1947 the British Government announced that it would withdraw in the following year and invited the United Nations to take over the problem. The Foreign Secretary at that time was Ernest Bevin.

U.N. Plan for Division of Palestine.—The United Nations adopted a plan, supported by America and Russia, to partition Palestine into Jewish and Arab States with Jerusalem internationalised. But the Arabs rejected the plan and the UN could not enforce it. Britain withdrew in May 1948, as she had announced that she would, and the Jews proclaimed at once, the new state of Israel, which was immediately recognised by America and Russia. Israel was then attacked on all sides by neighbouring Arab states.

Armistice Between Israel and Arabs 1949.—Although outnumbered, the Israelis fought desperately and, by United Nations mediation, were allowed control of more territory, including part of Jerusalem, than had been conceded in the 1947 partition plan. But the Arabs refused to recognise the existence of Israel or to come to any agreements with it. Indeed Israel was blockaded on three sides and border raids and Israeli retaliations continued.

Israel's Open Door to Immigrants.—The new Jewish state had been created after the tension caused by Britain's restrictions on immigration into Palestine, as we have explained, of those who were driven to seek a new life from the countries of Nazi terror. Once the new Israeli state was formed all barriers to Jewish immigration were removed. Any Jew could thereafter go to Israel and become a citizen. By intense devotion and enthusiasm, agriculture and industry have developed under great difficulties both of natural difficulties and external hostility and threats. The land has been fully collectivised in settlements called kibbutzim and workers have been organised in co-operatives; and this phenomenon has been described in numerous books by English and other writers.

Nasser and the New Egypt.—A new factor in the Middle East was introduced when the Egyptian Army revolted in 1952, overthrowing the monarchy, leading two years later to the emergence of Nasser as Prime Minister. In that year Nasser secured the agreement whereby all British forces were to leave the Suez Canal Zone by 1956. [illegible] did not become a democracy in any [illegible]n sense but the government runs all the basic enterprises of the country. In 1956 Nasser internationalised the Suez Canal Company as a reply to the withdrawal by the United States of its offer to finance the High Dam at Aswan. The attack by the British and French on Egypt followed, causing serious disagreement with the United States, which inspired international action to rescue Egypt. (It was while we were bombing Egypt that Russia suppressed a revolt in the satellite of Hungary.) The nationalisation of the Suez Canal and the building, with Russian help and finance, of the High Dam are the two most important of Nasser's actions.

Suez Canal.—The canal cuts through rather less than 100 miles of desert which separates the Mediterranean from the Gulf of Suez. Not till the 1860s was the canal cut, reducing by some 4,000 miles the length of the sea voyage to India and the Far East. The project was opposed by the British as costly and impracticable and most of the capital (and the engineers) were French. The British changed their attitude and bought what shares they could, however, in 1875. By a Convention of 1888 the Canal was guaranteed to be always open, in war and peace, to every vessel of commerce or war, without distinction of flag; although, in practice, certain restrictions were placed on movements of warships, troops, and military supplies. Britain's merchant ships were the most numerous users of the canal, and when Britain occupied Cyprus in 1878 and Egypt in 1882, the Canal was a factor in the strategy. British troops remained in the Canal Zone till after the Second World War. When Nasser nationalised the Zone in 1956 it was argued that he was legally entitled to act in that way; Great Britain and France, however, attacked the Canal zone in October 1956 and the Canal was blocked, being afterwards cleared and reopened under Egyptian management and control. The closure of the canal in the summer of 1967 cost Britain's balance of payments about £20 million a month, since oil had to brought more expensively from non-Middle East areas. "The growth of big tankers," said Mr. Wilson, "may very soon make the Suez Canal a rather pathetic irrelevance." But all the same he declared it as intolerable that any nation should keep the canal closed to international shipping.

The Suez–Sinai Conflict 1956.—It was in obedience to a demand by the UN Assembly that Britain, France, and Israel withdrew from the attack on Egypt and an international force of about 6,000 men was organised to help avert further conflict. When, in April 1957, the canal was cleared and in use Egypt not only insisted on full control of the canal but on the right to bar Israeli trade from the Canal. Egypt and Saudi Arabia said they would resume blockading the Gulf of Aqaba (a N.E. arm of the Red Sea), but in fact Israeli ships subsequently got through to their previously blockaded part of Eilat. A small UN force remained on the Gaza–Eilat armistice line.

Was the Balfour Declaration a Mistake?—It has been said that the Declaration was a disastrous mistake and that the British position in the Middle East would have lasted longer, that western democracy and the Arab world would not have suffered their bitter divorce, if only the Balfour Declaration had not been made. That is the view prevalent throughout the Middle East; the view accepted not only by the Arabs but throughout nearly all the Moslem world; and the view held by many people in the West. Mr. Richard Crossman, Lord President of the Council, who represented the British Government at the celebration of the fiftieth anniversary of the Declaration, described four tests by which its value should be judged. By applying those tests, he argued that the Declaration remained one of the greatest acts of Western statesmanship in the 20th cent. These tests, amplified below, related to: (1) the status of the Jew in the Western world; (2) the democratic quality of the Jewish state; (3) the co-operative and socialist living patterns evolved by the Zionist Jews; and (4) the vital rôle that Israel has to play in the Arab social revolution which has yet to come.

The Four Tests Examined.—(1) Those responsible for the Balfour Declaration—and they included Lloyd George and Churchill—were all deeply influenced by the view that Jewry would always

be tolerated or persecuted as a second class people because, unlike every other small people in the civilised world, it had lost its national home. The validity of this view was confirmed by events after 1945, when countries made excuses for not accepting the remnants of the concentration camps, including Britain, which controlled the entry to Palestine where Jews were anxious to accept them.

(2) Israel has succeeded in creating a living democratic way of life and is the one successful new democracy that has emerged since the Second World War.

(3) The immigrants to Israel did not live on the profits of cheap native labour but evolved co-operative patterns, their way of life differing from all other white settlers.

(4) Seemingly impossible things can yet be achieved in Jewish–Arab reconciliation and Israel has a vital rôle to play in the Arab social revolution yet to come.

The conditions for a real reconciliation include the neutralisation of the area and the non-supply of arms. In this Britain has a rôle to play, working through the United Nations—a rôle as vital as that of the authors of the Balfour Declaration.

The League of Arab States was established in 1944 with the principal aim of creating a joint foreign policy to deal with the problem of Palestine. By failing to prevent the establishment of Israel in 1948 the authority of the League suffered a setback and relations between Arab states deteriorated as responsibility for failure was thrown from one capital to another. The decay of the League has been followed by Summit meetings of Head of States and occasional meetings of foreign ministers. But failure of cohesion has been even greater than that of the League, since these meetings have made public not merely divergencies of views but divergencies of personality and temperament between Arab leaders. There was a clash between so called "progressive" or "revolutionary" régimes and the "conservative" or "reactionary" régimes. It was the former group which were the more military and, except in Egypt, they failed to implement socialist programmes. According to Mr. Cecil Hourani, a distinguished Arab, these countries have seriously damaged their economic welfare and they have not taken measures which would have given a progressive character to their régimes, at least on paper. Mr. Hourani says that not one of the "progressive" régimes has abolished polygamy; and he accuses them of trying to reintroduce a conservative interpretation of Islam into public life. Certain of the so-called "conservative" régimes have done much for their population in terms of economic progress and social legislation. Thus Mr. Hourani concludes that the classification into "progressive" as opposed to "reactionary" régimes has led to a senseless and dangerous conflict between some Arab governments. The real difference is between the rich and the poor countries.

An Arab on a Middle East Dialogue.—An unusual essay called "The Moment of Truth" was contributed by Mr. Cecil Hourani to *Encounter* (November 1967). Mr. Hourani, whom we have mentioned above, was for ten years a close advisor to President Bourgiba of Tunisia and was founder and director of the International Cultural Centre of Hammamet (Tunisia). In this article Mr. Hourani makes a powerful appeal for a new response to the responsibility facing the educated classes in the Arab countries. He asks that the sterile and irrelevant discussions, bitter divisions, and suspicions between Arab countries be replaced by mutual confidence and understanding, if the Arab world is to be saved from a rapid decline. In spite of the enlightened nature of this appeal, worked out with great penetration and foresight, for a fundamental change in every aspect of Arab thought and policy, its objective towards Israel is not only the containment of Israel but the destruction of its character of a Jewish state. He says that having won independence for part of Palestine in 1948, when Zionism was confined to a tiny territory which was strategically weak and scarcely viable economically, the Arabs failed to consolidate the advantage so gained by them. "We could have contained Israel, and with it World Zionism, for fifty years, after which Israel itself would have ceased to be a threat to us, and become just another Levantine state, part Jewish, part Arab, but overwhelmingly Oriental." So again, after the 1967 conflict, he hopes that Arab policy will lead to "the gradual transformation of Israel from a European-dominated exclusive Jewish state into a predominantly oriental Arab–Jewish state." If Israel does not withdraw to her pre- 5 June 1967 frontiers, the proportion of Arabs to Jews in Israel will be radically changed, thus facing Israel with a dilemma. "It will become a Jewish–Arab state" and "As we acquire some of their virtues and they acquire some of our defects, the gap between Arab and Jew will narrow, and in fifty years could almost disappear."

The Problem of the Palestine Refugees.—When the Israeli state was created, most of the Arab population left and were not permitted to return. Some 900,000 fled to Jordan, Lebanon, Syria, and the Gaza strip. In the twenty years since then, very few have been assimilated in the countries of refuge or found homes elsewhere. The Arab states have tended to oppose schemes for resettlement, claiming that such action would condone Jewish occupation of Israel. The tragedy of a million Arab refugees was thus deepened by the reluctance of Arab states who could have made plans for absorption, if they had so wished, instead of using the refugees to strengthen their political attitudes. International aid continues to do what it can; but only real co-operation between Jew and Arab can begin to remedy the disaster. The present number of refugees is in the neighbourhood of one and a half million.

UN Appoints Envoy to the Middle East.—Thanks to the efforts of Lord Caradon, British Ambassador to the UN, the members of the Security Council at last reached agreement, and unanimously, to send a special emissary to the Middle East, Mr. Gunnar Jarring, a Swedish diplomat, whose mastery of twelve languages includes Arabic. An active Arab scholar, he was not known to have sympathies one way or the other in the Middle East. Nasser criticised the Security Council's resolution to send Jarring as inadequate and Syria rejected it. Nasser repeated the formula he had declared at the Arab summit conference in September of "no peace, no recognition and no negotiations." The chief obstacle faced by the UN mediator was the mistrust by each side of the other's motives and ultimate intentions.

Aden.—The Government decided to evacuate the Crown Colony of Aden in November 1967. By that time the political differences between the NLF (National Liberation Front) and Flosy (Front for the Liberation of Occupied South Yemen) had become slender and Flosy duly received its *coup de grace*. Flosy, an amalgamation of nationalist parties, had been inspired by Egypt with whose support it was formed in January 1966. NLF was an indigenous reaction against a foreign directed force and it was as much opposed to Nasser as to Britain. After the Israeli–Arab war of 1967 Egypt's interest in Aden waned. The NLF wanted Aden as the keystone to its growing ascendancy in the shaikdoms. Britain's calculation that her withdrawal from Aden would bring the rivals together went astray. The independent Peoples Republic of South Yemen came into existence and the last British troops left on 29 November 1967.

The Soviet Union.

A Turning Point in Soviet History.—In 1961 Khrushchev publicly and dramatically completed the process which he had begun in 1956, of drawing a line under the Stalin régime and finally rejecting the cult of Stalin. This change was symbolised by the removal of Stalin's body from the mausoleum at the Kremlin. At the same time Khrushchev was confronted by an external challenge to his leadership of the Communist world—by China who believed that Russia was moving steadily away from classical communist doctrine.

Stalin had made the Soviet Union a modern industrial society and a great armed power. But

the arbitrary bureaucracy through which this had been achieved had, in Khrushchev's view, overrun itself. Radical changes became essential and Khrushchev attempted various steps—the scaling down of the secret police; the rebuilding of the administrative apparatus; the opening up of virgin lands; and a new theory that war was not inevitable. The legacy of the Stalinist era had been the concept of the "monolithic" party, that is to say, a party which, however torn by internal conflict, must never allow any open division of opinion and free debate, much less the formation of any groups expounding distinctive views. In the light of the trials of authors in 1966–7 the view was bound to be taken outside Russia that the process of deStalinisation had not gone quickly enough. In 1968, 220 dons at British Universities publicly protested against the treatment by the Soviet Union of her Jewish population.

Khrushchev Leaves the Political Scene.—The career of Nikita Khrushchev as Soviet Prime Minister and Leader of the Communist Party came to an end—to the surprise of the world—in October 1964. Stalin had died in 1953 and the struggle for succession then continued for five years, when Khrushchev emerged with supreme authority. Upon Stalin's death a triumvirate of successors, Malenkov, Molotov, and Beria had decided to give the post of party chief—First Secretary—to Khrushchev, then a relatively harmless outsider, or so he was deemed by them. Beria, the all powerful police chief, was executed as a spy in 1953, Malenkov was forced to give up the premiership in 1954 and three years later both he and Molotov were expelled from the Central Committee. Khrushchev thereupon emerged with supreme powers, and became the talkative and jocular leader whom the world knew.

The Pattern of Change in Leadership.—The student of affairs may be puzzled by the strains and dislocations which occur upon a change of leadership in Russia. But this is less surprising when it is remembered that there is no constitutional manner of embodying a change of opinion or

policy in an alternative party or group of men. It will be seen from the diagram of events that after Lenin's death control was divided between the Secretary of the Party and the Premier for seventeen years, until Stalin combined both posts. After Stalin's death in 1953 control was again split (except for ten days) for another five years until, in 1953, Khrushchev who had been Secretary for five years combined the two posts again until 1964. The pattern repeated itself in 1964 Kosygin becoming Premier and Breshnev Secretary. A meeting of the Supreme Soviet in 1965 confirmed the principle of collective leadership. At the 23rd Soviet Party Congress held in April 1966 it was decided that the Praesidium of the Central Committee should go back to being the Politburo and the First Secretary should revert to General Secretary. The new 11-man Politburo has an inner cabinet of four members: Breshnev, General Secretary, Kosygin, Prime Minister, Suslov, the Party's theoretician, and Podgorny, the President of the Soviet Union.

A New System of Social Planning.—At the Supreme Soviet in 1965 Mr. Kosygin, the Prime Minister, announced a new system of Soviet planning. There have been only two movements of comparable importance since the Revolution:

(1) the beginning of Lenin's new economic policy in 1921; and
(2) the forced industrialisation through five-year plans in 1928.

Under the five-year plans the "command system" of production involving centralised planning in minute detail has held the field. It was the first object of every factory manager to reach or overreach his target and this might be regardless of profits or quality. Under the new scheme central planning is reduced. Managers are given broad targets and then left to produce as best they can to sell the goods and to make a profit. Sales volume and profits become the criteria of plan fulfilment. Thus the needs and desires of consumers acquire a new and effective importance. The new system seems a genuine attempt to reconcile three things:

(1) central planning;
(2) personal enterprise; and
(3) the wishes of consumers.

The State receives interest on long-term credits for capital equipment as well as a share of the profits. The rest of the profits is at the disposal of management for ploughing back and for incentive payments in the form of higher wages and special bonuses. This reform in the Soviet Union is clearly a compromise and like all compromises runs a risk of some instability. The student of affairs will therefore watch whether the system will issue into a greater liberalisation or to a re-imposition of the tight planning system. Another aspect of the compromise is the tension between the more flexible and empirical approach by the technocrats running the production ministries under Kosygin and the more dogmatic and traditional outlook in the Communist Party under Brezhnev.

Russia and China.—By the end of 1966 Russia was rallying support for a world Communist Congress to censure China and a turning point was reached in Sino-Soviet relations. Russia through *Pravda* accused China of duplicity in international relations—aggravating the situation, yet standing aside from the struggle against imperialism. Russia complained that her share in China's foreign trade had dropped from 50 per cent in 1959 to 15 per cent in 1965 whereas China's trade with capitalist countries was growing. The Kremlin complained of disunity over Vietnam.

World Meeting of Communist Parties.—But the possibility of a unity conference continued to elude the Communist movement. The steering committee which had been meeting in Moscow since 1965, consisted originally of 19 parties—reduced to 18 by the defection of Cuba. They were unable to agree to a properly constituted world conference because too many parties feared the damage which would be caused by the absence of China and its allies. On the occasion of the Soviet Revolution Anniversary celebrations it was decided to try, at any rate, to have talks about talks; that is, to call a preliminary meeting in February 1968 to discuss ways of finally calling a conference together. Difficulties were still anticipated from the extreme left (China, Cuba) and from the right (Yugoslavia, Rumania).

Russia and Conventional War.—In 1967–8 a basic change appeared in Russia's attitude to war, the Soviet High Command accepting, from all appearances, the possibility of large-scale conventional fighting in Europe. In Krushchev's time the assumption seemed that fighting in Europe would immediately burst into nuclear warfare. The new policy became known as "graduated deterrent" or "flexible response." Krushchev did not accept this wider strategy because of the cost beyond what he was prepared to spend. In

1968, however, the Soviet's defence budget was increased by 8 per cent to £6,200 million. This was the figure given to western correspondents. Industrial growth in Russia is rising more rapidly than in the West and it seemed that there was a debate at the highest levels as to the division of the national product between military and civilian. In 1967–68 it seemed that both wings, military and civilian, received some of the increased money available. In the words of Victor Zorza, one of the best of the analysts of Russian affairs, Russia opted for guns *and* butter.

The Impact of the Russian Revolution.—In the debate on this subject upon the fiftieth anniversary of the Revolution, Professor Arnold Toynbee made a striking contribution in his essay in the volume *The Impact of the Russian Revolution*, 1917–1967 (Oxford, for Chatham House, 45*s*.). One of the main effects, he said, of the Bolshevik Revolution has been to strengthen the American Right and weaken the American Left—thus helping to transform the United States from a revolutionary into a conservative country. Commenting on this David Marquand pointed out that although the Western world has not been much influenced by Soviet examples, it has been enormously influenced by what it has seen as Soviet threats. "Soviet imperialism in Eastern and Central Europe after the Second World War distorted the political development of Western Europe and the U.S. for a generation—and this, in turn, still further distorted the political development of Eastern Europe and the Soviet Union." Stalin produced Dulles and Adenauer; and these fortified Stalin and hindered deStalinisation, in what Marquand called the dialectic of negation.

Ferment in the Eastern Bloc.—In the spring of 1968 there was a series of unusual demonstrations in Poland and Czechoslovakia. In these demonstrations and riots students played a prominent part. Demonstrations by students in these countries fell into the world-wide pattern of student demonstrations and to that extent were not specially surprising. But it seemed clear that those in Poland and Czechoslovakia were impelled by an opposition to authoritarian régimes, thus breaking a long record of assent.

Peaceful Change under Communism.—The removal of President Novotny of Czechoslovakia by public pressure in March 1968 showed that peaceful change is possible under communism. The great debate in Czechoslovakia is about basic freedoms: how to ensure that the wishes of the people are transmitted upwards and truthful information from Government departments is made available to them. The Czech example will no doubt encourage other Communist countries to reform themselves. "Education saps dictatorships" was the comment of *The Guardian* when reporting on Czechoslovakia's new struggle for freedom.

The Changing Face of Asia.

The independence and unity of India on the one hand and the emergence in China of the Central People's Republic on the other form, with the Vietnam war, the three important political features of Asia. India and China have lived, historically speaking, in different worlds; their experiences at the hands of the West have been different; their recent developments and their present political systems are entirely dissimilar—the one a democracy and the other authoritarian.

Indian Changes under British Rule.—The pattern of her development after independence had been set during British rule. The main features were: the concept of law and the rule of law; a civil service superior to any known before in Asia; a system of education introduced as far back as 1835; English as a common language; and the growth of an intelligentsia (to use a word with a Russian origin) with a humanistic outlook and responsive to Western ideals and traditions. Important consequences followed from these changes. They enabled Hindu society to reform itself on the basis of modern ideas; to create an educated leadership; to modernise Indian languages; and to introduce modern science to India.

The Leadership of Mahatma Gandhi.—That the dissolution of British rule was made so peacefully, a miracle of modern times, was due principally to Gandhi who associated nationalism with ethical concepts, summed up in the term "Gandhism" and denoting pacifism, the value of the individual soul and humane ideas. He made India conscious of the social reforms which needed to be made and created the discipline to make a democracy able to carry them through. Gandhi's ideal of religious unity, though disrupted by the partition into the two states, Pakistan and India, made it possible for the new India to be a secular state, in which all religions and minorities had equal rights.

Nehru, India's first prime minister, symbolised India's highest aspirations. As a disciple of Gandhi he revered him; but his political outlook had been different. He was an enlightened liberal working towards a modernised, rational, democratic, secular state enjoying both the benefits of large-scale scientific organisation and the spiritual good of individual liberty. Under great strains this way and that he maintained neutrality in the face of world power blocs and embodied in his politics characteristics from differing régimes. He overtowered everybody in Indian public life and was one of the few great figures on the world stage.

Shastri succeeded Nehru. Lal Bahadur was born in 1903 into a caste lower than the Brahmins but equally dedicated to learning; "Shastri" is in fact the title of the degree he received. His air of gentleness was enhanced by his small size; and even by his adversaries in India he was regarded as a good, kind, and tolerant man. He faced problems as complex as any statesman, in the world's biggest, hungriest, and restless democracy. One of his biggest decisions was not to follow China in the nuclear weapons race.

Mrs. Indira Gandhi became Prime Minister of India in January 1966 upon Mr. Shastri's death at the Tashkent conference. Her father was Nehru and she must be regarded as the only daughter in history to have succeeded her father. She is not a relation of Mahatma Gandhi. In Indian families women have always been very highly regarded and India is one of the very few countries where nothing stands in the way of a woman going to the very top. Mahatma Gandhi so far back as 1929 had been uncompromising on women's rights and after Indian independence Hindu law was changed to satisfy his requirements on the status of women. Thus it was Gandhi who took women into politics and paved the way for the election in 1966 of Mrs. Gandhi, the world's most powerful woman. (Mrs. Bandaranaike of Ceylon holds the distinction of being the first woman Prime Minister in history.) Mrs. Gandhi is more radical than both her father Nehru and Mr. Shastri but clings to no "ism" and will confront each problem individually. Among those round Shastri who helped to guide India, she was by far the most cosmopolitan. Educated in Switzerland and at Oxford, she travelled widely with her father and as his hostess met many world leaders. Her family is Hindu and there is no doubt that she shares her father's devotion to the ideal of a secular state. She faced, on election, many difficulties; she promised to honour the agreement with Pakistan reached only a few days earlier at Tashkent where Mr. Shastri died, and she announced her willingness to negotiate with China if favourable conditions are created.

India and Pakistan.—The strained relations between these two countries have formed a sorrowful chapter. The concrete problems which have recently arisen between the two countries are not, in themselves, the cause of the strain but are the result of earlier deterioration of feeling. This deterioration was most severe in the year before actual partition, when tension between Hindus and Muslims exploded into communal warfare in Calcutta and in certain provinces

including the Punjab. This strife had roots which struck deep into history for the Muslims had, between the eleventh and sixteenth centuries, conquered by stages almost the whole of India. The Muslims had forestalled the British Westerners in bringing almost the whole of India under a single government. Therefore in the territories now in the Indian Union, the Hindus are masters in their own house for the first time since the beginning of the Muslim conquest of India so long ago. The partition of the sub-continent inevitably left large pockets of minorities of Muslims in India and of Hindus in Pakistan. The long history of conquest, of difference of religion and culture and the bitterness of partition itself—all this background accentuated problems which would not in themselves have been so difficult to solve. We must recall that Gandhi, Nehru and other Indian leaders did their best to heal communal strife.

In February 1968 a solution was reached by the arbitration body set up to find a basis of settlement in the Indo-Pakistan Rann of Kutch dispute. The tribunal decided that nine-tenths of the disputed territory (mainly salt desert) belongs to India, and one-tenth to Pakistan.

India: twenty years on.—Since independence India has gone through critical times. She has endured several bad years of harvest, including two drought years and, more recently, not only a threat of famine but an actual attack of it. She has been involved in two wars. She has lost two great Prime Ministers—Nehru and Shastri. Her currency has been devalued. Let us look first at what, despite all this, she has achieved. Her industrial output in the last fifteen years has been increased by one and a half times. Agricultural output has increased by two thirds in fifteen years. India can take pride in her hydroelectric dams and irrigation schemes, her oil refineries, steel plants, airlines, nuclear power projects, and so on. Schools have been trebled and the literary rate of 15% at independence is now 30%. But observers note first a feeling of disappointment in the country and a lack of faith in planning; and second, a feeling of hurt national pride. Taking these two streams of feeling in turn: the first, it is said, springs from a lack of will and resources in making effective new farming methods and methods of family planning, health and hygiene and this becomes increasingly critical as the population climbs to 500 million. The second element in national feeling is equally tragic, the feeling of hurt national pride, the loss of confidence in some countries which India had relied upon for friendship. The shock of the conflict with China in 1962 brought understandably a sense of disillusion and this was intensified when she became convinced—in her difficulties with Pakistan—of partisanship with that country of certain countries from whom she had expected sympathy. This general disillusion has forced her back upon the domestic problems which need attention; and this explains, it is said, India's apparent apathy to external problems like Vietnam. There is thus no strong interest in Afro-Asian co-operation or even in the Commonwealth. She is dependent upon the United States for food and aid, and her main concern is the threat from China and Pakistan and this concern fosters a demand for an Indian bomb.

The Indian Elections, 1967.—The monopoly of power enjoyed by the Congress Party of Gandhi and Nehru over India for twenty years was dramatically broken in March 1967. Between 60 and 70 per cent of the Indian electorate of 240 million used their vote. Half Mrs. Indira Gandhi's Congress Cabinet lost their seats, as well as three of the most powerful Congress Party leaders. Several State Governments were overturned. The result represented therefore an emphatic protest vote against continued Congress rule rather than a positive choice of a clear alternative vote. The protest vote went to whichever party seemed locally most capable of turning Congress out. The Congress Party was left with a very thin majority; but it remains the largest single party in the country and the only one, apart from the Communists, operating on a national scale. Mrs. Indira Gandhi was unanimously re-elected Prime Minister of India for a five-year term.

India Defers Fourth Five-year Plan.—This plan was due to begin in 1966; but its operation was delayed and it was confirmed in 1967 that it would not be introduced until 1969. The background to this setback are two years of disastrous drought, economic recession, acute inflation, and a sharp decline in foreign aid; and the possibility of insufficient rainfall in 1967 to affect crops. This situation, however, had not been relieved by any reform of laws restricting movement of grain from one state to another; by an effective programme in fertiliser production; or by adequate provision of incentives for foreign firms. But for India's welfare there can be no alternative to planning. Economic planning was one of the two main personal contributions by Nehru to India's political thought, the other being the concept of non-alignment in foreign policy.

China.—It is only in the last fifty years that the people of China have emerged from centuries of exploitation. It is very difficult for a Western observer to appreciate the dramatic changes which followed the overthrow of the repressive dynasty in 1911 and the advent of the Republic next year. The new leader, Sun Yat Sen, a great idealist and humanitarian, pitted himself against the age-long combination of landlords, military men, and reactionary scholars. For all his achievements Sun failed; or rather Sun's party, the Kuomintang, failed him. Power passed to the military remnants of the old Imperial army and Sun did not succeed in giving his party teeth for militant action for reform. Unfortunately, two years after Sun's death in 1925 his successor General Chiang Kai-shek opened an anti-Communist drive.

Sun's exhortations had been taken to heart by a poet and a scholar, Mao Tse-tung, son of a yeoman farmer from Hunan in the heart of China. Mao's success in raising peasant armies established his pre-eminence as a leader. The countryside helped the Communists to develop honest government. The peasants were ready to work in field and forge. They created a people's army superior to all other armies in Chinese history. Mao takes his place as the great leader of the Chinese Revolution.

Mao-Tse-tung and Other Leaders.—Mao's reputation is based upon his ability first as a military theorist (of guerilla warfare); second as a political philosopher (adapting Marxism to Chinese needs); and, third, as a more ardent champion of world revolution than the Russian leaders. Chou En-lai, the premier of the State Council, is the best known of Chinese leaders in the outside world and also knows the outside world better than his colleagues. It was reported that Lin Piao had been appointed to succeed Mao in due course. Lin Piao is 57 and is an extremely able Minister of Defence but suffers from poor health. The Red Guards are said to have demanded the impeachment of Liu Shao-chi, hitherto Mao's right-hand man, and Teng Hsiao Ping, secretary-general of the Party.

China's Cultural Revolution.—What were the features of China's cultural revolution, as it was called, of which so much was heard in 1966 and 1967? We first briefly indicate the main elements: (1) it was an organised demonstration of the young; (2) it was in favour of Mao-Tse-tung; (3) it disseminated Mao's essential teaching; (4) it was intended to keep alive revolutionary fervour; (5) it thus engendered a sense of China's special path of development; and (6) it emphasised opposition to "revisionism" leading to "bourgeois decay" as, it was said, had occurred in Russia. When Mao himself in December 1965 gave the first hint of a coming purge he styled it a "cultural revolution" against bourgeois and revisionist elements. Let us amplify the main elements in the movement.

Youth Emergent.—The organisation was directed to the under-25s who joined in mammoth demonstrations. Slogans and portraits of Mao appeared everywhere. Huge crowds of young people with red armbands thronged the streets in general excitement. Red Guards took a prominent part. This tremendous emotional support for Papa Mao gave that leader (then 73) the

assurance that his choice of successor would be accepted with confidence. Mao's essential teaching was disseminated by millions of copies of a little 300-page book of his selected writings, in a red plastic cover, carried by almost everyone and universally quoted, discussed, and preached. An objective of the movement was to stimulate the young who might otherwise take for granted the achievements of their elders made possible only by their past suffering and hunger. The revolution must be uninterrupted: the class struggle continued. This revolution was set upon a special path, being opposed to the super-Japan western-type technological society. At the same time the cultural revolution emphasised opposition to bourgeois attitudes and encouragement of revolutionary fervour. Beyond all this the young were urged to show initiative, to make suggestions for improvements, not to be afraid to criticise. The upheaval was described as a militant and not a militarist movement; the weapons being the tongue, the pen and the brush justified, it was argued, the description of the revolution as a cultural one.

A Return to Moderation.—In the winter 1966–7 it was impossible to discern clear outlines in the confused reports of upheavals in China. By March 1967 it was held by Mr. Victor Zorza of *The Guardian* that a gradual return to moderation was already evident in Chinese internal policies and that this gradual return was unlikely to be checked. It was being increasingly believed that the left-wing "cultural revolution" had been defeated. It was believed, also, that an important section of the leadership had favoured the revival of an alliance with Russia. (Relationship with Russia had become increasingly embittered since 1958 when Russia had refused to support China in a possible Communist takeover of Formosa. Since then Formosa has not been used as a spring-board for invasion of the mainland, despite the opportunity afforded by three years of famine or the half year of confusion ending in the spring of 1967.) If, as seems possible, the dispute ends between left and right wings, the newspaper reader will ask himself, as events unfold, whether the Sino-Soviet dispute shows signs of being softened and, possibly, dissolved.

China Tests Nuclear Missiles.—In October 1966, without giving details of the weapon, China announced she had tested a guided missile with a nuclear warhead, thus conforming roughly to the timetable for the development of her missile-nuclear capability anticipated by U.S. Intelligence studies. The Chinese announcement reiterated the assurance that China would never be the first to use nuclear weapons. According to American sources, China exploded her seventh nuclear device in December 1967 but Peking did not make any announcement, unlike the sequel to her previous six explosions. The U.S. Secretary of State for Defence said that China would have medium-range missiles "within a year or so." She would need long-range missiles to hit the U.S. from her own territory. As explained elsewhere, the American "thin" anti-ballistic missile defence designed to shield the U.S. from any Chinese missile attack into the 1980s was due to be deployed in 1968.

The New China.—Miss Irene Spink (who taught English in Peking from 1964 to 1966 and who subsequently travelled widely in China without restriction and saw the opening of the Cultural Revolution) reported to the Society for Anglo-Chinese Understanding in London in March 1968 that the days when millions in China died of starvation every year and education was only for the privileged few had gone for ever. Everyone, she said, gets enough to eat and every child learns to read and write

China and the UN. *See* Part II.

Vietnam.—In 1941 the Vichy Government in France gave Japan, who was our fighting enemy in the Second World War, permission to use French Indo-China as a base against us. Resistance groups were formed to win back independence and to overthrow both French and Japanese fascists. Japan collapsed in 1945, when the only organised troops were controlled by Ho Chi-minh, a Communist, who set up a Democratic Republic in the northern part of Vietnam. France was bent upon restoring her colonial empire in the south and next year war broke out between the French and Ho Chi-minh. Readers will remember the dramatic seige and capture by Ho's forces of the fort of Dien Bien Phu in 1954. As a result of a 14-nation conference on Indo-China at Geneva in the same year Vietnam was partitioned after a cease-fire, the country to be united after free elections. Laos and Cambodia became independent.

A declaration taking note of the agreement was signed by the following nations who took part: U.K., France, China, Russia, Cambodia, Laos, and North Vietnam. Unfortunately the United States refused to sign the agreement and South Vietnam refused to hold elections, but both affirmed that they would not use force to upset the agreement. There was thus a crystallisation into two Vietnams—Ho Chi-minh's Hanoi régime in the North and that of the Catholic nationalist Ngo Dinh Diem at Saigon in the South. The Diem régime was corrupt but John Foster Dulles sent in men and materials to prop it up. By 1960 the Communist guerrillas in the South, known as the Vietcong, had set up a National Liberation Front. For eight or nine years a civil war was waged in South Vietnam against a very unpopular dictatorship. All that time it has received United States military support and phrases like "the defence of freedom" in Vietnam are to be construed in the light of that fact. It is true, of course, that the North has been helping the rebels in the South. The position became increasingly untenable, and in 1963 the Buddhists rioted against the ruling Roman Catholic minority. The Diem régime which had savagely persecuted the Buddhists was overthrown by the military, the first of a number of military coups. In August 1964 a vessel of the U.S. fleet was attacked in the Gulf of Tonkin (off the North Vietnam coast) and American planes bombed North Vietnam installations as retaliation. This was the first of a series of bombing raids. At first the U.S. Government said that these were tit-for-tat raids but this specific basis was superseded by unrelated attacks. In March 1965 the American Ambassador in South Vietnam said that pressure against Hanoi would continue "until the enemy gives in." In June 1965 the State Department gave authority to the American military commander to use troops in offensive operations against the Vietcong.

U Thant at the United Nations, General de Gaulle in France, and important circles in the United States publicly demanded the reconvening of a conference, possibly by Russia and Britain who were co-chairmen of the Geneva conference of 1954.

Lippmann on Vietnam.—The wisest of commentators—the U.S. sage, as Alistair Cooke called Walter Lippmann—emerged from retirement to comment, at the end of 1967, upon the U.S. predicament. "We ought not to be in Asia with an army," he said, "We ought to be there as a trading, cultural presence. We should pull back to the mainland . . . The President is always vulnerable to the military. He listens to the others, but they win in the end. And Congress does not willingly appropriate money except for war." He said that if the U.S. had not intervened Ho Chi Minh would have been the President of a single Vietnam, a Communist State. But we do not know whether it would have been a Communist State like Yugoslavia or Bulgaria or Rumania or what. It would certainly be anti-Chinese. Mr. Lippmann said it does not follow that communism is an epidemic that will sweep over all Asia. He thought that the next President ought to be Governor Rockefeller, the ablest man to deal with the situation. The problems of poverty and race cannot be solved in the visible future so long as America pours billions into Vietnam. But under a good President one might recapture "the feeling of the momentum of the people on their way." Great leaders like Roosevelt and Kennedy had produced that: and Rockefeller was the likeliest to be able to do that.

McNamara and Westmoreland Leave.—Mr. Robert McNamara, Defence Secretary, accepted the presidency of the World Bank but agreed to stay at the Pentagon well into 1968. There was speculation that McNamara was going after mounting hostility by military advisers because of his "interference" in the Vietnam war. McNamara was not regarded as a dove but the hawks seemed glad he was going. He had become a counsellor of coolness and restraint; he rationed General Westmoreland in the supply of troops; and he opposed some escalations, which have happened, like the bombing of Hanoi and Haiphong town and some which, at the time of writing, have not yet happened, like the bombing of Haiphong harbour. Apart from his restraining influence in Vietnam McNamara will be remembered as one who improved the strength of the North Atlantic Alliance.

General Westmoreland, who took over as field commander in Vietnam in 1964, was recalled to Washington in March 1968. He was to become U.S. Army Chief of Staff at the Pentagon in July. A major review of the Vietnam situation was proceeding in Washington, made necessary by the military, political and psychological impact of the Vietcong Tet offensive.

A Sketch of Ho Chi Minh.—Relatively little has been written about Ho Chi Minh and this is remarkable of the President of the Democratic Republic of Vietnam which has figured so dramatically and tragically in post-war history. Let us therefore take a brief look at him; first, by recalling some of the external facts about him and, second, by a word of interpretation of his achievements and efforts. He is 78 and has been President of Vietnam since 1945, and this innings must be in the running for a world record. In 1911, as a young man of 21, he went abroad and for thirty years remained an exile from his native land. In France, in England, and elsewhere he studied the world-wide struggle against colonialism and saw the problem he was particularly interested in—the oppression in Vietnam—as part of the widespread colonial exploitation. Thus the Russian Revolution must have made a great impression upon him, illustrating that great changes were possible. Though for this reason he was sympathetic to Communism his first concern was the anti-colonial revolution in Vietnam. His main purpose therefore from 1945 was to weld together the two elements in Vietnam of nationalism and Communism. By unusual powers of organisation and ruthlessness he was successful in this. The evidence is that he did make a genuine and protracted attempt to negotiate independence with the French in 1945–46 and was prepared to make many concessions. The determination of the French to regain control of Indo-China after the Second World War must be regarded as one of the most tragic mistakes of the period. Austere, ruthless, advocating violence to achieve independence but not indiscriminately, being capable, as we have said, of making concessions, Ho remains a mysterious figure. The special character of his achievement is the dovetailing of the national and communistic elements in Vietnam, as we have noted; and the balance between the two has been skilfully maintained, however uneasy it may seem. Flowing from this is Ho's refusal to take sides in the Sino-Soviet conflict. His attempt to bind together nationalistic and communistic elements has been the more remarkable when it is seen that Vietnam is the only country in South-east Asia where this has been possible, the Communists having been checked in Malaya, in Burma, in Cambodia, and in the Philippines.

Steps in Vietnam History.

1940 Japanese invasion. France withdrew.

1942–5 Vietnamese engage in guerrilla war on invaders, Nationalists and Communists joining forces.

1945 Japan withdrew and Nationalists declare Vietnam independent.
Potsdam agreement makes Britain and China responsible for administration of Vietnam.

1946 Britain invites French to help and then withdraws leaving French in charge. Terrorist attacks on French who made massive reprisals against civilians.

1949 French instal Bao Dai as national leader.

1954 French defeated at Dien Bien Phu by the Viet Minh. Geneva Agreements.

1955 Boa Dai persuaded by U.S. to replace his prime minister by Hgo Dinh Diem (American educated Catholic) who in 1956 refutes Geneva Agreements and refuses elections.

1960–3 Three years of increasing conflict between Diem and the National Liberation Front formed to oppose the Diem regime.

1963 Neutral Buddhists appeal to Government for elections. Diem attacks Buddhists. Diem assassinated.

1964 August 2. Gulf of Tongking incident: US destroyer *Maddox* attacked by North Vietnam torpedo boats. Prompted Congress to give Pres. Johnson authority to step up American military intervention in S.E. Asia.

1965 February. Large-scale air raids on N. Vietnam opened.

1966 January. Major military operations by U.S. in the south.

1966 March 18. Hanoi bombed for the first time.

1967 February. Bombing of N. Vietnam increased.
May. Fighting in the demilitarised zone running between N. and S. Vietnam.
August. Bombing near Chinese Border.

1968 The Pope and U Thant again appeal for peace
January-February. Vietcong offensives in coordinated attack on cities in S. Vietnam, including Saigon.
April. President Johnson's limitation to the bombing of N. Vietnam and his offer of peace talks accepted.

Basic Facts about Vietnam.—The population is 32 million (N. 15·5, S. 16·5). Racial composition is 85–90 per cent Vietnamese origin, and 3 per cent of Chinese origin mostly in S. The land area is 129,000 square miles (N. 63,000, S. 66,000). The main religion is Buddhism 70–80 per cent, Roman Catholic 7 per cent (mostly in S.). The President of N. Vietnam is Ho Chi Minh and the Prime Minister Pham van Dong. The Government of S. Vietnam had been formed by military coup and as result of a limited election in 1967 the President is Lt.-General Nguyen Van Thien and the Vice-President Air Vice-Marshal Nguyen Cao Ky.

Indonesia.—In August 1966 an agreement was signed between Malaysia and Indonesia ending the three year "confrontation" between the two countries. The whole direction of President Sukarno's policy was reversed during 1966 by General Suharto, chairman of the praesidium of Ministers and Army C-in C., even though Sukarno was allowed to retain his powers as Head of State. Despite the President, Sukarto brought Indonesia back to the United Nations; ended the confrontation with Malaysia; restored some semblance of democratic government; and began to halt inflation. Sukarto had taken control when the army defeated a Communist coup in September 1965.

Africa.

Africa's Faltering Steps to Unity.—President Nyerere has confessed sadly that "Africa is in a mess." The disunity extends beyond Africa to the whole of the non-aligned world which appeared to have so much cohesion at the Bandung Conference of 1955. What is the cause? Is it the disappearance of forceful leaders like Sukarno, Nkrumah, and Nehru, and the fact that men like Tito and Nasser are not in the mainstream of Asia and Africa? Does the disunity support Nkrumah's contention that without his form of militancy Africans can only be pawns of the neo-colonialists? Has the leap to statehood been too quick? We must hope that the potentially rich countries of Nigeria, Zambia, Ghana, Guinea, the Ivory Coast, and the Congo will plan development

with poorer neighbours. But a little perspective will be salutary for European observers. After many centuries Europe has not yet completed by a very long way the evolution of nationalism, industrialisation, and supranationalism; the process in Africa has been at work only for about a couple of decades. We have insufficient reason to be self-satisfied; and future wellbeing both of ourselves and other peoples calls for understanding.

The Congo.—At the beginning of 1967 President Mobutu took over the entire Congolese operations of the Belgian Union Minière Company which for 60 years had mined copper and cobalt in Katanga. This "congolisation" was described by the company as "the largest grab in history". During 1966 there were two interesting declarations from the capital, Kinshasa (the new name for Leopoldville—Kisangani being the new name for Stanleyville): (1) in June 1966, the 6th anniversary of Congolese independence, Patrice Lumumba, assassinated in 1961 was declared a national hero and (2) that presidential elections would be held in 1970 by universal adult suffrage, including women. Tshombe made an abortive attempt to return in 1967 but was captured in Algeria. The use of mercenaries in the Congo introduced a new factor in 1967 and the ultimate fate of those who fled to Rwanda posed a further difficulty for African states.

Portugal was condemned by the UN Security Council in November 1967 and was called upon to put an end immediately to giving assistance to the mercenaries who had committed armed attacks against the Congo.

Tshombe.—It is difficult to deal adequately with Moise Tshombe in restricted space. His change in 1964 from rebel and outcast to Prime Minister of the Congo came as a shock and surprise. He had failed, as a rebel, to secure the independence of Katanga, the richest province in the Congo. It was in that province that Patrice Lumumba, the first Prime Minister of the Congo, was killed in 1962 while in detention near Elizabethville, the Katangese capital; and according to a United Nations Commission, Tshombe's Government directly or indirectly contributed to his death. At the beginning of 1963, after two outbreaks of fierce fighting with the UN, Katanga had been forcibly brought back into the Central Government and in June of that year Tshombe went into exile. Throughout Africa his name carried the same significance as Quisling's in Occupied Europe in the Second World War. Gradually, however, without once visiting the Congo he was able to attract allies to make him a strong rival to the Prime Minister, Adoula; and with the support of President Kasavubu and partly on the support of General Mobutu's Army he supplanted Adoula in 1964 and stood where Lumumba had stood just four years earlier. However, Kasavubu forced Tshombe to resign as Prime Minister in October 1965. President Kasavubu was himself replaced by General Mobutu soon after (November 1965).

The Assassination of Verwoerd.—Dr. Verwoerd, who was murdered in September 1966, while the members of the Commonwealth were assembled in Conference in London, was the man who gave form and substance to the idea of apartheid, led South Africa into a republic and took her out of the Commonwealth. He studied applied psychology in Germany and on return took an interest in politics, organising in 1936 a protest against the admission to South Africa of a shipload of Jews fleeing from Germany. He became a power behind the scenes in the Nationalist Party which, in 1948, ousted the Smuts régime on the slogan of apartheid. He succeeded J. G. Strydom as Premier in 1959, a year after being elected to the House of Assembly. The Bantu Self Government Act of 1960 provided for the division of the non-white population into tribal units, the abolition of their existing representation in Parliament and the creation of self-governing "native states." But the aim of apartheid, the physical separation of races is, apart from other objections, a dishonest myth, as the economy cannot be run without black labour. The call by The Pan-African Organisation for a nationwide campaign against the law requiring all African men to carry passes for identification led to the massacre by the police at Sharpeville. Verwoerd banned the two major African political movements, the African National Congress and the Pan-African Congress and most African leaders were sent to prison, proscribed or fled. Verwoerd was born in Holland, a land noted for its enlightened policy of racial integration; but after his return to South Africa from Germany he held the separation of races to be blessed by scriptural authority and, as a follower of the Dutch Reformed Church, carried his philosophy into politics.

Violence and Southern Africa.—Violence has begun to erupt over southern Africa. The indecisiveness over Rhodesia, the absence of serious economic pressure on South Africa and on the Portuguese, whatever the reasons for this policy, have encouraged those ready to use violence. And this applies to the advocates of violence on both sides, black and white. The guerrilla has suddenly become a reckonable factor, said Colin Legum, in a part of the world where, until a few years ago, black violence was unknown. Guerrillas are operating in South West Africa, in Angola, in Mozambique, and in Rhodesia. Until 1966 President Kaunda of Zambia—opposed to violence—was successful in denying guerrillas even passage through Zambia. But he has been unable to resist pressures. In this new and menacing situation Dr. Banda, President of Malawi, is in an anomalous position. He has ranged himself with the White Supremacists against the guerrillas by opening diplomatic relations with South Africa. He has become a Black ally of the White Front.

Rhodesia.—*See* Part II.

The United States.

The Assassination of President Kennedy in November 1963 at Dallas, Texas, shocked the entire world. The world recognised the growing mastery which this young man had shown during his three years of office in leadership and commitment to policies which promised increasing conciliation among nations. His youthfulness had galvanised hope in a world in which political decisions were so widely in the hands of leaders past their prime. He was the youngest elected American President (43) when he succeeded Eisenhower at the White House in January 1961, Eisenhower being then America's oldest President. Kennedy had had difficulties with Congress; and it was reassuring, therefore, that Lyndon B. Johnson, who as Vice-President automatically succeeded Kennedy, should have had the reputation of being a skilful negotiator in Congressional matters.

The Defeat of Goldwater.—Barry Goldwater, the Republican candidate, was decisively rejected by the American people at the Presidential election in the autumn of 1964. Lyndon B. Johnson, Democrat—"Ell Bee Jay"—had a majority of 15 million over Senator Goldwater.

In the new House of Representatives in 1964 was the largest number of Democrats since the Roosevelt New Deal years of the early 1930s. Thus President Johnson was given much greater prospects of enactment of his legislative programme. The United States is now committed to an expanding programme of civil rights for Negroes.

Cuba and the United States.—In 1961 the United States broke off diplomatic relations with Cuba with whom relations had been strained since the Castro revolution of 1959. Shortly afterwards two U.S. aeroplanes, but manned by Cubans, attacked the principal military bases near Havana, the capital. Two days later 1,500 invaders, Cuban exiles—armed, trained and largely controlled by U.S. agencies—landed on the island but were driven back. The United States intelligence service had assumed that the Cuban people would rise against Dr. Castro directly they heard of the landing. Controversy broke out in the States. Confidence in the new Kennedy administration was shaken for the affair was fundamentally alien to the American character. Relations were more bitter than ever, and, by the end of 1961, Cuba became a Communist state in the full sense.

The Crisis of the Autumn of 1962.—The world came to the brink of war during the last week of October 1962. President Kennedy had pledged the United States to take measures to oppose the creation of offensive military power in Cuba. On 22 October, upon alleged evidence of offensive Soviet missile sites there, he announced a blockade of ships (or more precisely a quarantine of ships) carrying weapons to Cuba. Some Soviet ships altered course thus avoiding a direct confrontation. The United Nations made proposals to both sides in preparation for talks; and shortly afterwards Khrushchev decided to dismantle Soviet missile bases in Cuba and ship "offensive weapons" back to the Soviet Union, the United States agreeing to give assurances against an invasion of Cuba which had been threatened.

Turn of the Tide for Republicans.—The mid-term elections in 1966—that is to say the Congressional election which falls between two Presidential elections—gave a shock to the Democrats and gave the Republicans three assets: (1) a strengthened minority in the House of Representatives which would restrain any further welfare spending, thus blocking progress of such Great Society legislation as medicare; (2) invasion of Republicanism in the South, for so long the one-party servant of the Democrats; (3) a revival of the regional strength of the party by winning the Governorships of five of the six States that carry to the Presidential nominating conventions the biggest blocks of delegates. The state of the parties were:

	New Senate	*Old Senate*
Democrats	64	67
Republicans	36	33
	New House	*Old House* *
Democrats	248	294
Republicans	187	139

* there were 2 vacancies (one D one R) at the dissolution of the old House of Representatives.

The Presidential Nominations, 1968.—Thus the mid-term election of 1966 rehabilitated the Republican Party which had been so sundered by the rout of Goldwater in 1964. It removed the balance of power from Goldwater and put it in the hands of more moderate men. It warned the Republican Party against putting forward extremist candidates like Goldwater. The large gains in the number of Republican Governors provided that party with a short list of Presidential candidates both for 1968 and 1972. Among these were Nelson Rockefeller (New York) and Romney (Michigan); but an alarming figure was the extreme Right-wing Ronald Reagan (California). The emergence of Reagan was the shock of the mid-term election—a minor film actor, sports announcer, Goldwater man, whose administrative abilities and convictions remained mysteries. He would fall to be considered for the 1968 Presidential nominations.

In the event, the picture had changed by the spring of 1968, when the likely Republican Presidential candidate seemed to be Richard Nixon (who had once been Vice-President and a Presidential candidate), Romney having withdrawn and Rockefeller having decided not to seek nomination. On the Democratic side it seemed that the candidature of Lyndon Johnson would be challenged by Senator Eugene McCarthy, who would be taking his stand upon the criticism of America's war in Vietnam, and by Senator Robert Kennedy who had entered the lists after the result of the New Hampshire primary election had shown that President Johnson was vulnerable. Then came the President's wholly unexpected decision, announced to the nation on 31 March, to initiate *peace moves in Vietnam and to lay down the presidency in January. This dramatic turn of events threw the presidential race into perplexed confusion.*

Assassination of Martin Luther King.—Within a week, on 4 April, Martin Luther King, the great Negro leader, moral teacher, and champion of non-violence in black America's struggle for social justice, was murdered in Memphis, Tennessee. It is ironic that he died with the passing into law at long last of the Civil Rights Bill that he had done so much to bring about. The new law is intended to end racial discrimination in the sale and rental of housing and makes the outlook for human rights look less bleak.

Latin America.

Latin American Solidarity.—A Conference of OLAS, the Organisation of Latin American Solidarity, was held in Havana in August 1967. (OLAS was created in January 1966 by the Organisation of Solidarity of the Peoples of Asia, Africa, and Latin America.) Although dedicated to solidarity the conference reflected some of the divisions existing among Latin American Leftists, some Communists (e.g. of Venezuela and Argentina) staying away. It was at this meeting that Stokely Carmichael, the U.S. Negro and advocate of violence against exploitation, appeared and claimed greater affinity with Asians, Africans, and Latin Americans than with his white fellow citizens. This claim is to be construed against two facts. First there has not been the same prejudice in Latin America against the Negro as in the United States; Brazil, for example, prides itself upon its multi-racial policy. Second, he was stirring up the dislike in Latin America of the U.S. though not of individual Americans. China was not represented at the Conference.

The Split in Solidarity.—We have said that the OLAS Conference reflected a split in left-wing groups in Latin America. This split is between supporters of guerrilla-led revolutionaries and older Communist groups using peaceful united front tactics. In this division Dr. Fidel Castro, the Cuban leader, put his support behind the guerrilla movement. He went further, attacking the Soviet Union for trading with bourgeois Latin American régimes. Castro (and Ché Guevara too) had remained neutral in the Sino-Soviet dispute; but his provocative attack at the 1967 Conference on the Soviet Union, which has been his main economic backer, leaves him in an exposed position.

Guerrillas in Latin America.—Guerrilla activity had been reported in Venezuela, Guatemala, Colombia, Peru, and Bolivia. Guerrilla warfare has broken out more recently in Nicaragua, which is virtually a U.S. colony. All this activity is not surprising in the light of the fact that there have been 15 right-wing military coups in Latin America since Fidel Castro first took power in Cuba. The guerrillas see from this fact that peaceful reform is an illusion. It was in Bolivia that Ché Guevara, a prominent guerrilla leader, was killed in October 1967. The movement thus lost one of its most experienced and charismatic leaders and it must have been a great shock and setback to it. His name will go down to history. He sounded a warning to Governments of the unjust plight of millions of people. At the same time the loss of Guevara may strengthen the bonds of those who question the wisdom and practicality of armed struggle as the only road to revolution throughout the Continent. Régis Debray was sentenced, soon after Guevara's death, to 30 years' imprisonment for being an associate of Guevara. The sentence was imposed despite the combined efforts of de Gaulle, the Pope, Bertrand Russell, and Jean-Paul Sartre.

Gunther Inside South America.—Readers of the problems of distant continents must have been delighted when John Gunther published his *Inside South America* in 1967 (Hamish Hamilton). Gunther's "Inside" books were world-wide best sellers—*Inside Africa, Inside U.S.A., Inside Russia, Inside Asia*, and so on. Now came the first full-scale *Inside* study after ten years. It is a long book but most readable, the ten countries being described in a vivid, racy, and intimate way which compels the reader's attention and captures both his imagination and his memory. Many general conclusions emerge. The population pressure is most important—by 2000, Latin America is expected to have between 600 and 700 million people as against 300 million in the United States and the problem of feeding will produce

grave political risks. In several of the ten countries nationalism has exaggerated ferocious impulses, demagogues coming to the fore and the army being given inflated powers. The absence of an educated cadre and of political stability arrests education and development. Fifteen million children have no schools, the life expectancy is about forty, adult illiteracy exceeds 50 per cent, countless towns and villages still lack such a primitive commodity as water, and peasants " ground down to torpor have to live for a day on what a North American spends for a shoeshine or a cigar." The principal economic preoccupation—at least in the three " ABC " countries of Argentina, Brazil, and Chile—is inflation. Stable economics will be difficult until the citizency learns to pay taxes and wealthy plutocrats give up exporting their capital to Switzerland. Anti-Americanism arises from fear of exploitation and fear of intervention—or what John Gunther calls " the old, big stick." Gunther's summing up is that every country there deserves a better government than it has. " In the long run," he says, " Communism—or chaos—is absolutely inevitable in South America, through revolution or otherwise, if the continent is not educated, democratised and developed. The price of freedom is modernisation and reform." The U.S. need to take the side of the *people*, even if a consequence of this is radical social change. Mr. Gott, *The Guardian's* man in Latin America, distrusted the rôle of the U.S. in that continent and said that the people there wanted to be left alone.

The Arms Race to Latin America.—There seemed a need for the major arms producing nations to subscribe to an embargo on selling arms to Latin American countries. After all, there are only two frontier disputes and they are minor—Bolivia's access to the sea denied by Peru and Chile and the frontier between Argentina and Chile. Nevertheless in 1967 the U.S. added supersonic jets to their arms supply to Latin America and the French began to supply fighter-bombers to Peru. Is the position that the danger facing the Governments of the S. American continent comes from their own people's impatience with the slow pace of economic and social reform? Should, therefore, the military be allowed to lobby for arms? Is not Latin America an appropriate and urgent quarter to control the supply of arms by cynical powers?

3. THE THREAT OF NUCLEAR CONFLICT.

Terms Used.—

A deterrent is a weapons system capable of causing such a degree of destruction to an attacker that it would be too high a price for him to pay for any advantages sought. Of course, the attacker may not know what destruction the deterrent could cause, so that what is important is not the owner's estimate of his deterrent but the potential aggressor's estimate of it. Furthermore deterrent forces must be able to strike back after an aggressor's missile attack. So there is a distinction between first and second strike weapons. The nuclear deterrent is said to be the ultimate deterrent, because nuclear weapons are the most advanced form of weapon.

The nuclear or thermonuclear bomb means a bomb or a missile with an explosive power measured in megatons, *i.e.*, one million times more powerful than bombs used during the Second World War. A ten megaton bomb contains the equivalent of a train of railway wagons filled with high explosive stretching from London to New York—and of course fall-out with its genetic effects.

The independent bomb. Independence, in this context, means the right and ability to launch a force alone against an aggressor. For this it is necessary to own and control thermo-nuclear weapons and be able to deliver them. The ability to deliver weapons, without which they are useless as a deterrent, raises crucial difficulties.

It is argued that the bomb, like earlier types of armament, is the ultimate guarantee of the nation's security; that without it we should not reach the conference table with other great powers; that it gives us freedom of action and, as such, is a safeguard against the possibility of a change in American policies which might leave us unprotected. The facts and policy of an independent nuclear deterrent have been seriously challenged.

ABM is the anti-ballistics missile defence system, whereby missiles are launched to destroy the missiles of the enemy—anti-missile missiles. At the end of 1966 it was known that the Russians had begun to establish an anti-ballistics missile defence system round Moscow. President Johnson was then under pressure to counter this with the deployment of an American ABM system which was already under development. This would entail tremendous cost. Moreover both the U.S.S.R. and U.S.A. realised that an ABM system can be countered by increasing the number and penetration of offensive missiles. Mr. Johnson in 1967 therefore proposed discussions between the two countries designed to prevent a race in anti-missile defence: and in March of that year the two countries agreed to discuss ways of limiting the race in both offensive and defensive missiles But within a few months the U.S.A. decided to build an ABM system. The facts, the effects, and the cost are discussed in later paragraphs in this section.

Other terms. *Escalation* is a term used for the belief that once a conflict begins which involves nuclear powers, the contesting parties are riding on an escalator from which there is no escape and rising to an all-out thermonuclear war. A weapon is said to be *credible* when it is trustworthy and it can be believed in for its purpose: thus it is sometimes said that the U.K. manned bomber force is credible only for a first strike. *Conventional* weapons and forces are other than nuclear. Atomic devices are described as *tactical* when they are in support of ground forces and *strategic* when they are part of an all-out major strike force.

The Partial Nuclear Test-Ban Treaty was signed in Moscow in August 1963 between Britain, the U.S.A., and the U.S.S.R. who undertook not to conduct nuclear tests in three out of four possible spheres—in the atmosphere, in outer space and under water. The fourth possibility—underground tests—was not touched by the Treaty, but it declares that agreement on such tests remains a desirable aim. Within two weeks 62 further States had signed it. President de Gaulle was sceptical. Since Russia and the U.S.A. had, he said, made hundreds of tests, some quite recently, he did not see what purpose new tests could serve. He put his finger on the fact that underground tests were not covered. The Treaty was denounced by China who wanted, she said, total prohibition and destruction of nuclear weapons. Looked at from the world of 1968 the Treaty takes on a disappointing aspect apart from the fact that France and China refused to sign. The " principal aim " proclaimed in the preamble to the Treaty in 1963 was seen by 1968 to be a dead letter, for the aim was said to be the end of the arms race, the end of *all* test explosions, and comprehensive disarmament. As we explain below, Americans and Russians were just carrying on by testing nuclear weapons underground.

Underground Nuclear Explosions.—There has been little hope of extending the test-ban treaty to underground explosions, despite the appeal of the United States to Russia to agree. The U.S. and Britain still disagree, with Russia over the question of identifying the nature of all underground explosions. The Western Powers insist that no foolproof method has yet been devised, and they cannot therefore accept a ban on nuclear underground explosions without a limited number

of on the spot inspections. But this is just what Russia is opposed to, on the grounds that this would amount to espionage.

The Spread of Nuclear Weapons.—Ever since 1960 there had been talks on how to prevent the proliferation of the bomb and the round of talks, which ended in August 1966, finished without any substantial new progress. The stumbling block was Russia's suspicions that despite declarations by America the arrangements to be made for the future of NATO would give Germany a finger on the nuclear trigger. In the autumn of 1966, however, the outlook was slightly less bleak. Changes within NATO itself diminished fears that Germany would secure a physical share in nuclear power. These changes were the virtual abandonment of the two plans which had been discussed for so long—MLF and ANF—plans for consultation through ministerial groups. (MLF was the proposal for a mixed manned force of surface vessels and the ANF the proposal for an Atlantic nuclear force.) Furthermore, it was argued, Germany would not wish to be thought of as a major obstacle to a non-proliferation treaty. But in the non-proliferation talks time was running out. It was only on the test-ban talks that time was on the right side, since with time more effective monitoring devices are being introduced.

The Nuclear Disarmament Talks: Geneva, 1967.—Talks were resumed about the spread of nuclear weapons at the 18-power Conference at Geneva in February, 1967, where it was expected that a Soviet-American draft treaty would become available for debate. The salient factors seemed to be: (1) Two countries—France and China—would not be interested in such a treaty; (2) By forgoing the right to develop nuclear weapons countries must be reassured against nuclear threats, whether neutrals like Israel and India, or allies like Germany and Japan; (3) More was being asked of non-nuclear powers than of nuclear powers. The nuclear powers must, therefore, themselves fulfil obligations like banning underground tests, and cutting off the production of missile material. The negotiations between the U.S.S.R. and U.S.A. about the anti-ballistic missiles (noted above) will be carefully watched; (4) The objection (urged especially by Germany) that the Treaty would give a right of inspection of non-nuclear powers alone and that this would give a substantial advantage in the development of civil reactors for power or export to the military nuclear powers. Germany feared that an industrial inspection rôle could be used to forbid civil nuclear programmes under the pretext that these increased Germany's progress towards nuclear arms. Voices in Germany went further: that nuclear weapons research is essential for civil progress. In reply it was urged that EURATOM and the IAEA (International Atomic Energy Agency) provide adequate sources of research and technological information. It is doubtful if Germany's resistance was based as much on technological considerations as on more complex political ones.

The Draft Treaty for Non-Proliferation 1967 Analysed.—A draft was tabled by the U.S. and U.S.S.R. before the 18-power Disarmament Committee at Geneva in August 1967. Apart from the preamble the Treaty was drafted to comprise eight Articles. Art. III was missing as the two super powers could not agree on a text on the controversial inspection issue. Leaving aside Arts. VI and VIII, which deal with technicalities like ratification, the substance of the remaining five Articles was:

> Art. I would forbid proliferation by nuclear weapons signatories to non-nuclear weapon powers.
>
> II would forbid non-nuclear weapons signatories from proliferating, either by reception or manufacture.
>
> IV is concerned with safeguarding and encouraging the peaceful application of nuclear energy.
>
> V provides for amendment, and for a review conference after five years.
>
> VII declares the treaty to be of unlimited duration and deals with the right of a signatory to withdraw.

The Draft Treaty Completed in 1968.—The United States and the Soviet Union were able to submit identical draft texts in January 1968, with a text of Art. III (omitted from the earlier draft) on the controversial inspection issue. On this issue the Soviet Union made important concessions. Russia had insisted that the International Atomic Energy Agency in Vienna should be responsible for inspection. But West Germany, backed by Italy, insisted that Euratom—the Common Market's peaceful nuclear energy alignment—should be given the job of checking up. The agreed compromise in the draft gives Euratom 18 months from the signing of the treaty to work out inspection and control arrangements with IAEA.

Final Concessions on the Nuclear Treaty.—By March 1968 a single text, sponsored by both Russia and the U.S.A. emerged, containing a number of additions to meet at least some of the demands that had been put forward by the non-nuclear Powers. This single text was sent to the UN General Assembly. One of the question marks among the signatures that mattered was India—the American-Soviet joint offer of guarantees did not appear to provide the cast-iron protection that India might like against China.

Nuclear Inspection.—A major provision intended to be incorporated in the draft treaty (Art. III) to prevent the spread of nuclear weapons was that all non-nuclear nations should agree to international inspection and safeguards over all their production of nuclear power for peaceful purposes. But the draft did not intend to require existing nuclear powers to permit similar international inspection. The U.S. eventually removed this discrimination, which had provoked such strong criticism, by agreeing to accept equal restrictions upon herself. A single reactor can, while generating electricity, produce enough plutonium to make dozens of bombs every year. Scores of these reactors are being built all over the world; and secret diversions of even a small part of the plutonium they create would soon give every nation power to destroy civilisation and possibly life on this planet. The Soviet Union had always resisted, as we have explained, any form of international inspection of its nuclear plants.

UN Warning on Nuclear Power.—There are now enough nuclear warheads in existence to "eliminate all mankind." This was the view of twelve international experts expressed in a report to the United Nations in October 1967. Security would not be ensured by the acquisition of further development of nuclear weapons. In fact greater tension and greater instability in the world was the highest probable consequence of a further increase in the number of nuclear weapon States or of existing nuclear arsenals. There is no active defence system in sight, they said, which would prevent all nuclear weapons from reaching their selected targets. (Both the Soviet Union and the United States were preparing anti-ballistic missile systems.) The cost of producing weapons is so great that only six states, besides the existing five nuclear powers, could consider building "a modest nuclear armament" without reallocating a major part of their resources from constructive activities. These were West Germany, India, Canada, Italy, Poland, and Sweden. And only these could find the resources to expend the £200 million needed to develop "a small, high quality" force of nuclear weapons. (Israel and Japan are countries which might be regarded as having advanced nuclear technologies; and other powers which might obtain a nuclear capacity with external assistance include Pakistan and the United Arab Republic.)

America Decides to Build an Anti-ballistic Missile (ABM) System.—In September 1967 the U.S. Secretary of Defence announced that America was to spend 5,000 million dollars on developing a limited or "thin" ABM system. Pressure came

from three sources: (1) the military, who urged invulnerability for U.S. offensive missile bases, (2) the "military–industrial complex," who have a vested interest in the defence programme, and (3) political pressure for protection of American cities and the threat that the missile gap might be an election issue. To the argument that you would not need an ABM system if you equipped your missiles with more penetration to defeat Russia's ABM system, the reply was made that Russia would develop more penetration aids too.

Bambi is the abbreviated name for the new ABM defence concept and is short for ballistic-missile-boost-intercept. It is based on a network of artificial satellites which would track offensive missiles during their launching phase and intercept and destroy them before the warheads and their decoys (if any) have separated. The U.S. had abandoned work on Bambi, because of high cost and relative unreliability. But, in 1967, technological progress in reliability caused them to reconsider the Bambi system. If the Russians thought on similar lines the two countries would be back at a familiar stage of confrontation, both having spent huge sums of money to reach a more expensive level of deadlock and neither power having gained in real security. The reader may wonder how an operative Bambi system can be deployed when the two countries are prohibited under the terms of the space treaty from placing weapons of mass destruction in space. The answer must be that they could conduct experiments without actually placing nuclear warheads in their orbiting satellites.

Nike -X.—This is the name of the system on which America's ABM will be based. There are two elements in Nike -X: (1) the long-range interceptor (Spartan), and (2) the short-range fast reacting anti-missile (Sprint). Spartan is guided by computer and Sprint uses short-range radar. Spartan intercepts above the earth's atmosphere and Sprint when missiles re-enter the atmosphere, at ranges up to 30 miles. Sprint (but not Spartan) necessitates shelter protection below.

Cost of ABM.—The estimated cost of a heavy ABM system directed against Russia is upwards of 50,000 million dollars (or nearly twice the total national income of India). There were political repercussions of a serious kind:

(1) the risk that this new phase of the arms race might destroy the existing Soviet–American agreement on a partial test ban treaty;

(2) that it might endanger the Soviet–American agreement on the demilitarisation of outer space if it were found that ABM could not be fully tested without a nuclear explosion in space;

(3) it would give non-nuclear powers further excuse for not signing a non-proliferation treaty and

(4) American's decision to enter the ballistic missile defence system was announced just before a meeting of NATO's Nuclear Planning Group and, as explained above, the Group was set up to provide a forum to discuss this very kind of thing this unfortunate timing brought an outspoken public disagreement from the British Foreign Secretary.

Europe and Defence Against Missiles.—If the two giants go in for defence against missiles what can poor Europe do? All the factors seem to work against them. Some feared that an American defence system would increase the possibility of a nuclear engagement in undefended Europe. A missile defence system would be ruinous financially in Europe where, in most countries, the trend is towards reducing defence budgets. It would be militarily impracticable because separate systems would be needed for medium and intermediate-range missiles, for missiles from submarines, from aircraft, and from tactical nuclear weapons coming from ranges up to several hundred miles away. The time to destroy weapons from Russia would be less than that available to the U.S. Politically, finally, there is no reason to believe that common control arrangements would be feasible. But all the same the U.S. did open discussions with NATO for ABM defences in Europe.

Outer Space for Peaceful Developments.—An international treaty to preserve outer space for peaceful purposes was completed in December 1966. It was described by President Johnson as "the most important arms control development since the limited test-ban treaty of 1963." Mr. Johnson first proposed such a treaty in May 1966 since when there had been extensive talks between the U.S. and Russia, the only two powers which are seriously involved in space research. The drafting of the treaty was prepared by the United Nations. It provides for rights of exploration in space for all countries; no claims of sovereignty over celestial bodies; no orbiting of weapons of mass destruction (already provided for in an earlier UN resolution); the preservation of space and all celestial bodies for peaceful purposes; and other procedures for peaceful co-operation among nations in space and in the exploration of space.

The Idea of a Space Bomb.—That Russia was developing a new nuclear weapon was the belief of Mr. McNamara in Nov. 1967 when he was still the U.S. Secretary of Defence. He called the possible weapon a fractional orbit bomb or, since everything must have a convenient label, the FOBS (free orbital bombardment system). The fractional orbital bomb is different from the orbital bomb, which had a high orbit, for it would follow a short orbital path within the atmosphere at a height of 100 miles or less. When it approached the target it would be thrust out of orbit and directed downwards. The warning time would be less than half that of an intercontinental ballistic missile. Asked how heavy a warhead the FOBS would carry, Mr McNamara said it could vary from one to three megatons (about the size of a *Polaris* missile).

Mr. McNamara thought such a weapon would involve insurmountable difficulties in the final part of its flight and need not be feared. Why then did Mr. McNamara publish his view of Russian intentions at that particular moment? Mr. McNamara surprised people by saying that the Soviet FOBS project would not violate the international agreement banning the putting of nuclear weapons in orbit round the earth, because the new weapons would presumably only make a partial orbit of the earth. But they would be capable of making several orbits of the earth before being directed on to target. It was believed by others that the Russians, by such a development, would violate at least the spirit, if not the substance, of the agreement.

American Nuclear Superiority.—In spite of the misgivings in the U.S. suggested above, an expert (Mr. Louis Heren) writing in *The Times* (7 November 1967), after the announcement of the possible Russian orbital bombardment system, recalled that at that time the Americans had "a crushing preponderance in nuclear destructive power of three or four to one." "I would suggest that this assumption of the sanctity of American nuclear superiority puts the Russians in a dilemma . . . they have good reason for trying to keep up with the American Joneses. It would be very nice if they were more forbearing, but they are human and Mr. McNamara is in no position to lecture them." Mr. McNamara's evidence of superiority was given to Congress early in 1967. He made some dramatic claims.

> "Even if the Soviets in 1972 were to assign their entire available missile force to attacks on our strategic forces . . . more than one half of the total forces programmed in 1966 for 1972 would still survive and remain effective. . . . Our strategic missiles alone could destroy the Soviet Union . . . even after absorbing a well co-ordinated surprise first attack. Indeed the detonation of even one-fifth of the total surviving weapons over Soviet cities would kill about 30 per cent of the total population (73 million people) and destroy about one-half of the industrial capacity."

The plain man may well wonder whether the arms race is not already out of control.

Nuclear Defence Affairs Committee.—This nuclear defence group was set up by fourteen members—excluding France—of the Atlantic Alliance. The new group includes West Germany as a permanent member and makes joint nuclear planning a permanent feature of the Alliance. The NDAC is open to all 14 members but Iceland and Luxembourg (which have no troops in NATO) and Norway (which does not permit nuclear weapons on her soil) were not represented when NDAC was first formed in December 1966. The committee of the remaining 11 was appointed with 4 permanent members—Britain, the U.S., West Germany, and Italy—and 3 seats rotating among the other seven, the first three being Turkey, Canada, and the Netherlands. The creation of the new group completes the work of the McNamara Committee set up to advise on nuclear planning arrangements. The U.S. took the view that the Soviet Union should in no way regard the new formula as involving a spread of nuclear weapons, since, from the Russian point of view, the risk that the West could start a nuclear war would be no greater than previously. The same fingers would be on the same triggers and it was clear that there must be an abandonment of any attempt to create a mixed-manned nuclear force under whatever name. There would be joint consultation and a measure of joint control but the weapons themselves would not be in German hands. But whether the Russians would regard themselves as reassured and, if so, to an extent to encourage steps towards a non-dissemination pact, remained to be seen. The NATO Defence Ministers had yet to work out how their new committee would secure swift consultation in a crisis—a very complex problem.

Doctors Against War.—Under the conditions of political stress in the two years which preceded the Second World War, many doctors felt that they might have a special function in helping to stave off the emergency, or failing this, to mitigate its traumatic consequences in the population. Stimulated by the correspondence between Freud and Einstein on the hopes of peace, psychiatrists met and discussed problems of normal and abnormal group behaviour. In 1957 several groups were established to impress the public—and especially politicians—that scientists and medical doctors might have views on the problem of war prevention by virtue of their technical knowledge. This aspect was underlined by forceful spokesmen such as Russell, Haddow, and Rotblat. One of these groups was the Medical Association for the Prevention of War. The function of this group is to explore the causes and pathology of the war disease, so that logical and practical ways of prevention can be developed.

The Medical Association for Prevention of War issues its proceedings twice annually and holds a summer conference and other meetings. Its president is Sir Alexander Haddow, its chairman Professor L. S. Penrose, and the Hon. Secretary is Dr. Martin Bax, 62 Hornsey Lane, N.6. The following passages are based upon publications by the Association. Before we pass to these we may recall that the study of conflict and aggression led to the famous series of Pugwash conferences on science and world affairs. Again the Institute of Biology held a symposium on the Natural History of Aggression in London in 1963 when an attempt was made to relate the contributions of a variety of disciplines to the problem of international aggression. A fairly clear picture emerged. Intra-species aggression is common in the animal world but under natural conditions this aggression is nearly always modified by devices such as ritualisation, appeasement gestures, and other actions which tend to avoid actual killing. However, caged animals or those confined by other pressures such as over-crowding, have been seen to destroy themselves utterly. Seen against the background of the animal kingdom overt fighting among men, which has led to about 60 million deaths since 1820 and which may seem "normal" to some people appears pathological. Two questions arise: Has man caged himself in an artificial environment analogous to that of captive animals? Will he use his intelligence and unique power of vision to prevent the world from becoming so overcrowded that only unhappiness, cruelty, and death can be the result?

Security Re-examined.—It became evident, about fifteen years ago, that no group on earth is defendable. No general or parliament can any longer assure his people or its country of safety from attack, no matter how heavily armed. Perhaps some retaliation can be promised, but not defence, for we are too proficient in killing. Dr. Brock Chisholm of Canada who was Director General of the World Health Organisation pleads that security as a problem has changed its character; we have relied upon the belief that the survival of our family or nation depends on their ability to defend themselves against attack and to attack other groups successfully. But, as he argues, no group is any longer defendable. He continues: "Many people still believe that, even though we are now able to kill everyone on earth, including ourselves, at least three, four or five times over, if we could first arrange to be able to kill everyone, including ourselves, say a dozen or twenty times over, in some way we should be more secure and not so frightened." Not surprisingly he calls this insanity. Although supranational controls offer the only hope of human survival we still regard acceptance of such controls as disloyal. Our failure to react to new circumstances leads to the view that man may well be now in much the same kind of situation the dinosaur was in shortly before it died out. The dinosaur did not have sufficient thinking ability to be able to arrange for its own survival. Man does have the capacity to think and react adequately if, but only if, he can free himself sufficiently from the controls of his traditions, all founded on old, not present, situations and experience. We have no important tradition of concern for the welfare of people outside our own areas of identification. From now on we shall survive as members of the human race or not at all.

Chemical and Biological Weapons.—The Medical Association for Prevention of War has reprinted evidence of the increasing development and stockpiling of chemical and biological weapons. The chemical weapons which they are primarily concerned with, all toxic or noxious to man, fall into six arbitrary categories. The first three groups are incapacitating but usually non-lethal; the remaining three categories are lethal. The first three groups are irritating agents, vesicant agents (mustard gas and lewisite) and psychochemicals. Psychochemicals, also known as hallucinogens, lead to mental derangements. The substance most frequently discussed is LSD-25. The second set of groups include nerve gases. Dr. Victor W. Sidel and Dr. Robert M. Goldwyn, writing in the New England *Journal of Medicine* (Jan. 1966), think that, of the chemical weapons, nerve gases are the newest, the most effective, and the most likely to be used. Being odourless and colourless they give no warning; they act rapidly and effectively in low concentrations. A few inhalations can kill in one or two minutes. At concentrations attainable under field conditions, even a single inhalation can kill.

Biological Warfare.—Theoretically a multitude of bacteria, viruses, fungi and toxins could be used. Biological agents are invisible, odourless, and tasteless, and since they usually produce no immediate physiological damage, early recognition is unlikely. They could overwhelm without damage to material things and civilian population could be the prime target. The effects, however, cannot be completely predicted. Epidemic disease or mortality might be caused on a scale not visualised by the attacker. Biological agents may make the human being not only a victim but also a propagator of the disease. Relatively inexpensive, they can easily be manufactured by countries with limited industrial potential. No general agreement to outlaw germ or gas warfare exists today. The Fifth Pugwash Conference in 1959 recommended that a general international agreement should be negotiated to prohibit the use of chemical-biological weapons. But there has been little further debate on this subject, particularly among doctors; yet no nation could develop this kind of warfare without doctors.

II. A CITIZEN'S GUIDE

This part explains the working of Central and Local Government and gives a summary of some recent changes in the machinery of government, parliamentary reform, and new regional planning organisations. It deals with the Commonwealth, the United Nations, and Western International Organisations. Among the contemporary topics discussed are changes in Africa, and the constitutional and political implications of the Common Market (the economic aspects being dealt with in Section G, Part III). At the end is a list of Ministers in Mr. Wilson's Second Labour Cabinet as reconstructed in April 1968; and a list of voluntary societies of particular interest to the citizen.

CENTRAL GOVERNMENT.

We devote most of our available space to recent changes in the structure of Government, but we recapitulate first a few basic facts. The skeleton of our democratic system, the way Government works (Parliament, the Civil Service, Local Government, the Judiciary) can be fairly simply described. Our constitution is not a written one so that we cannot refer to chapter and verse of an actual text. It is the actual working of the constitution that matters and this changes over the years in subtle, complex and often disguised ways. Thus the reader will find that books on this subject fall into two main groups. In the first are those which give the current outline or anatomy of Government. In the other group are a considerable number of books (all the way from Bagehot and Dicey) on how the constitution has evolved, what it needs to do, the dangers and efficacy of changes and so on. We thus have a whole range of treatises by jurists, historians, political scientists, and politicians analysing concepts, history, actual working of parts of the constitution, and comparisons with Government in other countries.

We are unique in having an unwritten constitution. Democracy is preserved by the ordinary law, by the political organisation of the people, by custom, and by rights which depend upon the capacity of the people to preserve them. The supreme law-making body is Parliament (a word which originally meant a talk). Parliament has grown from the original principle that in important matters such as making the laws the monarch ought not to act without counsel and consent, and it now consists of two Houses, the House of Lords, composed of lords spiritual and temporal, and the House of Commons representing the commoners. The principal share of parliamentary business is conducted in the Commons. Its business is divided into three branches: legislative, financial, and critical. The life of a Parliament is limited to five years, although, on the advice of the Prime Minister, the Queen may dissolve Parliament and issue a proclamation calling for election of a new Parliament. Parliament is adjourned from day to day while in session. At the end of the session it is prorogued. At the expiry of its life it is dissolved.

The Queen.—The Central Government is vested in the High Court of Parliament or The Queen in Parliament, consisting of the Queen and the two Houses. The Queen's tenure of the Crown holds for life (unless she abdicates), it is hereditary, and it is held by statutory right. The Queen is a constitutional monarch; she takes an oath at her Coronation to rule according to the laws and customs of the people. The Queen is the head of the Forces, which are governed by "Queen's Regulations." She is also head of the Executive, that is, all the work of the State is enacted in the name and under the authority of the Crown. Her assent is necessary before a Bill becomes an Act of Parliament. Member countries of the Commonwealth (except Malaysia, Lesotho, and the Republics) owe allegiance to the Queen and she is represented by a resident Governor-General.

The Parties.—The right of a minority to oppose is an essential of democracy, and this idea means that political parties are allowed to function. The party system implies a government party (which has the largest number of candidates) and an opposition known as Her Majesty's Opposition. The system emerged in the latter half of the seventeenth century as Parliament gained the right to be the law-making body.

The Executive.—The work of applying the law and securing obedience is called the excutive work of the Government. The Executive comprises five bodies; the Queen, the Privy Council, the Cabinet, the Government Departments or Departments of State and the Civil Service.

The Cabinet was originally a committee of the Privy Council. It consists of the principal Ministers of the Crown, and is responsible for deciding the policy of the Government on all matters affecting the country, whether on foreign or home affairs. It has also complete control of the Government Departments. It is thus the central link in the whole machine of government. The Cabinet is responsible for the individual actions of its members. This follows from the requirement that a Minister's policy must be in agreement with Cabinet policy. Thus the Government have a common policy and act as one man. This is the meaning of the phrase "Ministerial responsibility."

The Prime Minister.—The Office of Prime Minister, like the existence of the Cabinet, was not formally mentioned in law until recent times. He is the link between Cabinet and Queen. It is he who decides when to advise the Queen to dissolve Parliament. He is leader of the Government party in the House of Commons and gives a lead on policy. A recent writer has pointed out how the Constitution has, after long evolution, divided the functions of leadership and vested them in two personages—a Prime Minister who is temporary and removable by the will of the electorate, and the Queen, who, by contrast, embodies the principle of continuity.

Legislation.—The law of this country consists of common law, statute law, and equity. One may describe the common law as that based on custom and usage as declared and expounded by judges. Statute law is the law made by Parliament, enshrined in Acts of Parliament or statutes of the realm. Parliament is thus concerned with the making of statute law. The subdivisions of English law are given on D3.

How Laws are Made.—Any member of the House of Commons may present a Bill after giving formal notice, but the principal Bills are those introduced by the Government based upon its programme outlined in the Queen's Speech.

The Bill has to pass three Readings before it can become law. The First Reading is a formality. The House gets down to discussion at the Second Reading when general principles as distinct from details are discussed. If the principles are approved, the Bill passes its Second Reading. It is then referred for detailed examination either to a standing committee or to the whole House sitting in committee. All financial Bills, such as the Finance Bill, go to a committee of the whole House of Commons. After the committee stage comes the report stage when the House considers the Bill as reported to it by the committee and decides whether further changes should be made. The final stage is the Third Reading when the House considers the Bill as a whole and whether it should or should not become law. If passed, it is sent to the Lords, where it enters on the same

course. When Bills have passed through their various parliamentary stages they are sent to the Sovereign for Royal Assent.

The Lords cannot require the Commons to agree to amendments; nor can they delay a Bill indefinitely. They have no power in respect of Money Bills; and since the passing of the Parliament Act 1949 any other Public Bill which has been passed by the Commons in two successive sessions may be presented for Royal Assent without the consent of the Lords provided that a year has elapsed between the date of the Second Reading of the Bill in the Commons and the date on which it is finally passed in that House.

Bills may originate in either House, unless they deal with finance or representation when they are always introduced in the Commons. The procedure is basically the same. *See also* C30(2).

Money Functions of the Commons.—The second function of the Commons (and one of its earliest in history) is to provide the State with money. The Government cannot raise money by taxation (or in any other way) or spend money without the authority of Parliament; and this power of authority belongs exclusively to the Commons. The House can vote money only on the demand and on the responsibility of a minister of the Crown.

Critical Functions of the Commons.—Parliament itself does not govern. The Queen's ministers are responsible for government and parliamentary government means that Parliament ensures that those ministers represent and have the confidence of the party which possesses a majority in the House; and further, that it controls the action of ministers by questions and criticisms. Any member may propose a motion of condemnation of any member or department of the Government, and such a motion would become a vote of want of confidence if it were made by the Leader of the Opposition.

The House of Lords is the oldest second chamber in the world and the most hereditary in its character. The House of Lords has two sets of functions, legislative and judicial. It is a party to legislation within the limits imposed by the Parliament Acts of 1911 and 1949. These limits are based on the fundamental principle that the function of the Lords, which is a non-representative assembly, is not to thwart the will of the people, but to ensure that that will is precisely and reasonably interpreted. The Conservative Party retains an overwhelming majority in the Lords and their powers of delay can limit the effective term of the life of a Labour Government. The right to run a full term of office ought not to be the privilege of the party which commands a majority in the Lords. The reform of the Lords came to the fore again in 1968 and is dealt with on C31. The judicial functions of the House of Lords sprang from the fact that it is the highest Court of Appeal for the United Kingdom.

The Life Peerage Acts, 1958 and 1963.—The 1958 Act was the first attempt to fulfil the promise of reform contained in the preamble of the Parliament Act, 1911. The Act provided for the creation of life peers and the introduction of women into the Lords. The first list of life peers in July 1958 included four baronesses—the first women members of the House of Lords.

The Surrender of Peerage: the Wedgwood Benn Case.—In 1962 proposals for the renunciation of peerage were made by a Parliamentary Joint Committee on House of Lords reform. This Committee was set up after a series of events involving Mr. Anthony Wedgwood Benn, M.P., who declined to accept his seat in the House of Lords upon the death of his father, Viscount Stansgate, whose peerage he inherited but did not want. The Peerage Act, 1963, legalised renunciation, the time limit for renunciation of sitting peers expiring in July 1964. Thereafter the House of Lords became a voluntary body entirely made up of those who want to be there.

CHANGES IN THE MACHINERY OF GOVERNMENT.

The administrative changes introduced by the Wilson Government and the Parliamentary reforms contemplated are described in the following paragraphs.

1. The Cabinet.

The Strengthening of the Cabinet.—One of the major changes made by the Labour Government was the strengthening of the position of the Prime Minister and the Cabinet by giving the Cabinet a much stronger Secretariat. The primary object of this is to ensure that the Premier and Cabinet are briefed at every significant stage of a political objective. A number of other benefits flow from this earlier briefing of the Cabinet. It is easier by this means to ensure that there is co-ordination between departments, which does not always operate between strong departmental chiefs. Further, such strengthening of the Cabinet secretariat ensures that someone is looking all the time at government as a whole and that the Prime Minister is as well briefed, as he should be, as any of his colleagues, when a subject comes up for final decision for which the whole Cabinet is responsible.

In addition to the change in 1967 whereby Mr. Wilson temporarily took over direct responsibility for DEA, as described below, Mr. Wilson extended the power of the Cabinet in another way; by ensuring that most of the chairmen of inter-departmental committees of senior officials came from the Cabinet and not, as hitherto, from, for example, the Treasury or Foreign Office. Another step was to send in outside experts to assess efficiency in departments like the Post Office, British Rail, gas, and electrical industries.

In reconstructing his Government in April 1968 Mr. Wilson said that a new committee of the Cabinet would be formed, called the parliamentary committee, to co-ordinate work in Parliament and consider the broader political aspects of the Government's business. This non-departmental Cabinet, or inner Cabinet, would meet more often and regularly than the full Cabinet. It was expected to consist of the following members of the Cabinet: Mr. Wilson, Mr. Michael Stewart (Foreign Secretary), Mr. Roy Jenkins (Chancellor of the Exchequer), Lord Gardiner (Lord Chancellor), Mr. Richard Crossman (Lord President, in charge of Health and Social Security), Mrs. Barbara Castle (Employment and Productivity), Mr. Denis Healey (Defence) and Mr. Frederick Peart (Leader of the House of Commons).

The Need to Look Ahead.—Few of the members of the Cabinet can have time to give adequate attention to the whole of the Government's business, apart from the Prime Minister himself and the Lord President and perhaps a couple of others. The whole scope and complexity of the problems of Government have become increasingly greater. That is a change which needs a novel solution. But great as that change is there is a further new factor, the need to look ahead: the pattern of our life and institutions and of the world is changing so fast that we need ministers sufficiently free to visualise what things will be like one decade or two decades ahead and the character of the problems for which we need to prepare now. An important step in this direction was taken with the appointment in April 1968 of Mr. Richard Crossman as co-ordinator of home policy. In his new rôle he will help to prepare the ground for the social advance expected after the "two years' slog"—promised by the tough 1968 Budget and Incomes and Prices Bill—has brought success to the Government's economic policy. A list of Cabinet Ministers will be found on C55.

2. The Government Departments.

Changes in the Structure of Government.—Some of the changes in the departments of the civil service made by the Labour Government on taking office in 1964 had been fully anticipated, but some were a surprise. A change fully expected was the

appointment of a Minister for Economic Affairs, whose new office was designed, it was claimed, " to put new heart and drive into the economy." The new Ministry was responsible for framing and supervising the plan for economic development; for the general co-ordination of action to implement that plan; and for all the economic policy related to industrial expansion, allocation of physical resources and regional implications of the expansion programme. Another new ministry of great importance was that of Technology described below.

Division of Responsibility between the Department of Economic Affairs and the Treasury.—While the former is concerned with physical resources, the Chancellor of the Exchequer at the Treasury is concerned with financial questions. The Treasury retains the traditional functions of estimates, expenditure, accounting for Government expenditure, budgetary policy, taxation policy, and all aspects, including international ones, of monetary policy. The two Ministries work closely together: programmes for capital expenditure must be related to the industrial development plan. The relation of monetary policy to the rate of expansion links the two Departments. In the previous Conservative Government the Chancellor of the Exchequer presided over the National Economic Development Council; in the Labour Government the chair was taken by the Minister of Economic Affairs.

The Prime Minister and DEA.—In August 1967 Mr. Wilson temporarily took over direct responsibility for the DEA, appointing Mr. Peter Shore to run the day-to-day affairs. (Mr. Shore was given a place in the Cabinet.) This step was a revolutionary one with only one true precedent—Churchill's takeover of the Ministry of Defence during the Second World War. Mr. Wilson's step was an extension of the powers of the Cabinet in a field that mattered more than any other, the harnessing of the country's resources. It was claimed that this new Downing Street–DEA union would cure interdepartmental delays—the subject which mattered most was the interdepartmental one of co-ordinating industrial, economic, and fiscal policies. This special responsibility was given up by the Prime Minister in April 1968 but he retains the responsibility he has had from the beginning for co-ordination, not only of industrial matters but of economic matters generally.

The Direction of Incomes Policy and Productivity.—A further change in the scope of the DEA was made in April 1968, when direct responsibility for the incomes policy and its implementation was transferred to a Secretary of State for Employment and Productivity, at the head of a newly constructed Ministry of Labour. The DEA was thus shorn of its day-to-day executive function in administering the incomes policy and left to concentrate on long-term economic planning—its original objective.

Ministry of Technology.—By the absorption of the Ministry of Aviation in 1966, the Ministry of Technology (Mintech) has become the biggest State-directed complex of scientific and industrial power in Europe. It was already responsible for the Atomic Energy Authority; grants to the National Research Development Corporation and fifty industrial research associations; and ten civil research establishments. The acquisition of Aviation brought in (1) the purchase of aircraft and electronics; (2) research and development contracts with industry; and (3) seven research and development establishments.

The problems before the Minister (Mr. Anthony Wedgwood Benn) are not only technological but how to design an effectual partnership between academic science, industry, and Government. This is a totally new task. It requires the same order of boldness and skill as the Government needs in their attempt to link unions, industry, and public in the refashioning of the economy.

Defence.—The Secretary for Defence (Mr. Dennis Healey) announced in January 1967 the creation of a Minister of Defence for Administration and a Minister of Defence for Equipment. The individual Service Ministers were replaced by Under-Secretaries respectively for the Royal Navy, the Army, and the R.A.F. He did not foreshadow either the abolition of the Chiefs of Staff or of the three independent Services. The pattern is:

Secretary for Defence (with Chief Adviser on Defence Policy)

Min. of Defence, Administration with Chief Adviser (Personnel and Logistics)

Min. of Defence Equipment with Chief Adviser (Projects)

Under-Sec. Navy

Under-Sec. Army

Under-Sec. Air Force

The Economic Network is illustrated below:

Cabinet Office

The Cabinet

Prime Minister

Parliamentary Committee

Economic Adviser

Economic Policy Steering Committee

Dept. of Economic Affairs

Treasury

Board of Trade

Dept. of Employment and Productivity

Special Adviser

National Economic Development Council

Industrial Reorganisation Corporation

National Board of Prices and Incomes

Little Neddies

The Department of Education and Science.—To this Department have been added Ministers of State with special responsibility for higher education and science, for schools, and for the arts. Within the scope of the Department fall the "pure science" research bodies:

Medical Research Council (MRC)
Agricultural Research Council (ARC)
Natural Environment Research Council (NERC) (for geology, hydrology, and oceanography)
Science Research Council (SRC) (for astronomy space, university nuclear research, etc.).

A fundamental innovation was the creation of a Council of Scientific Policy (CSP) to advise the Minister on the financial priorities of science policy. It replaced the old Advisory Council on Scientific Policy; and the deletion of "Advisory" from its title denoted the basic change from an ineffective to an effective body, a change advocated by Professor P. M. S. Blackett.

The Ministry of Land and Natural Resources set up in 1964 was responsible for all town and country planning functions, for the Nature Conservancy, National Parks, Access to the Countryside, the Forestry Commission (shared with Secretary for Scotland), mineral rights, conservation of water and its availability for the community's need, the geological survey, the establishment of the Land Commission and for future policies relating to the community's land needs. Minerals under the North Sea remained the responsibility of the Ministry of Power. In 1966 the Ministry was absorbed into the Ministry of Housing and Local Government and its Minister became a Minister of State there.

Planning Land.—The Wilson Administration gave the planning of land to a number of Departments. Decisions on land purchase are made in the Department of Economic Affairs or in the physical planning division of the Ministry of Housing and Local Government (which has now absorbed the Ministry of Land and Natural Resources) or both jointly.

Merging of Health and Social Security.—In 1966 the Ministry of Pensions and National Insurance and the National Assistance Board were brought together in a Ministry of Social Security. A further step in the co-ordination of the social services was to be taken in 1968 with the merging of the Ministries of Health and Social Security under the overlordship of Mr. Richard Crossman.

National Health Service.—The system whereby hospitals, general practitioners, and public health services are subject to different authorities was the subject of a review ordered by the Ministry of Health in 1967. The case for reform was said to be overwhelming. This review will not affect the balance between public and private medicine. The idea of area health boards, which would control all the activities of the medical service within their boundaries, was put forward by the Porritt Committee in 1962. But it did not seem possible to visualize completely a possible solution until the report expected in 1968 of the Seebohm Committee (considering the future of local authority community services) had been considered; and the report of the Royal Commission on Local Government.

The End of the Colonial Era.—The Colonial Secretaryship vanished in January 1967 with the transfer of the Chancellor of the Duchy of Lancaster (who had also been Colonial Secretary) to the DEA and the full integration of the Colonial Office work into the Commonwealth Office. Thus the position was that the Colonial Office died on 1 August 1966, the Colonial Secretary ceased to exist in January 1967 but there were still colonies in existence with some seven million people.

Foreign Policy: Need for Co-ordination of Departments.—The present administration structure (whereby there are three departments where there should be one) was criticised as inadequate for pursuing a coherent foreign policy, with speedy initiative. The independence of the Commonwealth Office, it was said, critically hampered the execution of policy, for example, on Cyprus or Rhodesia where every step needs to be cleared with the Foreign Office; and the Ministry of Overseas Development operated in a vacuum without reference to any criterion of foreign policy. There should be three Ministers of State for these departments, it was suggested, under the overlordship of a Secretary of State for Foreign Affairs.

Scientific Research and Development.—Since January 1967 scientific research and development has been co-ordinated under the Central Advisory Council for Science and Technology, responsible to the Cabinet and working under Sir Solly Zuckerman. Its function is to advise the Government on the most effective national strategy for the use and development of our scientific and technological resources.

3. Parliamentary Reform.

The Reform of Parliament.—So far back as 1963 Mr. Crossman had written: "More time is wasted and more energy and talent frustrated in the British Parliament than in any other organisation of which I have any experience. Under the Attlee Government and in the first years of Opposition it was difficult to raise the faintest interest either in the National Executive at Transport House or at Westminster for reforms which were dismissed as purely academic. Since the 1959 Election the mood has changed. . . . Collectively as members of Parliament they resent both the rapid decline in its prestige and the process by which it is being stripped of any real rôle in the great decisions of State." In the following year Mr. Harold Wilson spoke out strongly on the need of House of Commons reform. His proposals included:

(*a*) relaxation of the parliamentary voting system to allow more "free votes" and to eliminate the rigid doctrine of each vote involving an issue of confidence; and

(*b*) development of all-party committees on the lines of the existing Estimates Committee and Public Accounts Committee, not only to make investigations but to draft more controversial legislation.

The whole subject was examined by the Select Committee on Procedure in the Session 1964/5. The aspect in their reports which attracted most attention was how the extension of the Committee system might be used to provide greater information for M.P.s and improve the efficiency of Parliament. In the following paragraphs we describe, first, the different kinds of Committees of the House which exist and then something of the debate in recent years about the extension of the specialist Committee, leading, as we record below, to the decision in 1966 to set up one specialist Committee on a Government Department's work—the testing of the water by the very cautious insertion of one toe.

Committees of the House.—Before dealing with the new proposals we classify the existing Committee system. Committees fall into four groups: (1) Standing Committees; (2) Select Committees; (3) Joint Committees; and (4) Private Bill Committees.

A Standing Committee is a miniature of the House itself and the function of these Committees is to take over Bills for their Committee stage and thus to save time which would be spent on them if they were taken on the floor of the House. A Select Committee is a body of special powers and privileges to which the House has delegated its authority in a special way, for example, the finding out of facts, the examination of witnesses, the sifting of evidence, and the drawing up of conclusions which are reported to the House. Apart from *ad hoc* Select Committees there are a number

of Sessional Select Committees which are almost permanent bodies (like the Committee of Public Accounts, the Estimates Committee, and the Committee of Privileges). Joint Committees consist of members of Lords and Commons. They are really a Select Committee of the Commons deliberating with a Select Committee of the Lords; and are used to save duplication of Committee work in each House, generally on uncontentious Bills. Private Bill Committees deal, as the name connotes, with the Committee stage of Private Bills.

Committees are, of course, portions of the House; but in addition to these true Committees there are "Committees of the whole House." Such Committees consider Bills at the Committee stage and at them members may speak more than once to the same question, a valuable concession when discussing details of legislation. Committees of the whole House also include the Committees on Supply and the Committees of Ways and Means. The former consider details of money to be spent on the Services, including the Civil Service; and the latter to discuss ways and means of raising the money to be thus spent.

The Extension of the Committee System.—There were widely different opinions as to how the Committee system could be extended. But the majority view was that: (1) a new Select Committee should be set up, as a development of the present Estimates Committee, to examine how the departments of state carry out their responsibilities and to consider their Estimates and Reports; (2) the new Committee should function through Sub-Committees specialising in the various spheres of governmental activity. Thus the question was whether there should be an extension of the Committee system so that M.P.s not in the Government might get greater information and control over Government Departments; or some other Committee system such as prevails in some other countries. At that time Mr. Michael Foot believed that the idea that a series of specialist committees should be established to examine or help formulate the general range of administration or policy was a delusion. He thought that concentration on this issue would block or postpone a whole series of more urgent reforms, the main purpose of reform being to restore the authority of the House of Commons Chamber itself. Spontaneity and flexibility should be instituted into its proceedings, debates should be held over a much wider range and at much shorter notice "than is possible under present arthritic processes." More Committees, he thought, were likely to nurture the miserable deception that more and more issues can profitably be "taken out of politics." In reply it was urged that more members would be able to take an active part in gathering and analysing information and discussing policy in a more effective way; and that this process would enhance rather than diminish the significance of debates in the Chamber itself. In a very readable and informed book called *Parliament and Mumbo and Jumbo* (Allen & Unwin) by Emrys Hughes, who has been a member of Parliament for over twenty years, the author describes how the case for a committee system of government was put by Lloyd George to the 1931 Committee on Procedure and he doubts if it has ever been more clearly and forcibly put.

The subject was also well discussed in the Penguin Special *What's Wrong with Parliament?* by Hill and Whichelow (1964). They pointed out that the new Nationalised Industries Committee has shown that a group of private members, by thorough study and clear presentation, can do much to illuminate matters of special complexity and closer scrutiny by the Committee has meant less party controversy. There are a number of unofficial committees set up by members of all Parties to follow particular subjects—examples being the Parliamentary and Scientific Committee, the Parliamentary Medical Committee, and the Space Research Committee.

The Principle Conceded of Specialist Committees on Departments.—In October 1966, Mr. Crossmann, in whom great hopes had been reposed, changed his mind about offering members a free vote on changes in parliamentary procedure. But both sides of the House did agree to the appointment of two new Select Committees: one to deal with science and technology, and the other to be a specialist committee examining the affairs of a particular department at a time. The first department chosen for study was the Ministry of Agriculture, Fisheries, and Food. Thus a new chapter of great significance to public life was unobtrusively opened.

The First Commons Specialist Committee Reports.—The original two specialist Committees were, as we have said, on science and technology and on agriculture. The first report came from the Agricultural Committee, which was the first Committee to be charged with watching over a Ministry. The Committee started by examining how far the Ministry had adequately studied the results of accepting the Common Market's agricultural policy. The Committee's report describes certain difficulties it encountered in gaining access to certain papers and in making a visit to the ministry's delegation in Brussels. The report provided the House of Commons with a wealth of information which could not have been obtained otherwise and some idea of the quality of advice being rendered to the Minister on the subject examined. In the words of Mr. John Mackintosh, M.P.: "the experience of this specialist committee suggests that properly used, they can help reassert political control of the Whitehall machine, improve the level of information available for M.P.s and perhaps in time draw into the House more men who would find service in the Commons rewarding occupaton."

The Voting Age. The Government was placed in a dilemma by the recommendations in February 1968 of the Speaker's Conference that the minimum voting age should be reduced to 20. This proposal, which came into consideration with other suggested changes in the electoral law by the Government, conflicted with official Labour Party policy that the voting age should be reduced to 18. The voting age did not come within the terms of reference of the Latey Committee which reported in 1967 (*see* D7(2)) but the Government decided in April to introduce legislation to implement its recommendations to reduce the age of majority to 18 in such matters as entering into a binding contract, giving a valid receipt, holding and disposing of property, making a will. Young people, it was decided, were old enough at 18 to marry but not yet to vote. That would have to wait for a new Representation of the People Act.

Reform of the Lords.—An undertaking to curtail the delaying powers of the Lords was included in the manifestos of the Labour Party both in 1964 and 1966. The Government's promise, which appeared in the Queen's Speech, when she opened Parliament on 31 October 1967, was "to reduce the powers of the House of Lords and to eliminate its present hereditary basis"; and this would be supported by measures to ensure that the Government of the day always has a working majority in the Upper House over all other political parties. No serious argument between the parties seemed likely on the underlying principle of abolition of the hereditary basis of the Lords. Out of 1,045 present members, 744 are lords because their fathers were, 121 are there because past Prime Ministers have made them hereditary peers and 26 are there because they are bishops in the Church of England. Their presence has nothing to do with democratic government. But while there would be general agreement that the herditary principle was indefensible, there would be differences of view upon how to abolish the principle, over what period to complete the process, how to select hereditary peers who are to continue to sit in the new Chamber, and the working of the system of appointing life peers. As regards reform of the powers of the Lords, criticism springs from two facts:

(1) the power of the Lords to reject Statutory Instruments, exercised regardless of the wishes of the Commons; and

(2) their power to delay legislation, which the Commons has approved, by wrecking amendments.

The result of the second power can be a delay of up to a year and a considerable waste of the Commons' time. One proposal might be that, if the Commons did not want to take up a Lords' amendment of the kind in question, it should lapse after a period of a few months.

Crisis with the Lords averted on Abortion Bill.—A constitutional quarrel with the Lords was averted at the last moment in October 1967 over the Private Bill introduced by Mr. David Steel, a Liberal M.P., and called the Abortion (No. 2) Bill. The rules governing annual parliamentary sessions mean that Bills (with a certain minor exception) which are rejected by the Lords after surviving all their stages in the Commons must be reintroduced in the following year. The Commons were due to consider the text of the Bill, as returned to them by the Lords, in the last week of the session at the end of October 1967. The Commons would have been unable to accept two amendments of principle made by the Lords—the "consultants" clause and the deletion of the "environmental" clause—and it seemed that all the Parliamentary time and effort spent on abortion law reform would be rendered null and void at the last moment. The crisis was suddenly resolved by the Lords' changing their minds at the last moment and reversing their previous decisions. The "consultants" clause (which had stipulated that one of the two doctors who must certify the need for abortion would have to be an NHS consultant) was deleted on second thoughts by the Lords. The "environmental" clause was re-introduced into the text by the Lords. This clause makes an abortion legal not only if the woman's own health is endangered but if her family would be harmed if she had another baby. *See also* D42.

The Talk about Coalitions.—Very understandably discussion arose at the time of devaluation in 1967 about whether our party system was the best way to produce good government; and suggestions were pretty freely given. Thus Lord Robens, Chairman of the National Coal Board, said we needed, to run the country, "a damned good chairman and managing director and a damned good board", something, presumably, like the Coal Board. Mr. Cecil King, of the *Daily Mirror*, said government had long needed a managerial skill and efficiency, something, presumably, like the Printing Corporation to which the *Mirror* belongs. Mr. Aubrey Jones, Chairman of the Prices and Incomes Board suggested a new breed of politician-cum-administrator to whom should be devolved responsibility in fields where party politics seemed to him to discourage national decisions. A group to whom responsibility for economic planning could be delegated would be a super Prices and Incomes Board. Added to this was a revival of the idea of a coalition, natural, perhaps, at a time of disillusion with both the main parties. Professor Max Beloff put the case for a coalition government in an article in *The Times*. One of his main points was that we desperately need a series of major structural changes in our society; and since such changes always incite opposition no party government will ever seriously embark on it. Professor Beloff thought there was a ready-made agenda for a coalition government:

(1) reform in the machinery of government, that is, reform in both Houses and in their relations with each other and also in the organisation of departments; he cited economic responsibilities, education, science, and technology as victims of unsatisfactory departmental structure;

(2) problems presented by the rise in Scottish and Welsh nationalism;

(3) reforms in local government;

(4) the decline in standards of public administration, including the need to devise better ways of handling the relation of citizen to state;

(5) the obsolescence of the trade union structure and the anarchy of labour relations;

(6) the taxation system;

(7) the recasting of the social services.

This wide task can be done, thought Professor Beloff, only by a government which is unconcerned with immediate fluctuations in voting strength and resting upon a wide spectrum of both public and parliamentary support. He believed that the only two governments in the last 50 years which have shown any capacity for breaking through the cake of custom were the coalition governments of Lloyd George and Churchill. But both these were wartime governments and a national spirit of determination called these coalitions into play rather than the form of government which created the determination. It was pointed out that the post-war Attlee Government was a very good example of a Government which systematically broke new ground. Coalitions are by nature temporary and party policies remain alive in them. At the time of writing the relations between parties in Germany's coalition government are very strained.

Criticism of the Idea of Coalition.—The case for a coalition government put forward by Professor Beloff was, naturally, criticised. Thus Professor G. C. Moodie of the University of York found it unconvincing for many reasons. Professor Moodie explained that the main explanation for existing coalition governments lies in the existence of a multi-party system which, at least in France and W. Germany, many post-war leaders have deplored and tried to consolidate. What, indeed, these countries strive for are strong single-party governments. An agenda suitable for a coalition government is one thing; but there is a world of difference between the predication of problems to be solved and finding solutions for them. It is upon policies that parties disagree. The key question is what would need to be the composition and backing of a coalition government able to unite behind radical politics and secure the support of a majority of the electors. If it is said that the country needs a strong government to push through radical structural changes and at the same time ignore "immediate fluctuations in voting strength" and "the desire for popularity" then, Professor Moodie points out, it must be, apart from a one-party system of government, an all-party system of government which faces neither a general election nor an organised opposition. Such a long-term coalition government does not fall sufficiently "short of a straight descent into authoritanianism" to be desirable.

The Commons "Watchdog" Arrives.—By the Parliamentary Commissioner Act of 1966 a functionary new to the British constitution arrived—a commissioner who resembled the Ombudsman who had been the pride of Sweden for a hundred years. His office was designed to protect the citizen from bureaucratic maladministration. The Government recognised that there was a deficiency in the present method of investigating by questions and by letters to Ministers. The system lacked the cutting edge of an impartial and searching investigation. The "Justice" Report ("Justice" is the British section of the International Commission of Jurists) had suggested that the requirement that complaints should go to the Commissioner only from a member of Parliament should operate for a five-year trial period; but the Government made this a permanent requirement. They did not wish to see this initiative passing at some future time to the press or the general public. "Justice" had further suggested that a Minister should be entitled to veto an investigation; but the Government decided that the Minister should have no such veto and that his own administrative acts could be included in the investigation. Another change from the recommendations of the Report was in regard to files and minutes. "Justice" suggested access to files but not to internal minutes, but the Govern-

ment decided that for a thorough investigation internal minutes must go in (but not Cabinet papers). Further, the new Act denies to Ministers the right to claim Crown privilege before the Courts with regard to documents before the Commissioner. The Commissioner could report the result of an investigation either to the individual member or possibly to a Select Committee. While the new Bill was going through the Commons a Liberal Peer introduced a Bill in the Lords to establish regional Ombudsmen to deal with complaints relating to local authorities, local government committees, and their officials; but the Bill was defeated, the Government leaving it to local authorities to work out their own remedies.

4. The Civil Service.

Ministers and Civil Servants.—The relationship between the political head of a Department and his senior officials is a subject hitherto insufficiently analysed. Ministers are often appointed because they have a special knowledge or interest in the office to which they go. But very often this is not so at all. It could scarcely be otherwise under our practice by which a Minister can be switched from Economic Affairs to the Foreign Office overnight or Overseas Aid to Transport. Both these are actual recent examples. They were not unusual; the practice is as old as ministerial government. The new minister, whether he knows nothing or much of his new duties, must assume instant responsibility. His advisers are steeped in the subject; they have known the subject inside out for many years and they cannot but have formed their own views. The Minister is dependent on them for the whole body of relevant facts. It is their duty to put all the facts to the Minister and for him to decide on policy. It sounds much more simple than it can possibly be. The civil servants are doubtless men of integrity and impartiality; they are devoted and loyal. But the actual situation must often be complex and subtle between a Minister who comes with a new broom of a changing policy and a group of officials who for years have been setting their compass on a different course. Every student of politics must have concluded by changes of attitude that Mr. X, so enthusiastic about a policy before his appointment, had yielded to the subtle pressure of his permanent staff; and on the other hand he can discern when a new Minister has clearly had the force of character to lead his civil servants and not be subservient to them. We have assumed in this note that Civil Servants are beyond reproach and that any difficulty between them and the Minister spring inevitably from the situation. But an increasing number of outside specialists have in recent years joined the regulars; and the irregulars can bring a fresh eye to the situation. Such a critic was Mr. Samuel Brittan, a former member of the Department of Economic Affairs who, writing in *Crossbow*, accused the Civil Service of two failings—lack of accurate information and inability to make its views known to Ministers. He backed his attack by citing the case of the July 1966 economic crisis, which, he says, had been looming on the horizon since the May budget. The fact that the Chancellor "could get away with so many complacent statements until after the crisis was already upon us, must reflect upon either the advice he received or the vigour with which it was pressed." Conventional civil servants, Mr. Brittan says, do not sufficiently push forward unpalatable points of view. The regulars, he wrote, were rapidly regaining the ground they lost in October 1964 but the "need for more irregulars to shake a few cobwebs inside the Treasury is as great as ever."

The Labour Party's Proposals for Reform of Civil Service.—These proposals were contained in a testimony given by the Party to the Fulton Committee. The testimony made proposals which would revolutionise the whole Government machine. There has been no Cabinet decision which could, of course, thereby change the recommendations into Government policy; the proposals have instead been put to the Committee which the Government set up to examine the problem of the Civil Service. But the importance of the proposals lies in the fact that they were endorsed by the National Executive Committee of the Labour Party and that the Committee contains eight Cabinet Ministers including the Prime Minister. (The principal members of the Cabinet also testified privately to the Fulton Committee.) The proposals dealt with:

(1) the relations between administrators and politicians;

(2) those between administrators and specialists; and

(3) relations between the Civil Service and the public.

On the first the complaint was made of the excessive secrecy and of the amount of information which, in some departments at least, is kept from the Minister. "An enormous amount of work goes on in a department," says the document, "which the Minister knows nothing of—some of it research work which produces important results which are never shown to the Minister . . . some of it planning work which may be deliberately concealed from him. . . . It is this secrecy which makes some Ministers tools of their departments a good deal of the time. . . . Inter-departmental committees are a particularly effective way of undermining the authority of Ministers." On the second head the document argues that the separation of administrator from the specialist is running against the whole trend of modern management. Most scientists produce their best work when they are still young; scientific creativity tends to dry up as middle age approaches; at this stage a scientific officer will probably be glad of the chance to move on to the management side of the service; and his scientific background will give him something special to offer as an administrator. This mobility should help to avoid the moribundity which sometimes afflicts research establishments twenty years or so after their initiation. Thus scientists, engineers, and other "professionals" should be groomed as potential administrators from the very early days in the Service. The complaint of secrecy reappears in the passage on the third aspect, the relations between the Civil Service and the public, which it is said "sometimes make it appear that the whole structure of British Government is designed to protect the policy-making functions of Government from public scrutiny." Further aspects of reform were:

(1) decentralisation of authority and the use of the American method of "bureaux";

(2) personnel management;

(3) a Departmental Political Brains Trust; and

(4) a graduate school of government on the French pattern.

Tribunals of Inquiry: Royal Commission Report.—The Royal Commission appointed to review the Tribunal of Inquiry (Evidence) Act 1921 reported in 1966. Among its recommendations was that neither the Attorney-General nor any other lawyer with political ties should take part in investigations by tribunals of inquiry. It recommends that the Act should be used with the greatest reluctance but it is essential to retain its exceptional inquisitorial powers where it is vital that the truth should be established in the public interest. No Government, the Report says, should again set up a tribunal of the type used in the Profumo case (where evidence was taken in secret and Lord Denning was "detective, inquisitor, advocate, and judge") to investigate any matter causing nation-wide public concern. A tribunal's powers to insist on disclosure of sources of information should be used only where the sources are of vital importance to the inquiry. Generally the proceedings should be conducted in public.

LEGISLATION.

The volume of legislation can be gauged from the fact that during 1967 alone nearly one hundred Public Acts were passed. A feature of the

Labour Government's legislation has been the number of consolidating Acts, *i.e.*, Acts which brought together in one document several enactments on a specific subject. Examples of this process were Acts on Dangerous Drugs, National Insurance (including Industrial Injuries) Family Allowances, Compulsory Purchase of Land, New Towns, Public Health (Insects and Pests), Rating, Forestry and Road Traffic.

Among other Acts were:—

Law Commission Act, 1965.—Set up the Law Commission to reform the law. *See* D5(2), D41(1).

Monopolies and Mergers Act, 1965.—Made further provision for the constitution and proceedings of the Monopolies Commission; for the matters dealt with by the Monopolies and Restrictive Practices (Inquiry and Control) Act 1948; and to prevent or remedy mischiefs that may result from mergers of businesses or similar transactions. *See* G15(2).

Commons Registration Act, 1965.—For registration of common land and of town and village greens; and amended law on rights of common.

Murder (Abolition of Death Penalty) Act, 1965.—Abolished capital punishment of persons convicted of murder and provided for punishment of persons so convicted. *See* D7(1).

Race Relations Act, 1965.—Prohibited discrimination on racial grounds in places of public resort; prevented the enforcement or imposition on racial grounds of restrictions on the transfer of tenancies; and penalised incitement to racial hatred. The Act constituted a Race Relations Board with local conciliation committees. *See* C41(2).

Rent Act, 1965.—Restored the right to retain possession of certain dwellings; made further provision on security of tenure rents, and premiums; and restricted evictions without due process of law. *See* D34.

Prices and Incomes Act, 1966.—Established a National Board for Prices and Incomes and authorised the bringing into force of provisions requiring notice of price increases, pay increases, and other matters, and for enforcing a temporary standstill in prices or charges or terms and conditions of employment; dealt with the recommendation made by the said Board to amend the Restrictive Practices Act 1956; and provided for a period lasting not more than twelve months, for restricting price increases and pay increases and for other matters connected with prices and in- *See* Section G, Part III.

Industrial Development Act, 1966.—Provided for grants towards expenditure on provision of new business assets.

The Land Commission Act, 1967 created the Land Commission which from 6 April 1967 had the power to acquire, manage, and dispose of land and to impose " a betterment levy " in respect of all land transactions. Its purpose is to ensure that the right land is available at the right time for the implementation of national, regional, and local plans; and that a substantial part of the development value created by the community returns to the community. Its purpose further is to reduce the cost of land needed for essential purposes. The Land Commission is enabled to buy land compulsorily when it is suitable for development, although it may not be needed at the moment for development. Thus the Act creates a land bank; and by halting speculation in land likely to be needed for building it attempts to reduce the cost of land for housing. No scales of development levy are established in the Act but the Minister quoted during the passage of the Bill a figure of 40 per cent rising to 45 or 50 per cent of the development value itself.

Criminal Justice Act, 1967. *See* D41 (1).

Criminal Law Act, 1967. *See* D42(1).

Parliamentary Commissioner Act, 1967.—Appointed Parliamentary Commissioner (ombudsman). *See* C32(2).

Iron and Steel Act, 1967.—Established the National Steel Corporation.

There were two important Acts of social reform:

Sexual Offences Act, 1967.—Amended law of England and Wales on homosexual acts. *See* D42(2).

Abortion Act, 1967.—Amended and clarified law relating to termination of pregnancy by registered practitioners. *See* D42(2).

A Private Member's Bill on Divorce Reform was before Parliament at the time of going to press.

GOVERNMENT and INDUSTRY.

Economic Planning.—The National Plan, the incomes policy, and the strengthened pound were the three lines of advance in the Labour Government's attempt to put Britain in a position to earn its living and pay its debts. The National Plan set out to expand output, exports, and earnings over the five years to 1970. Its success depended upon the Government's ability to create a national sense of purpose and it was hoped that this would be done through two channels—first by factory production committees and also by the work and advocacy of the Regional Councils.

Changes in NEDC.—Mr. Michael Stewart who became Minister of Economic Affairs in 1966 and, as such, the Chairman of the National Economic Development Council established a new concept for that body. He changed it to a policy-influencing body instead of simply a consultative or advisory organisation. This gave some encouragement to the Confederation of British Industry which had been critical of the Council's rôle. Mr. Stewart envisaged that taxation policy (within the limits imposed by Budget secrecy) would come within NEDC's field of operations. NEDC would also review the National Plan, knocked sideways by the July 1966 emergency measures, with the hope of a revised version of the Plan making its debut in 1968.

The National Board for Prices and Incomes had been set up by agreement between the Government, Management, and Unions in April 1965 and given the task of investigating and reporting on particular issues under the policy for Productivity, Prices, and Incomes. By the time the prices and incomes standstill was introduced on 20 July 1966 the Board had published eighteen reports; the Government then asked it to complement these with a General Report to cover the whole period. In this Report (Command Paper 3087, 1966) the Board drew lessons of wider significance from its experience of particular problems in individual industries. Thus the Board argued that the promotion of a faster rate of growth—which is the key factor—required complementary action by Management, Unions, and Government. The Report dealt with the economic background to the Prices and Incomes Policy; elaborated suggestions for raising productivity; sought to link pay increases with increased productivity; and aimed to restrain automatic price increases. On wage claims and price increases the Board essayed to bring in the influence of public opinion. Thus it urged that references of significant wage claims should be referred to the Board at an early stage, before attitudes become fixed and a new type of solution difficult to provide, and while it is still possible for public opinion, with the help of an objective statement of the problems, to influence the conduct of the parties. Similarly with price increases, where the Board was concerned with the problem of what share of the growing product of an industry should appropriately go to its employees and what share to its consumers (*i.e.*, the public again). The Board were led on to suggest the need to clarify the rôle and duties of

arbitration and other wage-determining bodies which have hitherto been under strong compulsion to pay primary regard to the interests of the contestants and therefore to ignore the implications of the settlement for others. In all of this the Government were seeking on behalf of the nation to promote a policy whereby wages, incomes, and prices were not determined by power alone. By the opening of 1968 the Board had published fifty reports.

The Pressure for Restrictive Legislation.—The TUC's voluntary incomes policy, laboriously developed over a period of more than three years, received a self-inflicted blow when in February 1968 the annual conference of executives of the 163 affiliated unions carried the general council's policy statement by 4,620,000 to 4,084,000—a margin so small as to make it unlikely that the voluntary incomes policy could be made effective. Those members of the Government who had been pressing for new restrictive legislation felt that their case had become overwhelming.

How will the Little Neddies Grow?—It was clear that under the National Plan it was intended to make the Economic Development Committees —or "Little Neddies"—a prime factor in the national economic life and administration, covering as they would most of our national industry and commerce. They are to keep the Plan under review, initiate efficiency, educate management, plan training and retraining of workers, and be concerned with investment programmes, incentives, increase of exports, and many other things. Three elements were held to give them a sporting chance of growing into sturdy Neddies: the independence of their chairmen, that they were born by agreement and not by imposition, and that the unions were involved with them. Thus we have triangular bodies (Government, Employers, and Unions) not just subsidiary to Government but acting as effective interlocking units of the interests involved. It was hoped that there would be two further liaisons: one, with consumers' representatives and, two, an extension of the Neddy to inform and inspire the wider circle of employers and workpeople in the industry concerned and on whom in the last resort the future depends.

A New Constitutional Position.—We have said that Neddies are not just subsidiary Governmental agencies but are intended to be dynamic bodies in which the constituent elements of our economic life work together. This brings us to a fundamental change in our political life which has been insufficiently noticed. It is that the relation between Government and Industry has entered a new and more permanently intimate phase. Step by step the need to manage the economy has meant advice, persuasion, and regulation by Government. With the institution of the National Economic Development Council, the spawning of little Neddies and their increasing importance in articulating the National Plan we have bodies where policy will be settled. Lord Bridges had said in 1963 that if the NEDC settled policy effectively "it would take a lot of power from Parliament." We thus meet a new constitutional situation.

The Marriage of Capitalism and Planning is thus leading to new political institutions and mechanisms in Britain as in other countries; to a new balance between public and private power; and to a possible devitalisation of Parliament. This new problem, which springs from the growth during the last fifteen years of a new form of modern capitalism, is studied in a book, *Modern Capitalism: the changing balance of public and private power* by Andrew Shonfield, published by Oxford University Press. In this the institutions of the new system are examined country by country. He sees France as the classic case where principles and practice have been worked out with precision. The French system is paternalistic: the premise is that bureaucrats there are so skilled that they can impose their wills upon industrialists and labour leaders. Superior knowledge, persuasion, and inducements are, it is said, driving the industrial machine ahead. (Whatever handicaps in the political field de Gaulle inherited from the Fourth Republic he had the benefit, at any rate, of the great improvement which had already been effected by the civil service in the industrial regeneration of France.) In Germany, a similar effect is obtained in a different way. Government appears to remain passive and to regard free enterprise as sacred but bureaucratic direction is given from a non-government quarter, the banks. Mr. Shonfield, turning to Britain, examines the dangers of the extra purposiveness of a professional bureaucracy seeking to create and sustain extra economic growth. He examines ways of easing the impact on the citizen—by changes in law and other forms of protection.

New Forms of Government Enterprise.—A revolutionary new Government agency (the Industrial Reorganisation Corporation) to act as a holding company for new forms of Government commercial and industrial enterprise was announced in 1966. Armed with massive sums of capital it was intended to have almost unlimited powers to buy up privately-owned enterprises, found new ones, and create the circumstances for big mergers between existing industrial institutions. This formed a dramatic new method of taking over—short of public ownership—firms which are falling down on their task, coupled with plans for new incentives to industry and special incentives to regions. The Government would thus be able to step into a lagging section of the economy. As a trial run for this new plan the Government set up a Government-cum-private agency for the Fairfield ship-yard. This new strategy was described as tycoonery for the benefit of the nation instead of private profit. All this would require high economic intelligence and superlative direction.

The Industrial Expansion Bill was designed, as we have said, to enable the government to provide financial assistance to companies (on a voluntary basis) and, where appropriate, to take a share of their equity in return. It would have saved the need to legislate separately in each case. The Bill was attacked by the Confederation of British Industry as "backdoor nationalisation".

Retraining.—Industrial retraining was launched on an extended basis at the end of 1966 by a number of measures, including a Government contribution of up to £2 million in 1967 to help employers to provide additional places in their own training centres for retraining adults for semi-skilled jobs. By the end of 1968 it was planned to raise the number of places in Government training centres from 6,400 to nearly 10,000. Government centres will then be capable of training or retraining 20,000 workers a year. Among the Government's measures were a move for new Government centres by the end of 1967 making ten centres in all; more intensive use of space in Government centres; and apprenticeship training classes in technical colleges. The new factor in the retraining campaign was the recognition that training facilities can be expanded quickly only by making use of the resources available within industry and the training establishments of the armed services. These arrangements were aimed mainly at training semi-skilled workers but the main shortages were among more advanced skills.

REGIONAL PLANNING AND ORGANISATION.

Regional Economic Planning was introduced by the Labour Government in 1964. There are eight economic planning regions in England, while Wales, Scotland, and Northern Ireland each have economic planning machinery. The eight English regions are the Northern, Yorkshire, and Humberside, the East Midlands, East Anglia, the South

East, the South West, the West Midlands, and the North West. In each English region and in Scotland and Wales there are two bodies, an Economic Planning Council and an Economic Planning Board. The Northern Ireland Government set up an Economic Council in December 1964 and there is continuing liaison with the U.K. Government.

The Planning Councils are advisory bodies of members, appointed as individuals with a wide range of knowledge and experience of their regions. They are not appointed as delegates or representatives of particular interests. The membership is drawn from local government, industry, and commerce, the trade unions and other spheres of activity in the regions with a contribution to make to regional planning. The Councils assist in the development of planning in their regions in the context of the National Plan, and with a view to making the best use of the regions' resources and also to advise on the implementation of regional policy. In addition they advise the Central Government on the regional implications of national economic policies. The Councils have no executive powers.

The Planning Boards.—Each regional Planning Board consists of senior civil servants from the main Government departments concerned with regional planning. In the English region the Chairmen are all senior officials of DEA. The functions of the Board are in co-operation with the Planning Councils to help formulate regional plans and to co-ordinate the work in the regions of the Government departments concerned with regional planning. The creation of the Boards does not affect the existing powers and responsibilities of Local Authorities or existing Ministerial responsibilities.

Regional Centres.—Efficient co-ordination is aided by housing the regional planning staff of most of the main Government departments in the same offices. At each regional office is a joint Secretariat serving both Planning Council and Board. The English regional offices are at:

Newcastle	Bristol
Leeds	Birmingham
Nottingham	Manchester

London (serving both S.E. and East Anglia)

The Welsh and Scottish offices are at Cardiff and Edinburgh.

Consultation with Local Authorities and Other Bodies.—In the preparation of draft studies for their regions, the Planning Councils and Boards consult as necessary with local authorities, industrial, commercial, and other interests.

Regional Research.—As a first step towards improving the range and availability of regional statistics, the Central Statistical Office prepared the first Abstract of Regional Studies (September 1965). To increase research on regional studies the National Institute of Economic and Social Research was commissioned in 1965 to carry out a major three-year research project on regional economic analysis.

The Imbalance Between Regions.—The need for regional economic policies spring from two main reasons: (1) to speed up economic development in those regions which have lagged behind the most prosperous regions, and thus to make full use of their labour and other resources; and (2) to help tackle the problems of places where the pressure on resources and services is high. (A major factor to take account of in national and regional planning is the expected substantial increase in population.) Balanced development will help the nation achieve not only a greater but allow a steadier rate of economic expansion than in the past. The Department of Economic Affairs is responsible for co-ordinating work on regional planning as well as for preparing the National Plan.

Development Districts and Development Areas.—In addition the Government has taken other important measures aimed to secure balanced development. In the areas where more jobs are needed these measures are the building of more factories in certain areas defined as the Development Districts; exemption of the Development Districts from most of the Government's financial restraints; the granting more readily of permission to build factories or large extensions. There have also been defined new, wide Development Areas where grants for the purchase of new plant and machinery are paid at double the national rate and where there are other forms of Government assistance (at present available only in narrower Development Districts). Within roughly 40 miles of the centre of London and in the built-up area in and around Birmingham, a strict limit on the development of offices has been introduced.

South-East Development.—The first long-term physical plan to be issued by an Economic Planning Council was that of the South-East (1967). It was a diagram for accommodating about four million extra people round London in the last two decades of the century. The report marked the end of the green belt and satellite town approach for coping with London's expansion. That idea, an excellent one, did not work out as expected. The overflow from London was greater even than expected; and towns and villages in the green belt could not be confined. The new plan might be called the star plan with big and little fingers stretching out from the centre. (The finger plan is borrowed from the example of Stockholm, Copenhagen, Paris, and other cities.) There would be four big fingers or major swathes of development stretching out across Hampshire, Bedfordshire, Essex, and Kent, and little fingers poking out to Berkshire, Hertfordshire, and Sussex. First, the big fingers or major swathes. These would be up to 20 miles wide and the bulk of the region's growth would be steered into these corridors; and it is through them that the motorways and main line railways will thread. They run towards (1) Luton and Northampton, (2) Chelmsford and Ipswich, (3) Southampton and Portsmouth, and (4) East Kent. Second: the little fingers poke out towards Hitchen, Southend, Newbury, and Brighton. Between the fingers there would be the country zones in which there would be special landscape features such as the Sussex Weald, the Downs, the Chilterns, and the North Essex farmland. These, it is said, would be carefully preserved. The Metropolitan Green Belt would also be preserved.

Declarations to preserve countryside of unusual beauty are to be welcomed; but they have often in the past been unequal to pressures against preservation. If this be regarded as unduly sceptical the sad fact must be recorded that the proposed Stansted airfield and all the development which would have clustered round it came smack in the middle of an area set aside in this plan for the most careful preservation.

Nationalism in Scotland.—This seems a good place to record the striking indications in Scotland and Wales of dissatisfaction with administrative devolution. A Scottish Nationalist captured the Hamilton parliamentary seat at the by-election in November 1967. It was not a touch and go affair but a resounding victory, for Mrs. Winifred Ewing the Scottish Nationalist candidate, changed a Labour majority of 16,576 into a majority for her of 1,799. Nationalism in Scotland had grown during five years to 60,000 members, 200,000 votes at May 1967 to give them a spread of local councillors, considerable funds, and then an M.P. And more than that, for after Hamilton, it was said that all Scotland's 71 seats were vulnerable. At Westminster Mrs. Ewing teamed with Mr. Gwynfor Evans, the Welsh Nationalist, in the first Nationalist force since Parnell's day. The Nationalists complained of economic problems, emigration, low wages, poor housing—problems

which never improve no matter who rules at Westminster. This complaint was hard to bear for a Government which had promised to redress the balance between poorer and richer regions and had made some progress in doing so. It looked as if two waves were combining to make what might prove a tidal one. The first wave, of disappointment with both parties—an attitude which was clearly growing throughout Britain in 1967—was mounting with the wave of disappointment at something lacking in the administrative practice of Government rule in Scotland. What was lacking was described by *The Guardian* as "the living breath of democracy."

Devolution or Autonomy.—That there should be devolution of function to Scotland and to Wales has been advocated for years, particularly by Liberals. But Liberals did not believe that Scottish or Welsh Parliaments should take over all the functions residing in the Parliament at Westminster. Nor that the British economy could easily be split into three independent units with greater benefit to each.

Nationalism in Wales.—Mr. Gwynfor Evans, mentioned in a preceding paragraph, had captured Carmarthen from Labour for Plaid Cymru in 1966. Following that there had been high polls for the Nationalists at Rhondda West and Pollock, in March 1967.

LOCAL GOVERNMENT.

Local Government is concerned with the domestic duties of a community as distinct from national questions like defence or taxes which must be decided by Central Government. England and Wales (exclusive of London) are divided into Administrative Counties, County Boroughs, Boroughs, Urban Districts, Rural Districts, and Parishes. The structure, as the chart shows, is split vertically: on the one side stand the county boroughs (all local government therein being in the hands of one authority—the county borough council): and on the other the organisation governing the administrative county (where there is a division of function). In Scotland there are County Councils, Burgh Councils, and District Councils; and in Northern Ireland there are County Councils, County Borough Councils, and Borough, Urban, and Rural District Councils.

Local Government in England and Wales

Parliament

1st Tier	County Councils (58)		County Borough Councils (82)		Greater London Council
2nd Tier	Non-County Borough Councils (276)	Urban District Councils (547)	Rural District Councils (473)	Corporation of the City of London	Metropolitan Borough Councils (32)
3rd Tier		Parish Councils		Parish Meetings	

London Government.—The London Government Act, 1963, involved the abolition of the London County Council and the Middlesex County Council, and parts of Essex, Surrey, Kent, and Hertfordshire have been incorporated in Greater London, which now covers the whole of the continuously developed area within the green belt. The system came fully into effect on 1 April 1965.

The London Boroughs.—There are 32 London boroughs and the population of each is between 70,000 and 340,000. Broadly speaking the new boroughs are responsible for all the important personal services such as housing, health, and welfare. Each council has a maximum of 60 directly elected councillors, plus aldermen up to one-sixth, making a maximum of 70. The councillors retire together every three years. The independent position of the City of London remains unchanged and it has the powers of a borough.

The Greater London Council, a directly elected body, carries out functions which need to be planned and administered over Greater London as a whole and consists of 100 councillors and 16 aldermen. The new Councils in Greater London came into existence as local authorities when they were elected—the GLC on 9 April 1964, and the London Borough Councils on 7 May 1964—and from then until 1 April 1965 the new authorities and the old continued side by side. On 1 April 1965 the new councils took over their full functions and the older authorities ceased to exist.

Elections for the Greater London Council.—For the first election of the Council, held on 9 April 1964, each of the 32 London Boroughs was also the electoral area and returned two, three, or four councillors, according to the size of the electorate in each area. These electoral arrangements may, however, be changed for future elections and it is possible that the number of electoral areas will be increased and will probably return one councillor only. Elections will be held every third year on a day which is fixed by the Home Secretary.

The Powers of Boroughs.—Each borough is a housing authority although the Greater London Authority is the "overspill" authority. Local development plans are drawn up by the boroughs (within the framework of the overall development plan of the GLC) and the boroughs are responsible for dealing with applications for planning permission. They are wholly responsible for a wide range of personal health services and welfare services for the elderly, the sick and the handicapped, and children's services. The GLC will complete the LCC housing programme and, for the time being, inherits the LCC stock of houses (about 230,000) and will eventually transfer them to the boroughs.

Education in Greater London.—In Inner London, virtually the ex-LCC area, education is the responsibility of a special committee of the Greater London Council, consisting of members of the GLC elected from the central area together with a representative of each London Borough Council, and of the City of London. The ILEA maintains the education service and decides the amount of money needed to be raised by precepts on Inner London Borough Councils and by borrowing. The education committee established by the ILEA consists of the members of the

Authority together with 16 other persons chosen from people experienced in education. The unique arrangements for Education in Inner London preserve the continuity of the service which has developed since 1870 as a unity without regard to local boundary divisions. In the Outer London Area education is the responsibility of the borough council. The Act required that a report reviewing these special arrangements for education in Inner London should be presented to Parliament by 1970, but on 18 November 1965 the Government announced its intention of introducing legislation making the arrangements permanent and dispensing with this requirement.

Highways and Traffic.—The GLC is the traffic authority for the whole of Greater London. Thus "metropolitan roads" come under the GLC and the new boroughs take the remaining roads except trunk roads which the Ministry of Transport continues to look after.

Other Functions.—The GLC is responsible for fire and ambulance services, for refuse disposal and main sewerage. It is responsible initially for LCC Parks and open spaces and places like the Royal Festival Hall, the Crystal Palace, the LCC museums, and Kenwood House. An intelligence department is being set up for the GLC charged with the duty of study and research into the many problems of Greater London.

The Local Government Act 1958 included the following provisions in regard to local government in England and Wales:—

1. Replacement by a general grant of a number of separate grants made for specific services. The largest to be absorbed are those for education, health, fire, and child care.

2. Rerating of industry from 25 per cent. of net annual value to 50 per cent.

3. Creation of two Commissions, one for England and one for Wales, to review the areas of counties and county boroughs, and to consider claims for extensions and also claims by large non-county boroughs or urban districts that they ought to be county boroughs. (A population of 100,000 will be regarded as establishing a presumption of adequate size.)

4. Selection of five big provincial conurbations (in England) for special review by the Commission.

5. Reviews of districts and parishes, outside these five areas, by county councils.

6. Delegation of certain health, welfare, and education functions by county councils to the larger district councils.

The Commission's Reports.—By the beginning of 1966 the Commission had issued nine final reports —West and East Midlands, the South West, Tyneside, the North East, West Yorkshire, York and North Midlands, Lincolnshire and East Anglia; and they had made draft reports on the North Western General Review area and South East Lancashire and Merseyside Special Review areas.

The End of the Local Government Commission.—It seemed in 1966 that this Commission had decided that there was little point in going on with their work in view of the radical re-thinking which was taking place. The Commission was formally wound up in 1967.

Two New Royal Commissions.—In 1966 the Government decided to be bold and appointed two Royal Commissions to review and to revise Local Government in England and in Scotland respectively. They were expected to take two years to produce a finished plan and not just a set of principles. A third year will be needed to debate legislation so that by 1970 there should be the new structure essential for a modern Britain. The Local Government Commission described above will be disbanded. The evidence which that Commission has gathered, together with the reports of the Maud and Mallaby Committees on the management and staffing of Local Government will provide an abundance of facts. It was expected that a reformed Local Government would reduce the demand for elective Regional Government. But one supreme thing was expected: that the result would be a root-and-branch reform.

THE COMMONWEALTH.

The Commonwealth is a free association of twenty-eight (1968) sovereign independent States. So vast and complex an association has not been easy to define with precision. For a long time the term "British Empire" was used, and the self-governing countries (other than the United Kingdom) were called "Dominions." These terms have now given place to "Commonwealth" or "Commonwealth of Nations" and "Members of the Commonwealth." The last term describes the sovereign countries named on K189. Other parts of the Commonwealth, such as Colonies, while they may be described as "Commonwealth countries" are not *Members* of the Commonwealth.

The Nature of the Commonwealth.—The Commonwealth is not a federation, for there is no central government, defence force, or judiciary, and there are no rigid obligations or commitments between them. Nor is it a contractual association as the United Nations is. Like the United Kingdom itself the Commonwealth of Nations has no written constitution. But all its members have a broad community of interests, and they are bound together by a common sense of ideals and by a common interest in the maintenance of peace, freedom, and security. Although the Commonwealth includes about a quarter of the total population of the world about three-quarters of the Commonwealth's people live in India. The white population of the Commonwealth is only a small fraction of the whole. The diversity is further illustrated in religion, for the Commonwealth includes over 200 million Hindus, 100 million Moslems, and 80 million Christians. The same variety appears in climate and natural resources. But in spite of diversities of race, religion, language, and tradition, members share a common political heritage which has given rise to a broadly common pattern of institutions.

The Sovereign and the Commonwealth.—The Queen's legislative power in the parliaments of the Commonwealth is a formality—she reigns, though she does not rule; but she provides the element of continuity in the administration. The Queen is, therefore, Queen of the United Kingdom, Canada, Australia, New Zealand, Ceylon, Jamaica, Trinidad and Tobago, Sierra Leone, Malta, Gambia, Guyana Barbados and Mauritius, all of whom owe her allegiance, and she is the symbol of their free association in the Commonwealth. Those countries which are Republics (India, Pakistan, Ghana, Cyprus, Nigeria, Tanzania, Zambia, Malawi, Botswana, Uganda, Singapore, and Kenya) with Presidents as Head of State; Malaysia, which has one of the Malay Rulers as Head of State; and Lesotho, which has its own monarch, do not owe allegiance to the Queen. All members accept her as the symbol of the free association of member nations of the Commonwealth and as such Head of the Commonwealth.

The Colonies.—As stated in the opening passage of this outline, the United Kingdom, in common with other members of the Commonwealth, has certain dependencies which are described as "The Colonies." But this is a loose term, for "the Colonies" are not really all Colonies in the strict sense. What are loosely spoken of as Colonies

are properly divided into Colonies, Protectorates, Protected States, Trust Territories etc.

Definitions.—*Colony.*—A territory belonging by settlement, conquest, or annexation to the British Crown.

Protectorate.—A territory not formally annexed, but in respect of which, by treaty, grant, usage, sufferance, and other lawful means Her Majesty has power and jurisdiction.

Protected State.—A territory under a ruler which enjoys Her Majesty's protection, over whose foreign affairs she exercises control, but in respect of whose internal affairs she does not exercise jurisdiction.

Trust Territory.—A territory administered by the United Kingdom Government under the trusteeship system of the United Nations.

Condominium.—A territory over which responsibility is shared by two administering powers.

Leased Territories.—This term applies only to that part of the mainland of China which was in 1898 leased to Great Britain for ninety-nine years and is administered by the Government of Hong Kong.

Associated State.—A former colonial territory which has entered into a free and voluntary association with Britain to become self-governing in all matters except for external affairs and defence. The term applies to six of the East Caribbean islands—Antigua, St. Kitts-Nevis-Anguilla, and the four Windward islands of Dominica, St. Lucia, St. Vincent, and Grenada.

Responsibility of the British Government.—The British Government is responsible for the affairs of Colonies (properly called Crown Colonies) both internal and external, and for their defence, and their peoples are British subjects. Protectorates are governed in the same way as Colonies, but have not been annexed. The peoples of Protectorates are not British subjects but British-protected persons. In the case of an Associated State the British Government is responsible for defence and external relations, though it may confer upon the Associated State's government authority to deal with specific matters of foreign affairs.

The Countries of the Commonwealth.—At the end of the Gazetteer is a list of all the countries of the Commonwealth showing their land area and recent estimates of population. The list distinguishes between the sovereign members and the British dependent territories, and classifies the latter according to the kind of dependency. Not all the British dependencies come exactly within the definition either of Colony of Protectorate, since, for historical reasons, many come partly under one heading, partly under another.

Mauritius and Nauru became independent in 1968. Nauru, the world's smallest independent state, was previously a UN trust territory, administered jointly by Australia, New Zealand, and the United Kingdom. At the time of writing constitutional details were still being worked out. The next countries which seemed, at the opening of 1968 to be coming up for independence were Fiji, Swaziland, and British Honduras.

Rebellion in Rhodesia.—The dissolution in December 1963 of the Federation of Rhodesia and Nyasaland led to the independence of Northern Rhodesia (as Zambia) and of Nyasaland (as Malawi) and left Southern Rhodesia, renamed Rhodesia, as a self-governing colony. Rhodesia's white, minority Government pressed for complete independence. The Rhodesian Front, under the Prime Ministership of both Mr. Winston Field and Mr. Ian Smith, had insisted that Rhodesia had an immediate right to independence based on (*a*) the fact that it has been self-governing for forty years, and (*b*) that this was morally, if not indeed explicitly but privately, promised by British Ministers when the Rhodesian Federation was broken up. The British Government, both under Conservative and Labour rule, specified only that while Rhodesia should move to independence like any other self-governing dependency, it should be under a constitution broadly acceptable to the people as a whole and should provide for a peaceful transition to majority rule. This principle was elaborated in a statement of five conditions set out in the following paragraph. It was not said by either party that independence could not be granted to Rhodesia until a government elected on a franchise wide enough to be described as a government "of the majority" is actually in power. But that majority rule must be the precondition was asserted by the two Rhodesian African leaders (divided, but both in prison), by the African States, by the United Nations, and by some Commonwealth countries.

Five Conditions for Independence of Rhodesia.—In the protracted negotiations between Mr. Smith and Mr. Wilson to reach a settlement in 1965 the latter took his stand on the following five conditions:—

1. a guarantee of unimpeded progress towards the majority rule already envisaged in the 1961 Constitution;
2. a guarantee of no retrogressive amendments of the 1961 Constitution;
3. an immediate improvement in the political status of the African population;
4. progress towards the elimination of racial discrimination; and
5. the overriding requirement that Britain must be satisfied that any proposed basis for independence would be acceptable to the Rhodesian population as a whole.

The British Government offered to co-operate in a crash programme of education for Africans to fit them to take an effective share in the economic and political life of the country within the span of, possibly, a decade.

The 1961 Constitution, which has been the subject of so much dispute, provided (for the first time) fifteen African members (in a Parliament of sixty-five) elected on a virtually all-African roll. The other fifty are elected on a common roll with residential and property qualifications, which were said to be low enough to enable enough Africans to become the voting majority in due course. But, even if this outcome were to be practicable, this period might be as high as twenty years. The African nationalists have largely boycotted registration on either roll; and the acceptance of the 1961 Constitution is tantamount to the indefinite continuance of minority—i.e., white—government.

Unilateral Declaration of Independence.—The long pressure for independence from 1963 to 1965 reached its climax on 11 November 1965, when Mr. Ian Smith declared the independence of Rhodesia; and the British Government were confronted by an act of rebellion. (U.D.I. became known as I.D.I., the illegal Declaration). The rebels protested their loyalty to the Sovereign, whose commands, however, they were repudiating. African opinion was outraged, and among the countries which broke off relations with Britain were two Commonwealth countries (Ghana and Tanzania), Mauritania, Guinea, Mali, the Sudan, Algeria, and the Congo (Brazzaville). Britain ruled out, from the start, the use of force; but Mr. Wilson embarked on a policy of graduated economic sanctions, including an oil embargo; the objective being the emergence, under economic hardship, of a liberal alternative to the Smith régime. The United Nations took the view that the 1961 constitution had broken down and that the decrees signed upon I.D.I. amounted to the destruction of all safeguards for the rule of law and

for human rights in the 1961 constitution and earlier legislation.

Repercussions of the Rebellion.—On the very day of the illegal declaration in Rhodesia the United Nations General Assembly in a resolution adopted by 107 votes to 2 (Portugal and South Africa), with one abstention (France), condemned the declaration. (France disapproved of the declaration and would not recognise the new government, but did not vote because, in their view, it was technically an internal British matter.) Next day the Security Council by ten votes to none (France again abstaining) condemned the declaration. On 20 November the Security Council (again by ten votes to none) called upon the British Government "to quell this rebellion of the racist minority." There are many aspects of the complex position in Rhodesia, and several interpretations can be given. But one central fact must be stated simply: four million Africans remain subordinate to 220,000 whites. The implications of the rebellion go far beyond Rhodesia. It has exacerbated the whole problem of race division in Africa. As such it has aroused strong feelings in black African countries and has strained the Commonwealth (on the multi-racial character of which Britain has set such store). The rebellion exacerbates in particular the threatening confrontation between black African countries and South Africa and Portugal.

Commonwealth Conference 1966 and Rhodesia.—At the Conference of September 1966 it was decided to give the Rhodesian Front régime a final chance of a negotiated settlement with Britain. If the offer were rejected Britain undertook to sponsor jointly mandatory sanctions at the UN, withdraw all previous proposals for a constitutional settlement, and not grant independence before majority rule is achieved. The final offers by Britain had to be accepted before a fixed date.

It was expected that there would be another Commonwealth Conference in the autumn of 1968.

It was agreed that the British Government would not recommend to Parliament any constitutional settlement which did not conform with six principles. These six principles were the five conditions for independence set out in an earlier paragraph together with a sixth, namely: no oppression of the majority by the minority or of the minority by the majority.

Smith Régime Declared Illegal.—The High Court of Rhodesia declared in September 1966 that the Smith Government was illegal and the 1965 "Independence" Constitution was not the lawful Constitution. At the same time they rejected the applications of 600 political detainees who sought their release on the grounds that the Government which detained them was illegal. The Court based this rejection on the ground that the Smith Government was the effective and *de facto* Government. To avoid a vacuum the court, it was declared, must give effect to such measures of the Government as could lawfully have been taken under the 1961 Constitution for the maintenance of law and order. Immediately after the judgment the Smith Government introduced permanent preventive detection. But the effect of the court's decision was to make laws which fall foul of the entrenched provisions of the 1961 constitution illegal and therefore challengeable in the courts. The 1965 Constitution proposed to remove the entrenched provisions regarding constitutional amendment; and the further constitutional amendments introduced by the Smith régime made further inroads into the provisions protecting the liberty of the subject and the rights of Africans to hold tribal lands.

The Ride on the "Tiger."—After secret "talks about talks" between officials during the summer of 1966 Mr. Wilson and Mr. Smith had talks on 2 December on board H.M.S. *Tiger* off Gibraltar and prepared a working document which the Rhodesian Cabinet rejected three days later; and on the 16th the UN Security Council voted on a British resolution for mandatory sanctions, including oil. Mr. Smith said that in his view Rhodesia had become a Republic, a statement which he later modified.

Rhodesia's New Proposals in 1967 Rejected.—Mr. Ian Smith was told in December 1967 that the conditions which he was then demanding for a settlement could not form the basis of discussions as they were "fundamentally incompatible" with the six principles (described above) as agreed by the British Parliament. One of the changes proposed by Mr. Smith was that all African members of the Senate should be chiefs (who are paid by the Rhodesian authorities). This would mean that African elected representatives would no longer have it in their power to block retrogressive amendment of the constitution. Another change asked for by Mr. Smith was the removal of the safeguard that amendments to the specially entrenched provisions in the Constitution should be subject to appeal to a Constitutional Commission, with a further right of appeal to the Judicial Committee of the Privy Council. Yet another of Mr. Smith's proposals affected improvement in the political status of the African population and would seriously delay progress towards majority rule.

Rhodesia's Constitutional Council Speaks Out.—The Council ruled as unconstitutional a proposed new law making anyone found in unlawful possession of arms of war liable to a mandatory death penalty. The Council also rejected as unconstitutional a Bill empowering municipalities to segregate along racial lines recreational facilities in such public places as parks, playing grounds, and swimming baths. Nevertheless the Smith Government retabled the Bill unamended and they became law in November 1967.

The Royal Prerogative Flouted.—The gulf between the illegal Smith régime and the British Government—and, indeed, the rest of the world—deepened tragically with the "Salisbury hangings" in March 1968. The Appeal Court in Rhodesia refused to allow three condemned Africans to appeal against the death sentence to the Privy Council, a right guaranteed under the 1961 Constitution. By this decision, the Chief Justice recognised, in effect, the validity of the Smith régime's post UDI constitution, which abolished that right. Nevertheless the Queen exercised her prerogative and granted a reprieve on grounds of mercy, in view of the inordinate delay in carrying out sentence—more than three years in the case of two of the men and more than two years in the third case. The Queen's act of clemency was flouted and the men hanged. Another 100 condemned prisoners faced a similar fate. Some were doubtless common law murderers. But many others were guerrillas. To the Africans therefore the hangings of those guerrillas would be seen as the execution of prisoners of war. There are three comments to add to this note written at the time of the hangings:

(1) The Rhodesian judiciary, which had tried to maintain some neutrality, was now seen to be taking a step towards joining the rebellion although the judiciary was clearly divided on the issue;

(2) despite this new challenge, the British Government declined to close the door to future negotiations with the Smith régime; and

(3) the Conservative Shadow Cabinet announced that, in their view, the Commonwealth Secretary had acted correctly in the constitutional advice he had given to the Queen.

The Commonwealth Secretariat was established in 1965. This new body acts as a central source of information and preparation, independent of Britain's Commonwealth Office. Thus the Commonwealth has its own staff with no ties to

any single member. There is likely to be, at least experimentally, a form of Commonwealth Assembly—an idea which originated with the British Government. It is to be hoped that meetings will not be confined to London, but that other capitals will be given an opportunity.

Arnold Smith, Canadian diplomatist, was appointed to the new post of Commonwealth Secretary General. The quality of paramount importance in a Secretary General of a family of 730 million is his ability to get along with people regardless of race. It was said that his indifference to the colour of skin was nothing theoretic—he just did not notice, a colour blindness of attitude. But of course his views on racial equality are strong. Just before becoming Secretary General of the Commonwealth he said: "The division of humanity between the white and other races, which coincides too closely for comfort with the division between the affluent industrialised peoples and the poor underdeveloped peoples, is, I think, the most difficult and potentially dangerous problem in the world." The Secretariat were no doubt concerned to examine ways in which the rest of the Commonwealth might help to heal the tragic war in Nigeria.

Britain's Special Representative in Africa.—A Special Representative dealing with Britain's relations with Kenya, Tanzania, Malawi, and Zambia was appointed in 1965. He was Mr. Malcolm MacDonald, then British High Commissioner in Kenya. He became a roving ambassador to Commonwealth countries in Eastern and Southern Africa. The British high commissioners in those countries continued their functions in the three capitals now concerned—Nairobi, Lilongwe, and Lusaka; and Mr. MacDonald's responsibilities are to co-ordinate major policy problems in which some or all of these four countries are involved. Uganda preferred not to enter the co-ordination arrangement for the present.

New Attitudes to the Commonwealth.—In the words of the Prime Ministers' Conference, which is its highest organ, the Commonwealth is a voluntary, multi-racial, association of sovereign states. In his informative study *Colonies into Commonwealth* (Blandford), Prof. W. D. McIntyre traces the change in British politics in recent years which may greatly affect the Commonwealth. During the last century the Conservatives were regarded traditionally as the imperial party; the upholders of colonial freedom were the Liberals, and later the Labour Party. It was a Labour government which gave independence to India, Pakistan, Burma, and Ceylon. In the 1960s came a transformation of attitudes. Macmillan trimmed his course to the "wind of change" and endeavoured to pull out of Africa as quickly as possible. He was to incur the severe misgivings of nearly all the Commonwealth premiers by trying to join the Common Market. Thus it was the Conservatives who were then set on joining Europe and Labour who stood for cherishing the Commonwealth, as dramatically declared by Gaitskell in his famous speech at Brighton at the Labour Party Conference of October 1962. Another indication came in April 1964 when the Establishment must have been astonished to read a now famous article in *The Times* by "A Conservative," in which he said, "The Commonwealth has really become a gigantic farce." Back again in power, Mr. Wilson proved a strong advocate of Commonwealth initiatives—a peace mission to Vietnam and to Rhodesia, both in 1965, although neither was destined to take effect. Perhaps the most important development was the creation of the Commonwealth Secretariat in 1965. The first Prime Ministers Conference outside Britain since 1932 was held at Lagos in 1966. Many other Commonwealth projects are now being constructed. "Great Britain has lost an Empire and has not yet found a rôle," said Dean Acheson in 1962. Great Britain is finding that rôle. In the words of Arnold Smith, the Secretary-General of the Secretariat, "We must nudge mankind towards more understanding and tolerance. We have to develop quickly the habits and insights of co-operation on a global basis. The Commonwealth gives us one of the promising instruments for this purpose."

The Commonwealth in 1968.—The Commonwealth Prime Ministers did not meet in 1967 and it was hoped that they would in 1968. The Commonwealth had discussed little else in depth than Rhodesia since 1965. Race relations will always be a Commonwealth concern, and the views need to be heard of Botswana, Lesotho, and Malawi developing new relations with the Republic of South Africa, and the views of newly independent Swaziland. There are other pressing problems of course: the future of sterling as a reserve currency; the closing of the Suez Canal costing Commonwealth countries a great deal (and costing Britain £200 million a year); the civil war in Nigeria; aid, especially to India; preferences in trade and so on. Both Canada and Australia had new Prime Ministers in 1968.

Immigration from the Commonwealth: the Government White Paper.—The Government's policy was set out in a White Paper (Command 2730) issued in August 1965. The principal features of the Government's policy were:

(1) A drastic reduction to 8,500 a year in the number of Commonwealth immigrants allowed to enter Britain (compared with the existing figure of about 20,800 a year). Of the 8,500 work vouchers to be issued annually, 1,000 would be allocated to Malta under a special arrangement for two years.

(2) New controls on entry of dependants (except wives and children).

(3) Powers to repatriate Commonwealth immigrants entering the country illegally.

(4) An obligation on immigrants to produce health certificates before admission and additional health checks on entry.

(5) A determined attack on housing shortage to prevent immigrant overcrowding, exploitation, and multi-occupation of dwellings.

(6) Measures to integrate immigrants into British life to eliminate possibility of a grade of second-class citizens.

(7) Formation of a National Committee for Commonwealth Immigrants which would take over the functions of the Advisory Council established in 1962.

It was announced that a committee, the Wilson Committee, would review the whole system of discretionary control over aliens and Commonwealth citizens alike. The Committee recommended an appeal system against immigration decisions.

The Race Relations Act, 1965 introduced a system of local conciliatory committees which inquires into complaints of racial discrimination and tries to settle difficulties without recourse to Court procedures. A PEP Report (April 1967) revealed substantial discrimination in employment, housing, and the provision of credit facilities and a second and more effective Race Relations Act is to be expected.

The Street Report on Racial Discrimination.—This report was issued by Political and Economic Planning (PEP) in November 1967 on behalf of the Race Relations Board and the National Committee for Commonwealth Immigrants (a body reconstituted under the Archbishop of Canterbury). It was the second report of its kind. The first PEP report was on the extent of racial discrimination in Britain and stressed that patterns of segregation would develop if action were not taken. The second report urged that legislation is one of the forms of action both necessary and practical. The Government were already committed to an extension of the Race Relations Act to which the other political parties agreed in principle.

The Need for Adequate Enforcement.—The extension to employment and housing of the coverage of the Race Relations Act was announced in 1967 as a declared objective of the Government. It was hoped, especially by those who had studied the American experience, that the law would be backed by adequate powers of enforcement and by adequate resources and staff. Mr. Louis Kushnick, lecturer in American Studies at Manchester University, said that, all too often, commissions in the States emphasised the conciliatory, educational, and persuasive aspects of the law at the expense of enforcement. It almost seemed as if conciliation had become an end in itself, rather than one, among many, means of eliminating discrimination. "A commission must make itself felt." It was hoped that the new legislation would cover credit and insurance. Perhaps the Race Relations Board would be given quasi-judicial powers. Immigrants were, in 1968, still only 2 per cent of the community compared with 11 per cent in the U.S.

The New Relations Bill contemplated for 1968 needed, therefore, to cover the real problems, to empower strong enforcement in the last resort, and to have the confidence of the coloured man. It was hoped the new law would cover not only housing, employment, places of public resort, and credit facilities. It was also hoped that the Race Relations Board would be given powers to follow up cases if the conciliation procedure failed. Authority it was hoped would be transferred from the Attorney-General's office to separate race relations tribunals, independent of the Race Relations Board but with full judicial powers and staffed by specialists. The powers of such tribunals, it was urged, should include the power to award damages.

CARD form the initials of the Campaign Against Racial Discrimination, which has helped to persuade the Government to introduce legislation against dcrimination and to persuade the Wilson Committee to recommend an appeals system against immigration decisions. CARD was formed in Britain in 1964 after a visit here by Dr. Martin Luther King. It was unfortunate that in 1967 the black racialists sought to take CARD over at the centre. CARD's new need was seen to be better local organisation, as at Islington and Southall; to prod local authorities and employers into action; to tackle specific exploitation by certain landlords; and to improve relations between the police and coloured people.

A New Group for Stronger Laws: "Equal Rights".—A new group emerged in 1968 to lobby for stronger laws on race relations and sponsored by a panel of immigrant leaders and others. Its West Indian president is Professor Ray Marshall, Professor of Law at Sheffield University and other sponsors include Professor Sir Peter Medawar, Mr. Humphry Berkeley, Lord Brockway, Dr. David Stafford-Clark, and others, including Mr. Jack Jones of the Transport and General Workers Union. The group said it was not asking for special or privileged treatment for any section or individuals. "It simply asks for equal treatment." The group was designed exclusively as a lobby for the Race Relations Bill and contemplated that it would disband when effective legislation is passed.

The Joint Council for the Welfare of Immigrants.—This was another new body formed in 1967 which concentrated its first efforts at the point of immigration.

The Commonwealth Immigrants Act, 1968, which came into force on 1 March 1968, was passed to prevent the uncontrolled entry of Asians from Kenya, notwithstanding that they possessed British passports. The Asians had been given British citizenship as a part of the political settlement whereby Kenya had achieved independence in 1963. Mr. Duncan Sandys, who was Commonwealth and Colonial Secretary in the Conservative Government when Kenya's independence was being negotiated in 1963, explained that Asians living there had been allowed to retain their previous status as "citizens of the United Kingdom and Colonies" to save them from becoming stateless. Opposition to the Bill cut right across the two main parties.

Members of the Commonwealth in Britain.—The total number of members of the Commonwealth in Britain at the present date is about one million. Of these half are from the West Indies and 300,000 from India and Pakistan. There had been settlements in seaports for several generations; but an influx occurred in the second world war to supply ground staff for the Forces. Many of these stayed on and further numbers were recruited in subsequent years for special jobs, thus providing valuable streams of labour when labour was short. Immigrants have therefore settled in industrial areas, where pressures on housing and social services are heaviest. (The Holland Milner Report stressed that there was a housing problem before immigrants arrived.) Differences of language, cultures, and colour present obstacles to assimilation. Many of the immigrants, moreover, have come from the rural areas of their own countries, with little education and with poor or no English; and these facts, again, by keeping the groups tightly together make assimilation even more difficult. Although the tension appears to have been taken out of the situation in Britain the practical problem remains as to how to create a multiracial society. This is a responsibility not only of Government but of every element in society. It is said that the legislative action exemplified by the Race Relations Act has not been sufficiently strong. But it is doubtful whether public responsibility has yet risen to the challenge. With some notable exceptions, such as at Leeds, York, and Reading, there has not been great initiative at the Universities; and the Trade Union movement has not yet used its influence and power towards solving the problems as we must hope it will. Nor have overseas students themselves been notably conspicuous by their interest. At the time of writing there are about sixty local conciliation committees under the National Committee for Immigrants tackling the day-to-day difficulties. Slowly the reluctance of people to become involved in problems with such novel and unknown factors may change to positive and informed action. We shall in the future be sorry if we do not now, while tension is relaxed, take a hand in creating stable relations. If we were to be successful, our example would have a great effect in a world where, in so many areas, the conflict of race is acute and dangerous. And we may thus help in easing the greater confrontation—the gravest of all—between the have and have-not countries.

THE UNITED NATIONS.

Charter of the United Nations.—The Charter of the United Nations was signed on June 26, 1945. The purposes of the United Nations can be divided into four groups (security, justice, welfare, and human rights) and the nations undertook to carry out four main duties (to settle disputes peacefully, to refrain from treating or using force, to assist in carrying out the Charter, and not to assist an aggressor). The UN affirms faith in the human rights of all without distinction of race, language, sex, or religion.

Membership of the United Nations.—The UN had one hundred and twenty-three member countries in 1968. They were:

Afghanistan	Brazil
Albania	Bulgaria
Algeria	Burma
Argentina	Burundi
Australia	Byelorussian S.S.R.
Austria	Cambodia
Barbados	Cameroun
Belgium	Canada
Bolivia	Central African Republic
Botswana	

Ceylon
Chad
Chile
China (Taiwan)
Colombia
Congo (cap. Brazzaville)
Congo (cap. Kinshasa)
Costa Rica
Cuba
Cyprus
Czechoslovakia
Dahomey
Denmark
Dominican Republic
Ecuador
El Salvador
Ethiopia
Finland
France
Gabon
Gambia
Ghana
Greece
Guatemala
Guinea
Guyana
Haiti
Honduras
Hungary
Iceland
India
Indonesia
Iran
Iraq
Ireland
Israel
Italy
Ivory Coast
Jamaica
Japan
Jordan
Kenya
Kuwait
Laos
Lebanon
Lesotho
Liberia
Libya
Luxembourg
Malagasy Republic
Malta
Malawi
Malaysia
Maldive Islands
Mali
Mauritania
Mexico
Mongolia
Morocco
Nepal
Netherlands
New Zealand
Nicaragua
Niger
Nigeria
Norway
Pakistan
Panama
Paraguay
Peru
Philippines
Poland
Portugal
Roumania
Rwanda
Saudi Arabia
Senegal
Sierra Leone
Singapore
Somalia
South Africa
Spain
Sudan
Sweden
Syria
Tanzania
Thailand
Togo
Trinidad and Tobago
Tunisia
Turkey
Uganda
Ukrainian S.S.R.
United Arab Republic
U.S.S.R.
United Kingdom
United States
Uruguay
Venezuela
Voltaic Republic
Yemen
Yemen, Southern
Yugoslavia
Zambia

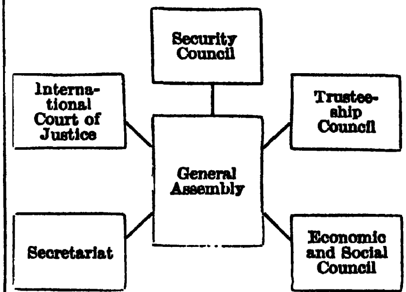
Botswana was formerly Bechuanaland, Lesotho was Basutoland, Guyana was British Guiana, and Southern Yemen was the Prot. of Southern Arabia (Aden). Thus there are now two Yemens like two Congos.

The membership includes 26 members of Commonwealth countries, representing one quarter of the world's population. The African group is numerically the strongest, with a membership of 38 (excluding S. Africa). Twelve member states are communist.

Major Organs of the United Nations.—The UN have six major organs: (1) a General Assembly, (2) a Security Council, (3) an Economic and Social Council, (4) a Trusteeship Council, (5) an International Court of Justice, and (6) a Secretariat. It is especially the inclusion of the third body on this list (with all the Commissions and specialised agencies which stem from it) which makes the UN more broad and balanced than the League of Nations.

General Assembly.—The General Assembly occupies a central position in the structure of the UN. But its business is quite distinct from the Security Council. It meets once a year. The Assembly can consider the general principles of co-operation for peace and security and disarmament and regulation of armaments. It can discuss any question concerning peace and security brought before it. It makes recommendations, but any question upon which action is necessary must be referred to the Security Council. The carrying out of its humanitarian work is the function of the new Economic and Social Council (dealt with below) which it elects and supervises. Further, the Assembly controls the purse

Principal Organs of the United Nations.



The Security Council.—The aims of the UN are wide—from feeding starving peoples to encouraging self-government in backward areas—but it cannot advance towards the noble objectives set out in the Preambles unless peace is maintained. The principal organ to preserve peace and security is the Security Council. The size of the Security Council was enlarged from 11 to 15 with effect from January 1966. Five seats are permanently occupied by Great Britain, the U.S.A., the U.S.S.R., China, and France. The China which is represented in the UN and on the Security Council is not, however, the Republic of China (or Communist China). It is the régime of Chiang-kai-Shek, who occupies Formosa. The other seats are normally elected for two years by the General Assembly. The ten temporary members are: Brazil, Canada, Denmark, Ethiopa, and India (expiring at the end of 1968), and Paraguay, Hungary, Pakistan, Senegal, and Algeria (retiring at the end of 1969). The Security Council sits continuously. It has two functions: (1) to promote the peaceful settlement of disputes and (2) to stop aggression. Under the Charter, parties to a dispute have already promised not to use force, to settle their quarrels peaceably, and to refer their dispute to the Security Council if they really cannot reach a peaceful settlement. On its side the Council can call on the parties to settle disputes peacefully, it can investigate any situation likely to cause a breach of the peace, and at any stage it can recommend a solution.

The Veto.—At this point we must deal with the veto, which applies to substantive questions. The number of affirmative votes required for adopting decisions on substantive matters is 9, including the votes of the five permanent members. In other words if any one of the permanent members says "No" to the use of force, even after a full investigation, the Council cannot use force to settle the dispute. Thus when it comes to imposing sanctions for a breach of the peace the assent is required of the Great Powers, and one of them may of course be a party to the dispute. If the Great Powers imposed sanctions on each other it would mean a major war in which the present UN would disappear. Partly in order to overcome the difficulty of the veto the Assembly set up a Committee to remain in permanent session consisting of one representative of each member. It is known as the Little Assembly, its formal title being the Interim Committee.

The Uniting for Peace Resolution, 1950.—The General Assembly had always been able to discuss matters of peace and security, although it could not make recommendations about them if they were being considered by the Security Council. But in 1950, after the Korean crisis, a new decision was taken by the General Assembly whereby if there were some threat or breach of the

peace on which the Security Council was in deadlock, the Assembly, on a vote of seven members of the Security Council, could consider it immediately and make a recommendation about it. This decision, to which Russia and four other countries were opposed, was called the "Uniting for Peace" resolution. By this resolution, too, the Assembly can be called together within twenty-four hours. It was the standing Interim Assembly which considered the Israeli–Egyptian dispute in November 1956.

The Economic and Social Council.—The UN pledged themselves to a broad humanitarian policy of which the following are salient points: to promote higher standards of living; full employment; the conditions of economic and social progress; solutions of international economic, social, health, and other related problems; educational co-operation; universal respect for human rights; and the fundamental freedoms for all. The main business of the Economic and Social Council is to carry out this broad policy. The size of the Council was increased from 18 to 27 with effect from January 1966. To tackle these huge problems the Council established a number of important commissions and bodies, the principal being the following:—

Regional Economic Commissions

Economic Commission for Europe (ECE)

Economic Commission for Asia and the Far East (ECAFE)

Economic Commission for Latin America (ECLA)

Economic Commission for Africa (ECA)

Functional Commissions

Disarmament
Statistics
Population
Social
Human Rights
Status of Women
Narcotic Drugs

Special Bodies

UN Children's Fund (UNICEF)

Commissioner for Refugees

Conference on Trade and Development (UNCTAD)

Industrial Development Organisation (UNIDO)

Intergovernment Agencies (previously called Specialised Agencies).—The agencies are organisations established by intergovernmental agreements, and their activities as a rule are co-ordinated by the Economic and Social Council. The list of the thirteen Agencies are given below.

International Atomic Energy Agency (IAEA)

International Labour Organisation (ILO)

Food and Agriculture Organisation (FAO)

UN Educational, Scientific and Cultural Organisation (UNESCO)

World Health Organisation (WHO)

World Bank (Bank)

International Finance Corporation (IFC)

International Monetary Fund (IMF)

International Civil Aviation Organisation (ICAO)

Universal Postal Union (UPU)

International Telecommunication Union (ITU)

World Meteorological Organisation (WMO)

Inter-Governmental Maritime Consultative Committee (IMCO)

General Agreement on Tariffs and Trade (GATT)

Several of these organisations were at work before the UN was set up. One such body is the ILO.

The FAO was heavily criticised in 1967 for the state of affairs at the Rome H.Q. of the organisation in a report of a committee of five experts set up by UNO.

A Peace Force.—In the twenty-three years since its inception the UN has been called on only four times for military action—in Korea (1950), in Egypt (1956), in the Congo (1960) and in Cyprus (1964). Korea was really an American "containment" action under the covering of the UN. In the other operations, the number of troops ranged from 6,000 to 20,000. Apart from military action, the UN has sent observers or "presences" to various parts of the world, mainly to the Middle and Far East, to facilitate settlement of disputes. Thus to maintain a standby force of 20,000 men, when it might be needed so rarely, would be a waste, apart from problems of bases, control, and equipment. Two ideas about the best kind of peace force hold the field. They are:—

(1) the earmarking of national military units; and

(2) a permanent multiracial force.

The cogent arguments for a permanent UN Military Force can be studied in *United Nations Forces* by D. W. Bowett, pub. by Stevens in 1967.

The Dispute over Dues.—Under Article 19 of the Charter the voting rights of any nation more than two years in arrears with its dues can be challenged. When the 19th General Assembly of the United Nations opened on 1 December 1964—and the meeting had been postponed in the hope that the quarrel over dues would be reached in the interval—Russia was two years in debt, not over its general dues, but because of its refusal to pay anything towards the special fund for UN military operations in the Congo and Middle East. France was in a similar position on 1 January 1965. There was, of course, a special political background to the dispute. By the Charter the Security Council is the executive body and it is in that Council that the Great Powers, including Russia, can exercise a veto. But in 1950, at a time when Russia was boycotting the Council, the United Nations were able to take action in Korea; and then, realising that a veto in the council could prevent future peacekeeping operations, the Assembly took upon itself special powers to act where the council had failed. The Russians asserted that this was illegal and refused to contribute to the special fund for the UN forces at Gaza (put there after Suez) or in the Congo (now withdrawn).

The essence of the dispute was not a financial one but a constitutional political one. It involved the whole function and power of the Security Council and the General Assembly and the relative functions of the two. The Russians maintained that all peacekeeping should be controlled by the Security Council where the veto existed. But the rest of the membership of the UN maintained that the General Assembly had the right and duty to intervene where the Security Council had failed to act, whether owing to the veto or otherwise.

A United Nations Success: Technical Assistance.—That the United Nations is something more than a place of talk is proved by a glance at the history of its programme of Technical Assistance. Those who like figures will enjoy being told that 32,000 expert years have been spent by 13,000 men and women of 90 different nationalities during the fifteen years of help in developing countries. So far 456 million dollars have been contributed and 150 countries and territories have benefited. Asia and the Far East have received 32.6 per cent of the projects, Europe 6·3 per cent, Latin America 24·1 per cent, the Middle East 13·6 per cent, and Africa 20·3 per cent. In the Congo technical assistance continued throughout the disturbances. The object of this aid is to help countries to develop their economic and political independence; and, since this must be a truly co-operative venture, receiving countries must not only invite the experts

but actively participate in projects they undertake both with money and with local personnel—even the poorest being encouraged to make a contribution.

Simplification of Aid Programmes.—A major reform was made in 1966 by the simplification of the existing systems of capital and technical aid by the United Nations. The two main channels of aid were fused—the UN Special Fund and the UN Technical Assistance Board to become a single Council for a UN Development Programme (UNDP). *See also* **Aid to Underdeveloped Countries, G10.**

Unicef.—Of all the United Nations agencies Unicef has most caught public imagination. In the early years of the war the attempt began to make amends to children whose early years had been shattered by war; and during the quarter century since Unicef has been bringing aid to millions all over Africa and Asia. Unicef does not draw directly on United Nations funds but voluntary help from Governments and individuals. There have been two developments of policy:

(1) a change in 1950 from post-war relief work to programmes of help for mothers and children in developing countries; and

(2) from 1960, an emphasis on education and vocational training rather than pure survival projects.

Human Rights.—The 20th anniversary of the adoption and proclamation of the Universal Declaration of Human Rights by the General Assembly on 10 December 1948 was marked by the observance of the year 1968 as International Year for Human Rights. There seemed, however, in 1968, a good deal to deplore as well as to celebrate. There had been a good deal of thinking on the subject and over two decades numerous conventions had been drawn up. But there had, unfortunately, been a good deal of obstruction and non-co-operation; and in 1968 the situation of slaves, political prisoners, and minorities of all kind was distressing. Let us take these two parts of the problem in turn—the resolution for improvement and the actuality.

Declarations and Conventions on Human Rights.—Every member of the UN endorsed the Universal Declaration of Human Rights. It marked the determination to prevent the recurrence of the genocide and brutality which occurred in the Second World War. Out of it sprang a Commission on Human Rights and numerous other Declarations and Conventions. Thus the European Convention on Human Rights prescribed that " no one shall be subjected to torture or to inhuman or degrading treatment or punishment " and there has been established a European Court on Human Rights. Among subsequent Declarations have been those on:

(1) Granting of Independence to Colonial Countries and Peoples.

(2) Elimination of All Forms of Racial Discrimination.

and among Conventions have been those on:

(3) Abolition of Slavery, the Slave Trade, and Institutions and Practices Similar to Slavery.

(4) Abolition of Forced Labour.

(5) Discrimination in respect of Employment and Occupation.

(6) Equal remuneration of Men and Women Workers.

(7) Freedom of Association and Protection of the Right to Organise.

(8) Descrimination in Education.

(9) Prevention and Punishment of the Crime of Genocide.

(10) Political Rights of Women.

Drafts were being prepared for Covenants or Conventions on:

(11) Civil and Political Rights; Economic, Social, and Cultural Rights.

(12) Elimination of All Forms of Religious Intolerance.

(13) Freedom of Information.

Finally an International Conference on Human Rights was due to be convened in 1968 in Tehran.

But after conventions are adopted at UNO they need to be ratified; thereafter signed; thereafter nations need to take the necessary action to enable the provisions to be put into force; and finally to put them into force. These are the stages between declaration of intent and fulfilment. As U Thant has said: "The mere adoption of various covenants and international agreements is not enough by itself." We need, therefore, to temper enthusiasm for intentions with critical regard for what is actually happening.

Why Nations Refuse to Ratify.—All kinds of political reasons are offered for failure to ratify and sign by big countries and small. America has signed three of the 19 International Conventions on Human Rights. It has ratified the Slavery Convention. The Russians have ratified nine and signed one. Britain has ratified ten and signed one. American reluctance to ratify is said to be fear of conferring on outsiders the right to interfere in their treatment of Negroes. Russia and other Communist countries oppose allowing individuals the right to petition against the State. Broadly Governments dislike minorities and about a tenth of the world's population are minorities; and that tenth comes to something like 300 million. Ironically the growth of independent countries has sometimes led to injustices for minorities, and an extension of the minority problem.

Minorities.—Mr. Colin Legum writing in *The Observer* identified the following minority problems:

Indians, Negroes	in N. America
Aborigines	in Australia
Flemings	in Belgium
Jews	in many countries
Nilotic tribes	in S. Sudan
Asians	in S. Africa
Nagas, Mizos	in India
Tamils	in Ceylon
Chinese	in Malaysia, Indonesia
Shans and others	in Burma
Arabs	in Israel
Kurds	in Iraq, Persia and Turkey
Ibos	in Nigeria

Greece and the European Court of Human Rights.—Greece was a signatory to the European Convention of Human Rights. But prisoners of the Greek military régime which seized power in the spring of 1967 were tortured. The Council of Europe's Ministers made no complaint; and presumably Greece, although a signatory to the Convention, could not be ordered to appear before the European Court of Human Rights. It was left to the Governments of Denmark, Netherlands, Norway, and Sweden to lodge a complaint which it was hoped would bring Greece before the Court.

The Persistence of Slavery.—Slavery persists today in five forms defined in the UN Supplementary Convention on the Abolition of Slavery (1956), namely chattel slavery, serfdom, debt bondage, sham adoption, and servile forms of marriage. The Anti-Slavery Society (for the Protection of Human Rights) stated in 1967 that it has recent information of the existence of one or more of these forms of slavery in thirty countries in the " free world." Apart from servile marriage the other forms probably embrace between one or two million people. This exploitation can only

be fought when governments legislate against it and their officials and people uphold the law. To encourage them to do so is the main function of the Anti-Slavery Society. Founded so far back as 1823 it is the principal organisation in the world working to end slavery; and it has consultative status at the Economic and Social Council at UNO. It supports the setting up of machinery to implement the slavery conventions called for in October 1967 by the Int. *Commission on Prevention of* discrimination and Protection of Minorities. Besides the eradication of slavery in all its forms the Society's aims include the abolition of labour systems resembling slavery and the protection and advancement of aboriginal and primitive peoples. The address of the Anti-Slavery Society is Denison House, Vauxhall Bridge Road, S.W.1.

The Anatomy of the United Nations has undergone ironical changes since its inception. At the outset the Security Council was built as the organ through which the Great Powers would together discharge their collective responsibility as policemen. They were the superior powers. They had the authority and the means to act as the big policemen to keep others in order. But this assumed that the big five permanent members would agree and act in concert. This is just what they did not do. As a result, in 1950, by Anglo-Saxon device, the General Assembly was mobilised to ensure action when action was vetoed in the Security Council. But over the last decade the Assembly has grown both in numbers and in the independence of its views. It is not at all as interested in the conflict with Communism as those assumed who vested it with additional power: it is more interested in colonialism. So those who gave the Assembly this additional strength would like to reverse the position. But here we confront another difficulty. China, one must expect (and hope), will join the Security Council. That will make the unity in that body which is vitally necessary for peacekeeping even more difficult.

The United Nations Comes of Age.—The United Nations met in the autumn of 1966 for its 21st General Assembly under a number of shadows. The challenges before them were:—

(1) Could the UN help to bring about peace in Vietnam and play a part in a durable settlement?

(2) Would the UN admit Peking to the organisation?

(3) Could it stop the spread of the manufacture of nuclear weapons; and could it check the arms race?

(4) Could it hasten the end of apartheid in Rhodesia, in S.W. Africa and in South Africa itself?

(5) Could it help the rich Western Powers in their recurrent efforts to save themselves sinking into recessions?

(6) Could it secure that the Western Powers gave the poorer countries not only sufficient aid but gave it in such ways as to afford them some real hope?

(7) Could the United Nations agree upon such effective and reliable peacekeeping machinery as would enable a small confrontation to be stopped before it grew into a bigger and out-of-hand conflict?

The Assembly commended the treaty on the peaceful uses of outer space; terminated the mandate exercised by South Africa in S.W. Africa; called upon States to refrain from actions which might hamper the conclusion of a treaty on the non-proliferation of nuclear weapons and called for the suspension of nuclear tests in all environments; approved two Covenants on Human Rights; arranged for the new UN Industrial Development Organisation to begin its work in 1967, its Headquarters being Vienna; established the UN Capital Development Fund to provide grants and long-term loans to developing countries; and reappointed U Thant as Secretary-General for a further term of five years.

The General Assembly's 22nd Annual Session in the autumn of 1967 faced three challenges: the spread of nuclear weapons, South Africa's intransigence in running South-west Africa, and the deadlock between Israel and the Arabs. But they could not meet these challenges and the Assembly therefore decided it was only in recess and would meet again in the spring of 1968. They ordered the Geneva disarmament conference to report to them by 16 March 1968 on its progress, if any, on a nuclear limitation treaty. The hopes of U Thant that there would be meaningful talks on Vietnam were frustrated.

China Again Excluded in 1967.—The General Assembly again barred Communist China from membership of the United Nations and upheld Nationalist China's right to a seat. The proposal to unseat Formosa in favour of Peking was rejected by 58 votes to 45 with 17 abstentions.

WESTERN INTERNATIONAL ORGANISATIONS.

1. Introduction

This outline is an attempt to explain the various organisations through which European countries are trying to co-operate. It is hoped that the reader, with the help of the chart will find the pattern less bewildering than at first appears. The destruction in Europe in the Second World War emphasised the need for greater union, both for recovery and for defence. A bewildering array of organisations has sprung up. They differ in form, in function, and in membership. Some overlap in function. Some are much less effective than others. The edifice is not, moreover, built on a single harmonious plan. Beneath the edifice are two different kinds of foundations, that is to say, two rival theories. These two theories (the federalist and the functionalist) are explained as the story unfolds. The story traces four main streams—the military, the political, the economic, and the scientific and technological—and describes the bodies which evolved in each stream.

Historic Origin of European Unity.—Sully, the famous Minister of Henry IV, King of France, outlined, in 1638, a proposal for achieving European unity and putting an end to war in Europe. He called it the "Grand Design." It was revived in modern dress by Monsieur Briand, the French Prime Minister, in 1929. During the War (1943) the concept of a United Europe which should be created after victory was won was outlined by Sir Winston Churchill: and he returned to the subject in his famous speech at Zurich University in 1946.

Two Starting Points: ERP and the Brussels Treaty.—There were two main sources of the present numerous European bodies. The first was the European Recovery Programme in 1947 (ERP), and the second was the Brussels Treaty of 1948.

The European Recovery Plan was popularly known as the Marshall Plan, as it was the result of the invitation made in 1947 by Mr. Marshall (then U.S. Secretary of State) to the European countries to draft a programme to put Europe on her feet economically. The U.S.A. was ready to give this aid if the countries concerned would agree on co-operation and plan their needs. In March 1948 the countries concerned created the Organisation for European Economic Co-operation (OEEC) to administer the programme of aid. This body was replaced by the Organisation for European Co-operation and Development in 1961.

The Brussels Treaty, 1948, was the other main source of the West European organisations. In March 1948 Britain, France, and the Benelux

countries (Belgium, Holland, and Luxembourg), agreed at Brussels to pursue a common policy on economic, political, and military collaboration, and to promote a better understanding of the principles which form the basis of the common civilisation of Western Europe. It also provided for the creation of a Consultative Council. This Council, when formed, was the Council of Europe, and it is described below, together with an account of all the organisations which stemmed from the Treaty. Italy and the German Federal Republic joined the Brussels Treaty Organisation in May 1955, which then became the Western European Union.

2. Military Organisations.

The Brussels Treaty and the Western Union Defence Organisation.—As we have seen, under the Brussels Treaty, so far back as 1948, the five Western Powers concerned pledged themselves to military collaboration; and in the same year they formed the Western Union Defence Organisation. At that time policy was being framed by a fear of a revival of German aggression. But in time this fear was replaced by distrust of the Soviet Union. There were two developments. In the course of seven years the Western Union Defence Organisation was transformed by the inclusion of the German Federal Republic itself and of Italy into a larger body called the Western European Union. How this change came about is described in the following paragraphs, which tell the story of the creation of the new Federal Republic of Germany, the proposal for a European Defence Community (which did not materialise), and the eventual emergence of Western European Union (in 1955). The second sequel of a military character of the Brussels Treaty was the creation of the North Atlantic Treaty Organisation (NATO). Whereas WEU is a regional organisation, NATO has an even larger range, as its members include Canada and the U.S.A. An account of NATO follows the story, to which we now turn, of the emergence of the new German Republic and its eventual incorporation in WEU.

Government of Germany after the War.—As a result of Germany's unconditional surrender on June 5, 1945, all power in Germany was transferred to the Governments of the four principal Allies. By decisions at Potsdam in 1945 that power was exercised by the Commanders-in-Chief of the U.S.A., the United Kingdom, the Soviet Union, and France, each being responsible in his own zone of occupation. On matters affecting Germany as a whole, the four would be jointly responsible as members of the Control Council. Berlin was divided into four sectors of occupation.

The London Conference 1947 of the four Foreign Ministers concerned failed to agree on a joint German settlement. Unfortunately, the effect was to set in motion political and economic developments which were speedily to make Germany the battleground of the conflict of ideas between Soviet Russia and the Western Powers. The Allied Control Council could no longer function efficiently; and by the end of 1948 four-Power rule had virtually collapsed and the partition of Germany was complete. A federal Parliament and Government were formed in Western Germany. The Soviet zone prepared a rival form of Government for East Germany.

Western Germany's New Status.—In May 1952 the German problem acquired a new complexion, when the so-called "Contractual Agreements" were signed by the three Allied Powers and Western Germany at Bonn. These Agreements did not form a Peace Treaty, but they attempted to define how W. Germany and the three Allied Governments should work together. Sovereignty was to be restored to Germany and she was to enter a military alliance with France. Indeed, a Treaty called the European Defence Treaty was drawn up between the four Powers, with Italy and the Benelux countries, which was to fit German Armed Forces into a Western European system. But this system, called the European Defence Community, never came to fruition as such, owing to the refusal of France to ratify the Treaty in 1954.

Collapse of EDC.—With the collapse of EDC there was a halt to the idea of a Political Community designed to embrace both the proposed EDC and the existing European Coal and Steel Community. It was logical that these two Communities formed by the same countries should not have separate institutions but should take their place within a single political community.

The London Nine Power Conference and the Paris Agreements, 1954.—Nine Powers met in London to devise a substitute for EDC. They were Belgium, Canada, France the German Federal Republic, Italy, Luxembourg, Netherlands, United Kingdom, and the U.S.A. The Conference considered how to assure full association of the German Federal Republic with the West and the German defence contribution. All the decisions which were reached formed part of one general settlement and these were embodied in agreements signed shortly afterwards in Paris. These decisions included the following:—

1. The occupation of W. Germany by Great Britain, the U.S.A., and France should end.
2. The German Federal Republic and Italy should join the Brussels Treaty Organisation.
3. The W. German Republic was admitted to the North Atlantic Treaty Organisation (NATO).

Western European Union.—These agreements took effect on May 5, 1955, when the occupation régime in Western Germany ended and the Republic attained full sovereignty and independence. At the same time the Republic became a member of the Western European Union (the expanded Brussels Treaty Organisation), which came into formal being on May 5, 1955, and also of NATO, to which we now turn.

The North Atlantic Treaty, 1949.—The founder members of this Pact (which widened the scope of the Brussels Treaty) were Great Britain, the U.S.A., Canada, France, Holland, Belgium, and Luxembourg. The parties agreed that an armed attack against one or more of them in Europe or North America shall be considered an attack against them all and consequently they agreed that if such an armed attack occurs, each of them, in exercise of the right of individual or collective self-defence recognised by the Charter of the UN, will assist the party so attacked.

Changing Problems in NATO.—How can the North Atlantic Alliance be kept together? As time goes on the problems of cohesion become greater. Circumstances have been against finding a solution. First, for some years there has been no avowed threat from the Soviet Union to Western Europe. Of course NATO comprises much more than that; but this brings us to the second great change. At the beginning of NATO there were only two substantial powers in the organisation—Britain and the United States. But now two more members have become substantial powers—France and Germany. So externally the threat has diminished and internally the difficulties of cohesion have increased. The key question has been the control of nuclear weapons. The United States is clearly not going to let control over its destiny leave its own hands. Nor will other powers leave ultimate control of their own destinies to an American President. The problem is not only how to create unity; but how unity is to be made effective for, and in, a crisis. Mr. Leonard Beaton has urged that what is needed is not a committee outside governments but a committee of governments, or at least the decisive governments, with the power and advice to manage a crisis. He uses the Anglo-American relationship in the second world war to illustrate

his point. In that war Prime Minister and President decided together, the issues being defined by intelligence men working together and the military men working together. In a crisis this would now need to be achieved for at least France and Germany as well: and very more quickly—in hours rather than weeks. The technique of hammering out an agreed course is the technique of the cabinet. A crisis cabinet, urged Mr. Beaton, able to act in the face of a challenge, was surely the only way to achieve unity between substantial powers such as NATO now contains. This involves extension of the apparatus of the existing Anglo-American relation.

A Crisis in NATO.—In 1966 it seemed that NATO was facing its gravest crisis since its inception in 1949. De Gaulle demanded that all foreign forces and military establishments in France should pass under French control or be withdrawn. He asked that SHAPE (NATO's military headquarters) and all other integrated headquarters then in France should be removed. In the words of *Punch* he was not only knocking SHAPE out of Europe but knocking Europe out of shape.

The New Position.—The general reason for de Gaulle's action was that the position in 1966 was fundamentally changed: (1) the threat of Russian aggression in Europe had receded for several reasons, including Russia's preoccupation with China; (2) the United States' guarantee of Europe, so important in 1949, was becoming less credible since, with the development of intercontinental missiles, America was now herself threatened with instantaneous nuclear retaliation against her own territory. It was not alliance with the United States which de Gaulle appeared to be rejecting but he was questioning the further need for integrated command and American domination of the alliance.

NATO in 1968.—The threat of French withdrawal in 1969 remained while NATO was occupied with the question whether it could be made flexible enough to respond to opportunities to reduce East-West tensions. To this end a report, the Harmel Report (named after the Belgian Foreign Minister), was discussed by NATO but had not been made public at the time of writing. Topics which seemed relevant for study were all-round force reductions by NATO and the Communist Powers; an approach to a European security conference; the problem of a divided Germany; the new Soviet presence in the Mediterranean (and of course in the Middle East). The position of NATO was further complicated by the announcement early in 1968 that the USA were determined to economise on the foreign exchange costs of US Forces in Europe.

3. Political Organisations.

Federal Union.—The development of greater political unity among the European countries may be best introduced by a word about the federalists. The Federal Union had, before the War, urged a federation of Europe as a first step in a progression towards a world federation. The Federalists advocated the surrender of absolute national sovereignty, a part of that sovereignty being vested in a federal authority. This authority, it was urged, should possess a government responsible to peoples and not to the States. It should have a Supreme Court to settle disputes between States which are members of the federation; and have an armed police force to uphold its decisions.

The Hague Congress, 1948.—Several schools of thought were represented at the Congress, one main difference being between the federalists, who want to create a real federation in Europe, and those, like the United Europe Movement, who were not committed to a federation in so far-reaching a sense. The Congress declared that the European nations must transfer some part of their sovereign rights so as to secure common action, and it demanded an early convening of a European Assembly chosen by the Parliaments of the participating nations. But in the event the political reality has not become so radical as the surrender of any sovereign rights to the Council of Europe.

The Creation of a Council of Europe.—In May 1949 the Foreign Ministers of the ten countries consisting of the five Brussels Treaty Powers and Denmark, Eire, Italy, Norway, and Sweden, concluded a formal Agreement called "The Statute of the Council of Europe." It set up a Committee of Ministers and a Consultative Assembly, forming together a Council of Europe. The Council was established twelve months after the Hague Congress, almost to a day. The Committee of Ministers provides for the development of co-operation between governments, while the Consultative Assembly provides a means through which the aspirations of the European peoples may be expressed. The seat of the Council was fixed at Strasbourg.

Council of Europe.—The Council came into existence in August 1949, and the Assembly opened at Strasbourg when M. Spaak was elected President. Mr. Churchill (as he then was) sat as an ordinary member. Procedure is a combination of British and Continental systems, but the design of the chamber follows the Continental pattern, delegates sitting at tables arranged to form a semicircle. In November 1949 the Council of Ministers agreed to meet the wishes of the Assembly that it would not in practice exercise its right of control to fix the agenda of the Assembly.

The Consultative Assembly.—This, the deliberative organ of the Council, is empowered to debate and make recommendations upon any matter which: (i) is referred to it by the Committee of Ministers with a request for its opinion, or (ii) has been approved by the Committee. The Assembly consists of representatives of each member state appointed by national parliaments. All resolutions of the Assembly require a two-thirds majority of the representatives casting a vote. The Assembly meets annually.

The Responsibility of Members of Assembly.—The Assembly comprises over two hundred individual members of Parliament from fifteen different countries. Although they are entitled to group themselves on any particular issue if they choose, a member is in particular relationship to his country and his party or even to his constituency. There is therefore a position of some confusion and subtlety. Originally the Deputies in the Strasbourg house were seated in alphabetical order of their names: today they sit grouped in political parties.

Relations with National Parliaments.—The attempt made by the Joint Committee between Ministers and the Assembly to act as an organ of co-ordination between the two sides of the Council did not satisfy the Assembly. It therefore set up a Working Party to analyse the relations between the Assembly and national parliaments. This Party tries to see what steps can be taken in each national parliament to secure consideration of recommendations and ratification of Conventions which have been approved at Strasbourg. They have gone so far as to appoint a spokesman for each country.

What Has the Council of Europe Achieved?—The Council plays an important part in law-making. It has itself framed and launched important Conventions like that on Human Rights, and it also frames general principles and gives opinions on texts of laws. On the diplomatic side it prepared the way for a solution of the Saar problem, which had divided France and Germany since the War. It is working on the simplification of frontier formalities, and it is concerned (in common with several other international bodies) with refugees. Among other actions, it has en-

couraged the growth in reciprocity between countries of their social services, and established a European Court of Human Rights.

4. Economic Organisations.

The Organisation for European Economic Co-operation (OEEC).—We now turn to the third stream, the economic. We have seen that OEEC was created to administer American (Marshall) aid. But it needed also to re-create a sound European economy. The allocation of aid continued until 1952; but the practice of mutual consultation on economic matters continued in order to carry out long-term programmes. Owing to the nature of its original task of distributing Marshall Aid, the U.S.A. and Canada became associate members of the Organisation. In 1961 these two countries formed with members of OEEC the Organisation for Economic Co-operation which replaced OEEC and is described below.

European Coal and Steel Community.—A further economic development came in 1950 with the proposal for the co-ordination of coal and steel production in Germany, Belgium, France, Italy, Luxembourg, and the Netherlands. The organisation of the Community is an example of co-operation on a supra-national basis, since the governing authority is not responsible to the individual governments of member countries but only to the Community. The High Authority has the right to deal directly with the coal and steel enterprises of the Community without passing through national governments. In 1954 Great Britain formed a Standing Council of Association with the High Authority for consultations on coal and steel and for co-ordination where necessary.

The European Economic Community (EEC), or Euromarket.—In 1955 "the Six" (namely the countries in ECSC) decided to drive towards further economic integration. This decision was taken at Messina, and the six are sometimes referred to as the Messina Powers. The EEC was established by a Treaty of Rome in 1958 and is an extension to the whole economic field of the institutional method of co-operation already adopted in the European Coal and Steel Community of the Six. The principal institutions are the Parliamentary Assembly (which is common to EEC, ECSC, and Euratom), a Council of Ministers, and an executive Commission of nine members. The common Parliamentary Assembly is now called the European Parliament. The Community is merging the Six into a single economic unit by harmonising economic, social, and investment policies and establishing a common market in trade.

What is a Common Market?—A common market is a trading area with no internal tariffs (import duties) or quotas (which are quantitative restrictions on imports) and a single external tariff and quota structure. The first tariff reductions on manufactured goods inside the Six (10 per cent.) took place on January 1, 1959. By January 1962 there had been cuts totalling 40 per cent. in internal tariffs. During 1960 the Council of the Community speeded up the process of further reductions which, on original intentions, would have taken from twelve to fifteen years, so as to aim at complete liberalisation of internal tariffs by 1966.

A European Free Trade Area.—When the Six were discussing the Common Market the British Government declared (1956) that they would consider joining a free-trade area in Europe. Although she would not join the Common Market scheme itself, she would consider sharing in the stage-by-stage reduction of inter-European tariffs on all non-agricultural goods. They would not attempt (unlike the Six) to standardise their own tariff walls in relation to the world outside the European free-trade area. Such a free-trade area would be independently controlled with permanent co-ordination with EEC. In November 1958 France rejected the British proposals for linking the six European common-market nations with the eleven other OEEC countries in a free-trade area. It appeared to the French impossible to establish a free-trade area between the six treaty powers and the other eleven OEEC countries without a single customs tariff between all of them and the outside world and without measures of harmonisation in the economic and social sphere.

The European Free Trade Association.—Thereupon seven countries outside the area of the Six formed a European Free Trade Association. They were Great Britain, Austria, Denmark, Norway, Portugal, Sweden, and Switzerland, and they agreed upon a plan at Stockholm in November 1959. Inside the free-trade area comprising these seven countries it was contemplated that there would eventually be no internal tariffs or quotas, but member states would retain separate external systems. The Seven, upon the foundation of their Association, immediately offered friendly co-operation to the existing Common Market. But the problem of finding a political link—called by the diplomatists the problem of the three half-crowns (seven and six)—remained a difficult one.

Britain's Application for Membership of the Common Market.—In the autumn of 1961 Britain applied for membership of the Common Market. Membership would provide this country with a much improved export opportunity but could lead equally to a sharp intensification of competition in our home market. In terms of population, purchasing power, production and growth, Western Europe is an exceptionally dynamic economy. The negotiations were stopped upon the veto of France in January 1963; and they were adjourned indefinitely. A detailed narrative of the negotiations will be found in Section G, Part III. The political aspects of the Common Market are discussed below.

Organisation for Economic Co-operation and Development.—This new body has taken the place of OEEC. Canada and the United States, who were associated members of OEEC, joined with the eighteen members countries of that body to set up OECD. The convention was signed in Paris in December 1960, and the new body came into existence in the autumn of 1961. Thus Canada and the U.S.A. join in facing the broader objectives and the new tasks of today, namely to achieve in Europe the highest sustainable economic growth, employment, and standard of living; to contribute to economic development; and to expand world trade on a multilateral and non-discriminatory basis, in accordance with international obligations. The scope of OECD has been further widened by the accession to membership of Japan.

Economic Commission of Europe.—As explained in the preceding outline of the UN, ECE was the first of the great regional commissions to be set up by UNO. It was created in 1947 to concert action for the economic reconstruction of Europe, and it was hoped to strengthen economic co-operation between all European members of UNO. Russia and some of the Communist Eastern European countries are members of ECE, and it is the only European organisation where the Western bloc and Soviet powers can meet for discussion and action.

5. The Political Aspects of Membership of the Common Market.

The Treaty of Rome, 1958, which had established the European Economic Community defined (in Articles 2 and 3) the principles and objects for which the Community is to work. Those articles specify in detail the steps for creating a Common Market, for approximating the economic policies of member States, the promotion of harmonious development of economic activities, and raising the standard of living. But the aim of "closer relations between its member States" is stated without elaboration. It is into this gap that

speculation is poured. No limit is set in the Treaty to the process of integration: on the other hand there is no commitment to join a Federation of Europe. While member States commit themselves to a common policy on a number of economic issues there will be co-ordination of national policies designed to take account of the needs of the rest of the Community.

European Commission — Council of Ministers

Economic and Social Committee
Consultative Committee

European Parliament — Court of Justice

Two Kinds of Political Aspects.—We need to distinguish between two things. First, the machinery by which the aims of the Common Market are to be achieved—the Commission, the Council of Ministers, the European Assembly, Court of Justice, and so on. This may be described as the political machinery of the Common Market. Second, we have to think of the kind of political relationship which will grow up, either by deliberate design or practical development, between member countries. We may think of the first set of facts as the engine or locomotive of the Common Market train; and we can regard the second as what sort of journey the train will take—will it take a direct run to federation or follow some other line?

The Organs of EEC.—The machinery of government of the European Economic Community (into which is now integrated the machinery for ECSC and Euratom) consists of:

1. The Council
2. The Commission
3. The Court
4. The Parliament or Assembly
5. The Economic and Social Committee (for the Common Market and Euratom): and
6. The Consultative Committee (for ECSC).
7. The Ambassadors of the member Governments.

The meetings of Ambassadors form unofficial permanent liason between Council and Commission. Let us examine the chief official organs.

The Council issues regulations and decisions which are, upon issue, binding in law on all member States. It consists of one member from each member State (normally a Cabinet Minister). They have votes as follows:

France	4 votes
Germany	"
Italy	"
Belgium	2 votes
Holland	"
Luxembourg	1 vote

The Commission.—Whereas the Council consists of politicians the Commission consists of permanent officials. There are nine members appointed by Governments, for a minimum term of four years and not more than two members may come from any one country. Its business is to further the general purposes of the Treaty and decisions are by majority vote. From the Commission flow two streams:—

(*a*) Proposals, which it sends to the Council.

(*b*) Under powers of its own:—

1. Decisions to named countries and binding on them.

2. Directives to named countries to achieve certain results, without specifying the means.

3. Recommendations and Opinions, which are not binding.

4. Authorisations without which many things are forbidden.

The Court, whose procedure is wholly Continental, consists of seven Judges appointed by Governments for a maximum of six years. Its word is final on the interpretation of the Treaty, on the rules made under the Treaty, and on the legality of all the actions of the organs of the Community.

The Parliament or Assembly consists of representatives of the national Parliaments. There are 142 representatives in all—36 from each of the three bigger powers, 14 from the two medium ones, and 6 from Luxembourg. It meets once a year as of right and its only power is to pass (by a two-thirds majority) a vote of censure on the Commission (the permanent officials) which must then resign. If Britain were to join its quota of members to the Assembly would presumably be 36. It is generally held that one day the Assembly will consist of representatives elected by direct universal suffrage but this will not occur until everybody is willing. In the meantime the Assembly can only consist of nominated parliamentarians.

The Working of the Organs: the Commission.—We look first at the Commission (of officials) as this is held to be by far the most powerful of the organs. Broadly speaking, it is the only body with a right of initiative, sending, as we have explained, proposals to the Council which cannot prepare its own proposals for consideration. The Commission can thus prevent the Council considering anything it does not want to be considered. Its proposals to the Council can normally be amended by the Council only by unanimous or qualified majority vote.

The Commission prepares the budget, takes member Governments into Court, runs the agricultural market and is the Monopoly and Restrictive Practices Court.

In addition to all this the Commission has its own powers as we have explained under heading (*b*) in the earlier paragraph about the Commission. By its *decisions* it can give orders to member States over a wide field. For example, it can give orders on the details of applying rules of free competition to nationalised industries or to industries with special rights. Its *directives* order the result to be achieved (for example the framework within which agricultural prices are to be negotiated). It gives (or refuses) *authorisations* over a wide range of subjects, like the postponement of the raising or lowering of a tariff in certain circumstances. The powers of the Commission are thus seen to be extensive and important and they affect, among many other matters, the running of nationalised industries and the uses of Government aid.

The Powers of the Commission contrasted with the Council.—That the Commission (of officials or "Eurocrats" as they have been called) are the real rulers of the Community is more clearly seen when that body is contrasted with the Council (of politicians), quite apart from the range and importance of the powers given to the Commission. The Commission decides by simple majority and can easily reach a decision; but the Council, which requires either unanimity or qualified majority, is often unable to make a decision. The Commission has almost all the right of initiative. It sits for a minimum of four years, while Council members come and go. The Commission meets as often as it wishes, the Council once a month. The Commission thus acquires a real personality but

not the Council. It is furthermore the Commission which controls the Community Civil Service.

The Bureaucratic Commission.—During Britain's first application for membership of the Common Market (1961–3) an important discussion took place in this country on the constitutional nature of the Commission and on the relative powers of Commission and Council. A most trenchant analysis of the Commission was made by Mr. William Pickles of the London School of Economics. He described the Commission as a bureaucracy of a kind which it would be impossible to contemplate in this country, for, in his view, it was entirely undemocratic. Mr. Pickles resumed the debate in 1967 and analysed the major developments within the Community in the past six years (see *The Listener*, 16 Feb. 1967). He found that, instead of a single Commission bureaucracy which he had originally complained of, there was now, alongside that, and very much enmeshed with it, a six-nation bureaucracy (a Committee of Permanent Representatives where the six understudies, as it were, of the Council members sit permanently—with technical staffs of their own—in Brussels). There had now developed, therefore, two closely interlocked bureaucracies, both without any kind of democratic control. Add to that de Gaulle's determination to fight for his national interests. We have not therefore discovered, argues Mr. Pickles, whether the Community can work without supranational powers (which British Ministers say they do not believe in). Mr. Pickles piquantly concludes that he does not want to see British representatives exchanging blows with the Continentals in the Community bear garden.

6. Scientific and Technological Organisations.

Euratom is the short title of the European Atomic Energy Community (EAEC) formed in 1957 to further the use of nuclear energy in Europe for peaceful purposes and to ensure that Europe does not lag behind in the atomic revolution. The negotiation for this Community opened at the same time, in 1956, as that for the Common Market and the Treaty for it was signed at Rome on 25 March 1957, when the Treaty for the Common Market was signed. Prior to the merger of the three Executives in July 1967 of the three executive bodies (the Common Market and Euratom Commissions and the ECSC High Authority) into a single Commission and of the three Councils into a single Council, Euratom was supervised by its own Commission. Euratom's rôle is to ensure that the Community undertakes the research necessary for the development of nuclear energy not only for power, but also, through the use of radioisotopes and radioactive sources, for agricultural, industrial, and medical purposes. It has joined international projects such as the European Nuclear Energy Agency (ENEA) *Dragon* project at Winfrith, Dorset, which is sponsored by OECD.

The Six to Co-ordinate Scientific and Technological Policies.—The Council of Ministers in 1967 reached agreement on a procedure for such co-ordination and for a report back to the Council from the Community's Medium-term Economic Policy Committee by 1 June 1968. Account would be taken of existing co-operation in other international organisations. These included ELDO (European Rocket Launcher Development Organisation), ESRO (European Space Research Organisation), and CERN (European Nuclear Research Centre) in all of which the Six are associated with Britain. ELDO has delegated technical management of its current space rocket programme to a six-nation industrial consortium (of eleven firms), including the United Kingdom and France. The urgency of the general problem has been sharpened by growing anxiety in Europe generally about the consequences of a technological gap, the difficulties actually encountered in *ad hoc* co-operation—in the aero-space sector, for example—and the extensive overlapping of effort and expenditure.

Britain's 7-Point Technology Plan.—Mr. Wilson's seven-point plan for European technology was outlined at the Lord Mayor's banquet in London in November 1967. The points were:

(1) Bilateral projects for technological co-operation in any field.

(2) Multilateral discussions to create a new dynamic in European technology.

(3) Discussions between the Confederation of British Industries and sister industrial organisations in Europe on a basis for integrated industrial and technological advance.

(4) To sponsor a multilateral European Institute of Technology.

(5) To organise "European Companies" on a basis which transcends national frontiers.

(6) To bring British arrangements in the field of patents, monopolies, and restrictive practices, and company law into line with a wider integration in conformity with the principles of the Treaty of Rome.

(7) To discuss with the trade union movement of the Six how the TUC and EFTA trade unions can play their part in promoting not only the industrial but also the social objectives of a collective European technology.

The scientific and technical development of European countries has been less rapid during the past years than that of countries outside Europe, particularly the United States.

The Comparative Scale of Scientific Research in EEC.—The number of scientists and research workers in EEC is only one quarter the number in the U.S.A. The U.S.A. spends seven times as much on research as the EEC countries. In the opinion of Professor Brzezinski (in the Faculty of Political Science at Columbia University), to whom we owe these figures, it is likely that the gap will widen, given the fact that scientific development is a dynamic process.

7. Recent Attitudes in Europe.

Merger of the Three European Communities.—The Common Market complex advanced a further step by an agreement in 1965 for the merging of the executives of the Economic Commission, the Coal and Steel Pool, and Euratom. This meant that in 1967 there was a single Commission of 14 members instead of three Commissions of 23 members. By July 1968 the Six will have constructed a customs union whereby:

(1) all customs duties and restrictions on trade in industrial goods within the Community will have been abolished; and

(2) a common external tariff will have come into effect.

It was also agreed that the common farm policy would be completed by that date.

What kind of political system will be built to control the European Community with a unified executive? France was asking in 1965 for revision or interpretation of the Rome Treaty on two important points: (1) the powers of the Commission; and (2) whether a majority voting system should replace unanimous voting in the Council of Ministers in January 1966 as laid down in the Treaty. On the second point it should be explained that the Treaty provides for a transition from unanimous agreement of the Council to weighted majority to be achieved by stages, the first stage from 1958–61, the second to the end of 1965, and the third stage ending 1970. It was the step due on 1 January 1966 which caused objection by France. France had absented herself for some time from the Council of the Six, causing a serious break between her and the other five member countries.

France and the Five Agree to Disagree.—France, which had withdrawn from the Council of Ministers in July 1965, in violation of the Treaty

of Rome, returned at a critical meeting at Luxembourg in January 1966. Neither France nor the Five were prepared for their differences to lead to a total breakdown. The Treaty of Rome's provision for majority voting remained unaltered; but France's insistence on a right of veto was met by the Five agreeing that every effort should be made for a reasonable period to secure unanimity on issues of importance. The Common Market thus survived but continued in a state of nervous tension. Everything turned on de Gaulle's actions and intentions. The four-point face-saving agreement may be summarised as follows:

(1) When very important issues of one or more partners are at stake the members of the Council will try, within a reasonable time, to reach solutions which can be adopted by all the members of the Council, while respecting their mutual interests and those of the Community.

(2) The French delegation considers that where very important issues are at stake, the discussion must be continued until unanimous agreement is reached.

(3) The six delegations note that there is a divergence of views on what should be done in the event of a failure to reach complete agreement.

(4) This divergence does not prevent the community's work being resumed by normal procedure.

Britain and the Common Market.—We may note the five conditions which had been set out by Mr. Gaitskell to be satisfied before Britain could contemplate joining the Common Market:

(1) proper safeguards for the Commonwealth;

(2) adequate arrangements for our partners in EFTA;

(3) firm guarantees for British agriculture;

(4) freedom for Britain to pursue an independent foreign policy; and

(5) freedom to carry out national economic planning with effective powers to safeguard Britain's balance of payments.

By 1966 Britain's trade with the Commonwealth had declined and many Commonwealth countries had made other arrangements which lessen their dependence on the British market. It remains true that EFTA countries must come within any final European pattern. Agriculture in Britain remains a difficult factor as indeed French agriculture does within the Market. The fourth item about independent foreign policy is not strong since our policy is necessarily shaped by alliances and the United Nations; and it has been doubted whether our balance of payments position would be weakened if we were part of a strong European Community. But the condition which has not been firmly enunciated and is of paramount importance is that the political arrangements of the Common Market must be democratic in form. Can the Commission which has large powers be made answerable to a properly elected European Parliament? Another condition would be that a European union would not jeopardise an Atlantic alliance. *See also* Section G, Part III.

Reappraisal of Attitude to the Common Market.—After the General Election of 1966 the Government made a thorough re-examination of all the arguments for and against British entry. This was the first fundamental reappraisal of the position since the Whitehall exercise in 1960 which preceded the application for membership in August 1961. Mr. Gaitskell had rated the economic pros and cons at fifty-fifty but had emphasised the serious adverse effect on the balance of payments which accession would be likely to bring in the immediate future. The reappraisal in 1966 was believed to have concluded that membership on balance would be in the British interest—that is to say, it was more enthusiastic than Mr. Gaitskell. But the July 1966 crisis occurring in the middle of this appraisal strengthened the argument of those who saw the weakness of the British economy as a barrier to membership. The Government has stated that the best estimate it could make on the then existing Community arrangements and prices was that, after any transitional period, the adverse effect on the balance of payments might be of the order of £175 million to £250 million, and on retail food prices by 10 to 14 per cent, which represents 2½ to 3½ on the cost of living. It seemed that mid-1968 might politically offer a suitable moment for Britain to join; but the argument by reference to the state of the British economy might well still apply then. Why 1968? It is in that year that the six members of the Common Market will complete their construction of a single market for both industrial and farm goods.

Britain and the Common Market: New negotiations.—The Government, however, decided in November 1966 to open talks first with the EFTA countries and then with EEC countries to find out if the conditions did, or did not, exist for fruitful negotiations for Britain's entry into the EEC. The purpose of the conference with EFTA was to demonstrate solidarity with Britain's partners there and to help them to consider their own plans, either to apply for membership of the Common Market or to seek some form of association with it. As things then stood Sweden, Norway, and Denmark were expected to seek full membership with Britain. The Irish Republic which was outside EFTA was also expected to apply. Mr. Wilson said he would approach the discussions "with the clear intention and determination to enter the Community, if, as we hope, our essential British and Commonwealth interests can be safeguarded." Among the stiff obstacles hindering Britain's entry was of course President de Gaulle's attitude to Britain's defence arrangements with the United States. (It was the Nassau agreement that led de Gaulle to veto Britain's entry into EEC.) In his declaration of intent in November 1966—or, more accurately, of desire—Mr. Wilson said that matters of defence or of foreign policy are not directly involved in negotiations on the Common Market. It is true that there is nothing in the Rome Treaty that requires us to hand over power to a European authority or Parliament on subjects which are not related to an economic union. But economic union needs political direction and this corollary needs to be faced, although the Common Market countries themselves have not yet decided on the precise forms of its political institutions. There were of course strong economic obstacles, as we have indicated, in regard to both balance of payments and cost of living.

De Gaulle Again Bars Door to British Entry, 1967.—At his press conference of 27 November 1967 de Gaulle argued that the report of the Brussels Commission of 29 September 1967 demonstrated that the present Common Market was incompatible with the economy "as it is" of Britain. The incompatible features, were said to be Britain's chronic balance of payments deficit; her sources of supply; her working conditions; "the way the English get their food"—partly by subsidising their own production and partly by food bought cheaply all over the world and particularly in the Commonwealth; and other features. He said we were watching the fifth act of a play in which England had taken up "very different and apparently inconsistent attitudes towards the Common Market." The British Government quickly published a detailed rejoinder.

Negotiations with Britain Suspended.—The British Government made it clear that they expected a reply from the Six. Their announcement, after the General's press conference, was to be interpreted as meaning that de Gaulle was speaking for himself, but the decision rested not with France solely but also with the other five members. "We have made an application in full accord with the terms of Art. 237 [of the Treaty of Rome] and we expect a reply from the Community." When the Council of Ministers of the

Community met again in December 1967, France voted against negotiations for British membership and this was in effect a French veto. The application by Britain remained on the table and any member state could raise the matter again before the Council. The action of France raised a question mark upon the future good functioning of the Community itself.

An Assessment of Impact.—Opinions differ as to the real impact in recent years of the various West European bodies. A crisp view by Dr. Roy Price, Director of the Centre for Contemporary European Studies, University of Sussex, may be quoted. He wrote:

> "NATO is in disarray; WEU has never been much more than a diplomatic ghost; EFTA, though it has succeeded in its commercial aim, has failed to reach its primary target—a single European market; and the OECD is primarily concerned with technical matters. The Council of Europe performs many useful functions, but offers no long-term possibilities of influence on major European or extra-European policy issues."

At the same time Dr. Price believed that a primary aim must be to express a common European position with regard to the United States. In the formulation of such policies Britain would necessarily play an important part; and beneath the surface of events, he detected the emergence of the outlines of a consensus.

EFTA Countries and the Common Market.—Not all Britain's partners in EFTA want to join the Common Market. Switzerland doubted whether membership would be compatible with its neutrality. Austria has been negotiating associate membership for some time; but even if accepted it is doubtful if the Soviet Union would sanction it under the terms of the Austrian Peace Treaty which established Austria's neutrality. Portugal was unlikely to apply, or to be accepted so long as her economy remains a weak one. Finland was unlikely to seek more than associate membership, for a mixture of economic and political reasons. That leaves Sweden, Norway, and, above all, Denmark, who really seek membership.

Last Industrial Barriers down in EFTA.—A free trade area for industrial goods among the seven members, supplying a market of 100 million people, came into existence on 1 January 1967 when the last 20 per cent barrier of protective tariffs was removed, thus completing a process begun by stages in July 1960. This complete dismantling of tariffs was three years ahead of schedule. Most agricultural and marine products continued to be subject to tariffs.

Need for Large Free Trade Area: the alternatives.—This is not the place to examine the economic pressures behind the approach to membership of the Common Market. More and more industries are discovering that a large tariff-free market is necessary not only to justify large, low-cost productions but to generate the resources to finance research and development. But we may note some political aspects. A possible alternative might be an Anglo-Saxon free trade area containing U.S.A., Canada, Britain, and bits of EFTA. This is the "51st State" solution. It would mean eventually a far larger ownership of British industry by the U.S.A. and perhaps eventually the absorption of Britain. (The Commonwealth alternative continues to shrink. Nigeria is an associate of the Common Market and East African states should follow by 1968. Malaysia, New Zealand, and Australia are being drawn more and more into Asian trade.) Other political aspects are: (1) will the Common Market wish to, and be able to, develop common policies towards Eastern Europe including eventually common policy on Germany unity? An effort to open up a new relationship with Eastern Europe is one which would be likely to attract de Gaulle; and (2) what should be the relationship of America to a more united Europe? It must be a long time before Britain could contemplate the abandonment of NATO.

MEMBERSHIP OF EUROPEAN AND WESTERN ORGANISATIONS

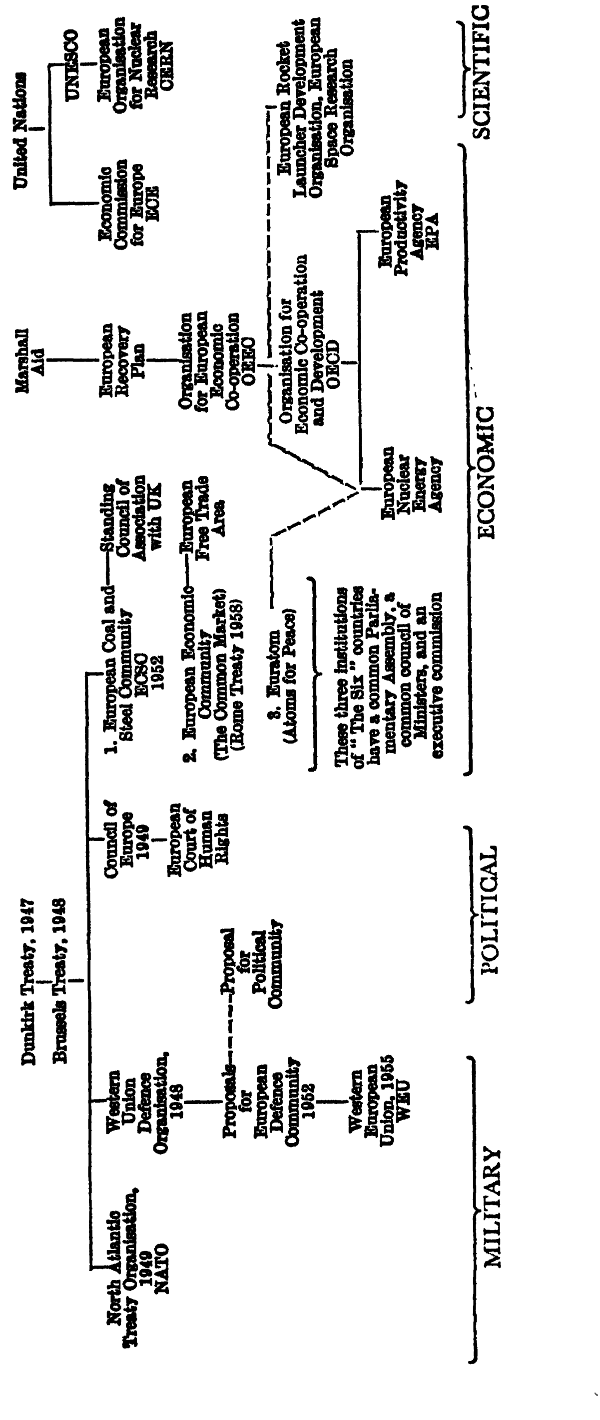
GROWTH OF WESTERN INTERNATIONAL ORGANISATIONS



WILSON'S SECOND LABOUR CABINET

(as reconstructed 5 April 1968)

Prime Minister and First Lord of the Treasury—Harold Wilson.
Secretary of State for Foreign Affairs—Michael Stewart.
Chancellor of the Exchequer—Roy Jenkins.
Lord Chancellor—Lord Gardiner.
Lord President: in charge of Health and Social Security—Richard Crossman.
First Secretary of State and Secretary of State for Employment and Productivity—Barbara Castle.
Home Secretary—James Callaghan.
Secretary of State for Defence—Denis Healey.
Leader of the House of Commons and Lord Privy Seal—Frederick Peart.
Secretary of State for Economic Affairs—Peter Shore.
President of the Board of Trade—Anthony Crosland.
Secretary of State for Education and Science—Edward Short.
Secretary of State for the Commonwealth—George Thomson.
Secretary of State for Scotland—William Ross.
Secretary of State for Wales—George Thomas.
Minister of Technology—Anthony Wedgwood Benn.
Minister of Agriculture, Fisheries, and Food—Cledwyn Hughes.
Minister of Power—Raymond Gunter.
Minister of Transport—Richard Marsh.
Minister of Housing and Local Government—Anthony Greenwood.
Paymaster General and Leader of the House of Lords—Lord Shackleton.

SPEAKER TO THE HOUSE OF COMMONS—Dr. Horace M. King.
LEADER OF THE OPPOSITION—Edward Heath.
GOVERNMENT CHIEF WHIP AND DEPUTY LEADER OF THE HOUSE OF COMMONS—John Silkin.

MINISTERS NOT IN THE CABINET

Chancellor of the Duchy of Lancaster—Frederick Lee.
Minister of Health—Kenneth Robinson.
Minister of Social Security—Judith Hart.
Postmaster-General—Roy Mason.
Chief Secretary to the Treasury—John Diamond.
Minister of State, Treasury—Dick Taverne.
Minister of Defence (Administration)—Gerald Reynolds.
Minister of Defence (Equipment)—John Morris.
Minister of State, Department of Economic Affairs—Thomas Urwin.
Ministers of State, Department of Education and Science—Shirley Williams, Jennie Lee, Alice Bacon.
Ministers of State, Foreign Office—Frederick Mulley, Goronwy Roberts.
UK Representative at United Nations—Lord Caradon.
Disarmament—Lord Chalfont.
Minister of State, Home Office—Lord Stonham.
Minister of State, Commonwealth Office—Lord Shepherd.
Ministers of State, Board of Trade—Edmund Dell, J. P. W. Mallalieu, Lord Brown.
Minister of State, Technology (Aviation)—John Stonehouse.
Minister of State, Housing, and Local Government (Land and Natural Resources)—Niall MacDermot.
Minister of Overseas Development—Reginald Prentice.
Minister of Public Building and Works—Robert Mellish.
Minister of State, Transport—Stephen Swingler.
Minister of State, Scottish Office—J. Dickson Mabon.
Minister of State, Welsh Office—Eirene White.
Attorney-General—Sir Elwyn Jones.
Solicitor-General—Sir Arthur Irvine.
Lord Advocate—Henry Stephen Wilson.
Solicitor-General for Scotland—E. G. F. Stewart.

A LIST OF SOCIETIES.

On this page are the addresses of some of the societies working in the fields of social service and international affairs. They are only a selection from all the societies working in these and allied spheres.

What the Societies Offer.—Many of the societies offer the facility of a unique specialised library, and most of them issue not only journals and magazines but pamphlets giving the latest authoritative views and discussions of contemporary problems. Besides these facilities the associations offer the individual the opportunity of hearing experts and of discussing the subject with others interested in the same subject. Many societies hold not only lectures but conferences, covering the week-end or several days, and some of them hold Summer Schools.

Social Service.

The National Council of Social Service (26 Bedford Square, London, W.C.1) is the main promotional and co-ordinating organisation of voluntary social work in Great Britain. It publishes *Handbooks on Voluntary and Public Social Services and Directory of Organisations.*

The Annual Charities Register and Digest is a famous reference book prepared by the Family Welfare Association (address below). It is a standard guide to every branch of charitable work, giving details of Adoption Societies, Almshouses, Homes for Incurables, Convalescent Homes of all kinds, and all Welfare Institutions.

Some useful addresses are:—

British Association of Residential Settlements, Bishop Creighton House, 378 Lillie Rd., S.W.6.
Central Council for Health Education, Tavistock House, Tavistock Square, W.C.1.
Citizen's Advice Bureaux Service, 26 Bedford Square, W.C.1.
Family Planning Association, 231 Tottenham Court Rd., W.1.
Family Welfare Association, 296 Vauxhall Bridge Rd., S.W.1.
Industrial Welfare Society, 48 Bryanston Square, W.1.
Institute for the Study and Treatment of Delinquency, 8 Bourdon St., Davies St., W.1.
National Association of Parish Councils, 26 Bedford Square, W.C.1.
National Association of Boys' Clubs, 17 Bedford Square, W.C.1.
Scottish Association of Boys' Clubs, 12 Alva St., Edinburgh, 2.
National Association of Youth Clubs, 30–2 Devonshire St., W.1.
Scottish Association of Girls' Clubs, 13 Eglington Crescent, Edinburgh, 12.
National Council of Women, 36 Lower Sloane St., S.W.1.
National Council of Y.M.C.A.'s, 112 Great Russell St., W.C.1. 10 Palmerston Place, Edinburgh, 12. 22 Howard St., Belfast.
National Federation of Community Associations, 26 Bedford Square, W.C.1.
National Federation of Women's Institutes, 39 Eccleston St., S.W.1.
Federation of Women's Institutes of Northern Ireland, 28 Bedford St., Belfast.
National Federation of Young Farmers' Clubs, 55 Gower St., W.C.1.
National Marriage Guidance Council, 58 Queen Anne St., Grosvenor Square, W.1.
National Union of Townswomen's Guilds, 2 Cromwell Place, S.W.7.
Save the Children Fund, 29 Queen Anne's Gate, S.W.1.
Scottish Council of Social Service, 10 Alva St., Edinburgh, 2.
Northern Ireland Council of Social Service, 28 Bedford St., Belfast.
Tavistock Institute of Human Relations, 3 Devonshire St., W.1.
Young Women's Christian Association, 108 Baker St., W.1. 18 Atholl Crescent, Edinburgh, 3. 385 Malone Rd., Belfast.

International Co-operation.

The National Peace Council (29 Great James St., W.C.1), is a federation of national societies concerned in the promotion of peace. It publishes the *Peace Year Book*, which contains a directory of societies working for peace.

United Nations Association, 25 Charles St., W.1.
Union of Democratic Control, 13 Prince of Wales Terrace, W.8.
Women's International League for Peace and Freedom, 29 Great James St., W.C.1.
International Voluntary Service, 72 Oakley Square, N.W.1.
British Society for International Understanding, Benjamin Franklin House, 36 Craven St., W.C.2.
International Friendship League, Peace Haven, Creswick Rd., W.3.
Friends Peace Committee, Friends House, Euston Road, N.W.1.
Africa Bureau, The, 65 Denison House, Vauxhall Bridge Rd., S.W.1.
Britain in Europe Committee, 43 Parliament St., S.W.1.
Fabian International Bureau, 11 Dartmouth St., S.W.1.
English Speaking Union, 37 Charles St., W.1.
Council for Education in World Citizenship, 25 Charles St., W.1.
Royal Institute of International Affairs, Chatham House, 10 St. James's Square, S.W.1.
Parliamentary Group for World Government, House of Commons, S.W.1.
Fellowship of Reconciliation, 29 Great James St., W.C.1.
Peace Pledge Union, Dick Sheppard House, Endsleigh St., W.C.1.
Campaign for Nuclear Disarmament, 2 Carthusian St., E.C.1.
War on Want, 9 Madeley Rd., W.5.
Institute of Race Relations, 36 Jermyn St., S.W.1.
United World Trust, 29 Great James St., W.C.1.
Oxford Committee for Famine Relief, 274 Banbury Rd., Oxford.
British Council of Churches, 10 Eaton Gate, S.W.1.
World Assembly of Youth (British National Committee), 57 Charlton St., N W.1.

Some Other Societies.

Political and Economic Planning, 16 Queen Anne's Gate, S.W.1.
Howard League for Penal Reform, 6 Endsleigh St., W.C.1.
Progressive League, 13 Prince of Wales Terrace, W.8.
Ethical Union, 13 Prince of Wales Terrace, W.8.
Electoral Reform Society, Albany Institute, Creek Rd., S.E.8
Women's Co-operative Guild, 348 Grays Inn Rd., W.C.1
Workers' Educational Association, 27 Portman Square, W.1.

(*Note:* Unless otherwise stated the above addresses are in London, and this is further indicated by the postal number, *e.g.*, S.W.1 Correspondents writing from places other than London should include "London," as well as the postal number, in the address.)

THE LAW OF ENGLAND

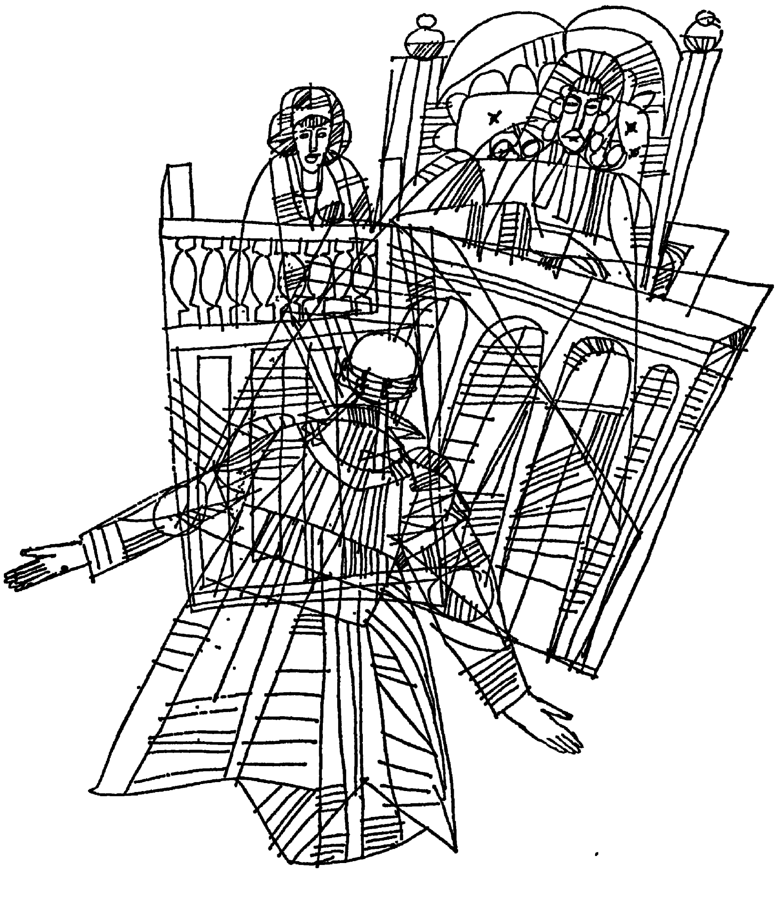


TABLE OF CONTENTS

THE LAW OF ENGLAND

A.—The Sources

Comprising

COMMON LAW — CASE LAW — EQUITY* — STATUTE LAW

B.—The Sub-divisions

I. CONSTITUTIONAL LAW.	II. CRIMINAL LAW, dealing with the relations between the individual and the State.	III. STATUS.	IV. LAW OF PERSONS,* dealing with the relations between one individual citizen and another, established—		V. LAW OF PROPERTY.*		
Main Principles: 1. The Supremacy of Parliament. 2. The Rule of Law. (a) *The Legislature:* The franchise, elections, Parliamentary procedure, relations between Lords and Commons, Bills and Acts. (b) *The Executive:* The Crown, the Ministry, Government Departments and their powers. (c) *The Judiciary:* The Courts and their functions, the Judges, means of controlling the Executive and inferior courts. (d) *Local Government:* County, Borough, Urban and Rural District and Parish Councils and their powers.	A. Grave offences against— 1. *Public Order:* Treason, sedition, riot, blasphemy, obscenity, forgery, bigamy, perjury. 2. *Persons:* Homicide, assault, sexual offences. 3. *Property:* Larceny, burglary, housebreaking, false pretences, blackmail. Subsidiary matters: (a) Criminal responsibility. (b) Unconsummated Crimes. (c) Joint Crimes. (d) Punishment and its purpose. B. *Petty Offences, e.g.,* Road Traffic, Factories and Shops, Sale of Food, etc. (dealt with by J.P.s)	1. Nationality. 2. Domicil. 3. Marriage and Divorce. 4. Infancy. 5. Lunacy. 6. Bankruptcy. 7. Corporations. 8. Adoption.	1. *By act of parties (Law of Contract):* (1) Simple Contracts. (2) Deeds: (a) Capacity of parties. (b) When writing necessary. (c) Mistake. (d) Misrepresentation. (e) Duress and undue influence. (f) Illegality. (g) Breach.	2. *By Law (Law of Tort):* Civil Wrongs committed against— (1) *The Person:* Trespass, assault, malicious prosecution, and false imprisonment. (2) *Land:* Trespass, Nuisance. (3) *Other Property:* Trespass, Conversion. (4) *Persons towards whom there is a duty to take care:* Negligence. (5) *Reputation:* Defamation (libel or slander). (6) *Personal and Trade Relationships:* Seduction, enticement, trade molestation *and*— (a) *Liability.* (b) *Immunity.* (c) *Effect of Death.* (d) *Remedies.*	IN GENERAL: 1. *Living Persons:* (Effect of Status on Ownership). 2. *Deceased Persons:* (Wills and Intestacies, Probate and Administration).	IN LAND (Immoveable Property): 1. Freeholds (Settlements). 2 Leaseholds. 3. Mortgages. 4. Title. 5. Joint Ownership.	IN OTHER PROPERTY (Moveable Property): 1. Chattels. 2. Things in action.

* *Note:* Equity is applied only in matters of civil law relating to persons and property. It has no application to constitutional or criminal law.

THE LAW OF ENGLAND

THE Table set out on D3 shows in concise form—

A—the sources, and
B—the subdivisions

of the Law of England. The intention is to give a general picture of the whole system in tabular form, to explain briefly what the Table represents, and finally to deal, in slightly more detail, with a few selected subjects which may be of particular interest to the ordinary reader

A word of warning is necessary. Learned text-books have been written on every one of the many subjects referred to in the Table, and the application of the law in any particular case is a matter for the professional expert. The following pages do not claim to do more than to make a brief survey of the whole field of English Law, for the general guidance and interest of the ordinary citizen. The system of English Courts is set out in tabular form on D43–4.

A. THE SOURCES OF ENGLISH LAW

The citizen who desires to make some acquaintance with the English Legal System must begin by disabusing himself of several popular fallacies: for example, that it is a fixed and unalterable code, that it is strictly logical, that it is coldly impersonal and uninfluenced by human factors. The history and practice of the law display precisely the opposite characteristics.

1. COMMON LAW AND CASE LAW

The English Legal System is a *living organism*, not a dead, static code. The system as we know it began to develop in the twelfth century, when Henry II extended the practice of sending the royal judges about the country "on circuit," to deal with crimes and disputes, and to adapt and give official authority to the best of the local customs, some of which had been in force since Anglo-Saxon days. The judges did this by *empirical methods*—that is, by practical, common-sense decisions on the actual cases brought before them, and by setting out their reasoning in detail. Simple records of the most important decisions were kept from the earliest times; as the centuries passed, the gradual elaboration of a system of *law-reporting* ensured that the *facts* of significant cases, the *reasoned judgments* delivered on those facts, and the *principles* those judgments enshrined, should be recorded and preserved; at the same time the doctrine of *precedent*—the rule that those principles, enunciated by a superior court, should be followed by all courts inferior to it—ensured consistency throughout the country. Thus there was gradually developed a body of principles—living, growing, and adaptable to new sets of facts as they arose; principles, moreover, which rose above local differences of custom and became *common* to the whole Realm. Hence the expression *common law*.

Case Law. The system we have described is by no means a thing of the past: it is still in force today. New circumstances are continually arising; cases come before the judges for decision, and it frequently happens that the principles laid down in the past do not apply precisely, in all respects, to the particular facts in point. When this occurs it is the judge's right and duty to *interpret and adapt the principle to the new facts* before him; his judgment is reported, and his reasoning made clear. The adapted principle of that judgment becomes part of the law of England; it must be followed by all inferior courts; and it will not be ignored or abandoned by courts of the same rank, or any superior court, without reasoned argument and careful consideration. Thus the practising lawyer can never sit back with the comfortable assurance that he has "completed" his studies: he must continually keep his knowledge up to date. The practice of law is not a science, based on rigid rules, but an art—the art of *applying the known principles to the facts of new cases* as they arise.

In July 1966 the House of Lords (the Supreme Court of Appeal) announced that it would henceforth regard itself as free to depart from its own previous decisions when it appeared right to do so, though this power would be sparingly used.

2. EQUITY

But the English genius for practical improvisation has never excluded spiritual and *ethical motives* of conduct. For hundreds of years the Church was a great power in the land, extending its influence far beyond the strictly ecclesiastical sphere. The great church-leaders of the past took an important part in the secular activities of government and administration; from an early date the King's Chancellor was an ecclesiastic. The Chancellor was not only the King's Secretary of State and Keeper of the royal seal; as royal chaplain he was "the Keeper of the King's conscience." It was to him, therefore, that the King turned for advice on matters of state where *ethical and moral considerations* were involved.

All human institutions are fallible, and the rough-and-ready methods of the early common law sometimes fell short of those ideals of abstract justice that inspire men's minds. Despite, or perhaps because of, its practical outlook, the common law tended to become circumscribed by its own precedents. As the machinery of justice became more elaborately organised, the idealistic doctrine—"Where there is a right there is a remedy"—was apt to degenerate, in practice, into the realistic but soulless form—"Where there is a legal remedy, there is a legal right." Too close an adherence to legal formalities led sometimes to a denial of justice. This was particularly so for the weak, who could not help themselves—feeble-minded persons, tricked or cajoled into "legally" signing away their property; infants unconscionably treated by guardians who, having got legal custody (under a will or otherwise) of the infants' inheritance, refused to honour their solemn trust; borrowers who, having delayed beyond the date fixed for the repayment of a loan, found themselves deprived, under the strict terms of the mortgage deed, of property many times more valuable which they had pledged only as security. For such cases as these the common-law courts provided no remedy, since the victims had suffered *no actual illegality*. Petitions were therefore sent to the King, "the father of his people," begging him to right such wrongs; and the question of redress was delegated by the King to his Chancellor. The Chancellor had no power directly to revoke or interfere with the decisions of the royal judges by depriving the oppressive party of the property he had "legally" acquired, but he could, and did, insist that that party should not enjoy such acquisition, *unconscionably*, for his own sole advantage. The defaulting guardian, though he continued legally to hold the infant's property, was compelled to use it for the infant's benefit;

the oppressive creditor, who had legally got possession of or sold the debtor's estate, was permitted to take out of the proceeds the amount of his loan, with reasonable interest and expenses, but must hand back the balance to the debtor. Thus the Chancellor administered a kind of *abstract justice*, based upon the promptings of conscience, and not on legalistic rules. He dealt with these cases in his own court—the Chancellery or *Chancery*—where the yardstick was *equity*—that which was right or fair. And over the centuries the principles on which the Court of Chancery acted became crystallised into a set of rules which followed their own precedents and made *conscientious conduct* their guiding star.

Naturally enough, the activities of the Court of Chancery were viewed with jealousy and misgiving by the royal judges of the Common Law Courts, and many were the clashes between the two. Equity, however, had come to stay, and the two systems were administered independently until as late as 1873. In that year Parliament passed the Supreme Court of Judicature Act, which (in effect) fused the two systems into one. By means of that and subsequent legislation there was constituted *one High Court of Justice*, of which the *Queen's Bench Division*, the *Chancery Division*, and the *Probate, Divorce* and *Admiralty Division* are component parts. The first-named is concerned primarily with common-law suits, the second with equitable matters; but both these Divisions must have regard to *both common law and equitable principles*. In case of a conflict of principles, those of equity are to prevail. The last-named Division (for historical reasons) deals with the diverse subjects of wills and intestacies, matrimonial suits, and disputes relating to ships at sea. Criminal cases fall within the jurisdiction of the Queen's Bench Division, but are dealt with in special courts. The criminal law (in strict fairness to accused persons) must be absolutely certain and clearly defined; it is administered on strict legalistic principles, from which the doctrines of equity are excluded.

3. STATUTE LAW

While, as we have shown, the Courts have the function of *interpreting and adapting* the principles of law laid down in earlier times, they cannot legislate—*i.e.*, *the Judge cannot make new laws*, or repeal or amend old laws, even when changes are rendered desirable by developing social conditions. The law-making body, or *Legislature*, is *Parliament*. *A Statute* or *Act of Parliament* is the joint act of the Queen, the House of Lords, and the House of Commons; while each of these three "Estates of the Realm" has its own functions, new law can be made, and old law repealed, only by these three Estates acting together, *i.e.*, by *Parliament*, or by some person or body of persons to whom Parliament has *delegated authority* to make *rules having the force of law*. Parliament is free of control by any written constitution or any person or body of persons whatsoever; an Act of Parliament must be enforced by all courts as the law of the land, unless and until it is repealed or amended by Parliament itself. Parliament is not bound by the Acts of a previous parliament, which it is free to repeal or amend as occasion may require. It is equally free to modify the rules of the common law and the rules of equity, however firmly entrenched; but those rules, unless and until modified by parliamentary legislation, continue to guide the Judges both in their interpretation and enforcement of *Statute Law*—*i.e.*, the body of Acts of Parliament still in force for the time being—and in their decisions on those common-law and equitable rules which the Statute Law has left untouched. For example, the Peerage Act, 1963, enables a peer to renounce his title and to become a commoner for all purposes, including voting for, and standing as, a candidate for the House of Commons. And by the Law Commission Act, 1965, a body of Commissioners was appointed: (1) to consider various branches of the law; (2) to consolidate and codify the law wherever possible; (3) to draft reforms on certain subjects. The Commission's Second Report, issued in June 1967, reviews recommendations for the first two years of its activities and is summarised on D41–2 or referred to under various headings in the text that follows.

THE ENGLISH LEGAL SYSTEM

These three main streams—*common law* (and *case law*), *equity*, and *statute law*—have flowed throughout the centuries, sometimes independently and sometimes in conjunction, to feed the waters of that great river which is the *English Legal System*.

B. THE SUBDIVISIONS OF ENGLISH LAW

I. CONSTITUTIONAL LAW

This is that part of the English Legal System which relates to four main branches of national administration:—

(a) *The Legislature*—*i.e.*, the *law-making* body known as Parliament.

(b) *The Executive*—*i.e.*, the *Government* and the functions of its various components.

(c) *The Judiciary*—*i.e.*, the *Judges*, their *Courts* and powers.

(d) *Local Government*—*i.e.*, the *Local Authorities* and their powers.

The two main principles of the Constitution are:—

1. The Supremacy of Parliament.—*I.e.*, there is nothing that Parliament cannot lawfully do, and there is no person or body of persons above Parliament. Its Acts cannot be unconstitutional, since it can itself modify the Constitution at will. Its Acts for the time being in force are the law of the land, and nobody can question their validity.

2. The Rule of Law.—This means that no person or body of persons is above the law of the land, and that there is one system of law, and one system alone, for everybody. This principle was reaffirmed by the Court of Appeal in the Enfield schools cases in August 1967—ministries and local councils must obey the law like everybody else. There is not in England, as there is in some other states, a special system of law and special courts for scrutinising the acts of ministers, civil servants, or other functionaries; such persons are bound by the same rules of conduct as other citizens. A complaint by a private citizen against a Secretary of State or a Commissioner of Police is investigated by the same courts, and under the same legal rules, as a complaint against another private citizen. Any apparent exception will be found to result from some special provision in an Act of Parliament itself. For example, the Army Act sets up a code of conduct for officers and soldiers, and does not apply to civilians; but that code is part of the Law of England because it is contained in an Act of Parliament—a code which (incidentally) remains valid only if it is confirmed by Parliament in every successive year. Again, the Emergency Powers (Defence) Act, 1939, conferred upon the Crown and its Ministers extensive powers, during the last War, to make Defence Regulations which should have the force of law; but the Act itself had to be passed by Parliament with the proper formalities. Such Regulations derive their legal and binding effect solely from the *powers delegated by Parliament*; and the High Court of Justice is competent to scrutinise, and frequently does scrutinise, the wording of the Regulations and the manner in which those powers are exercised, and to satisfy itself that the Minister concerned is not attempting to exceed the authority which Parliament has vested in him—in other words, to protect the citizen against the

arbitrary abuse of lawful powers and against their *unlawful enlargement. Delegated legislation* is always subject to such control; parliamentary legislation is not, since *nobody can question the validity of an Act of Parliament.* But the *interpretation* of any Act of Parliament—the ascertainment of its legal meaning and effect—is one of the proper functions of the Courts. By an Act of Parliament in 1966 an office new to the British Constitution was set up—that of Parliamentary Commissioner or Ombudsman (a name borrowed from a Scandinavian institution) to whom complaints of injustice by Government departments may be made.

II. CRIMINAL LAW

This is that part of the English Legal System which deals with the relations between the individual citizen and society as a whole. Thus, if A murders or robs B, the question of redress is not one merely for B or his family; the victim cannot, in a civilised community, be permitted "to take the law into his own hands," nor can it be left to him to decide what action should be taken against the offender—otherwise blood-feuds and public disorder would result. For that reason it has been the law for centuries past that, in the case of offences (1) against public order, (2) against the person and (3) against property, *the State (representing society as a whole) itself intervenes* and *prosecutes* the offender, for the purpose of upholding public order and vindicating the rule of law by inflicting *punishment* upon him—*not* for the purpose of *compensating* the injured party (which, as will be seen below, is the contrasting function of *Civil Law*). But the *programme* of Government legislation includes consideration of the payment of compensation for personal injuries to victims of violent crime (D42). Meanwhile, payments are *ex gratia*, within the discretion of the Criminal Injuries Compensation Board for an experimental period. For offences against public order, *see* D38.

The two main categories of Crime (as the Tables (D3, 43, 44) show) are:—

(a) *Grave (or Indictable) Offences*, which are dealt with at Assizes, the Central Criminal Court, and Quarter Sessions, and which carry severe penalties—death or lengthy sentences of imprisonment (death only for treason in time of war); and

(b) *Petty Offences*, which are dealt with in *Magistrates' Courts*, and are punishable by light sentences of imprisonment or by fines (with short sentences in the alternative). Examples of this latter class are (*e.g.*, under the Road Traffic Acts) driving without due care and attention, exceeding the speed-limit, causing an obstruction, etc. (*See also* Justices of the Peace, D37.)

Examples of (a) *Grave (or Indictable) Offences* are set out in the Table (D3) under the three main headings of:

(1) *Offences against Public Order*;

(2) *Offences against the Person*; and

(3) *Offences against Property*.

In connection with all these categories of offences the *Criminal Law* is concerned with the following general considerations:—

(a) Criminal Responsibility.—*I.e.*, the primary principle that every person is presumed (until the contrary is proved) to be sane, provided that his acts are *voluntary* (*i.e.*, *intentional*). It would, for example, be absurd for a man, accused of wounding another person by shooting, to plead that he did not intend, when he discharged the firearm at the other person, to do him any bodily harm. On the other hand, it would be outrageous to convict and punish a child of four who, without understanding the wrongfulness of his behaviour, picked up and took away some attractive and valuable object from a shop-counter; a lunatic who killed somebody under an insane delusion that the victim was a wild beast; a boy (like Oliver Twist) who was compelled, by force or violent threats, to break into a house, or a man who took an overcoat from a public cloak-room, honestly but mistakenly believing it to be his own. In none of these last illustrations is the act a *voluntary* one in the sense that there was the *intention to do something wrong*. To the rule that an act is not a crime unless it is intentional in this sense there are a few rare exceptions—cases where an Act of Parliament has expressly and clearly made some form of *conduct punishable in itself*, whether it was intentional or not; for example, during the War, permitting a light to be visible in black-out hours was punishable, even if it was unintentional and involuntary on the part of the accused. And see Sec. 8 of the Criminal Justice Act, 1967 (D41).

Intention must not be confused with *motive*. For example, in what has become known as "mercy-killing"—*i.e.*, taking the life of a person suffering from a painful and incurable disease—the killer is often actuated by a good *motive*—the desire to relieve hopeless suffering; but the *intention* is to kill, and the act is therefore a crime. (It is not necessary for the prosecution to prove any motive.)

The *burden of proof* in criminal cases is on the prosecution, *i.e.*, it is the duty of the prosecution to prove the accused guilty; not the duty of the accused to prove his innocence. The accused is presumed to be innocent unless and until his guilt is proved to the reasonable satisfaction of a jury. The jury are the sole judges of the true facts of the case, and their verdict had to be unanimous until recently; but by the Criminal Justice Act, 1967, it may now be by a majority of 10 to 2. The Act also contains a clause for major changes in committal proceedings by magistrates. See Secs. 2, 3, 9 of the 1967 Act (D41).

(*b*) **Unconsummated Crimes.**—*I.e.*, *attempts* to commit crimes which are frustrated by some outside event or by some person's intervention. For obvious reasons the *attempt* to commit a grave crime is *itself an offence* for which the offender can be prosecuted and, if convicted of the attempt, punished by fine or imprisonment. *Incitement*, by one person, of another to commit a crime, and *conspiracy* between two or more persons to commit a crime, are usually offences in themselves, whether the incitement or the conspiracy proves successful or not.

(*c*) **Joint Crimes** are those in which two or more persons take part. Such participation may arise in different ways. A *principal in the first degree* is the man who commits the actual offence with *guilty intention* (see (*a*) above), or who induces its commission by some other person who himself does not understand what he is doing. A *principal in the second degree* is one who *aids and abets* the guilty perpetrator at the time when the crime is committed. An *accessory before the fact* is one who *instigates* or *helps to prepare* the commission of the crime by another person, though not himself present when that other person commits it. In most cases of *grave crime* all these *three classes of participants* in a crime are *equally guilty*, and liable to the same punishment, provided that all of them shared the same *common criminal purpose*. (Thus, if two armed burglars break into a house, with their weapons drawn, and one of them shoots and kills the householder, both will be guilty of murder; while the accomplice who helped to plan the burglary will be equally guilty if the plan included the carrying of loaded weapons.) An *accessory after the fact* is one who, knowing that a *felony* (generally speaking, a grave crime involving *violence*) has been committed, shelters or receives one of the participators to enable him to elude justice. This latter kind of accessory is liable to prosecution, but the penalty in his case is less severe than that imposed upon any of the other three classes. (And see D42(1)).

(*d*) **Punishment and its Purpose.**—The purpose of punishment is fourfold:—

(i) *Retribution*—to demonstrate to the community in general that crime "does not pay" and thus to uphold the rule of law and to prevent the deterioration of public morals;

(ii) *Prevention*—to restrain offenders, so far as possible, from repeating their crimes by keeping them in custody;

(iii) *Reformation*—to make them, so far as possible, better citizens by means of moral and ethical training—teaching them to "go straight"; and

(iv) *Deterrence*—to inspire among offenders and would-be offenders a fear of and a healthy respect for the law and the strength of society as a whole, which it protects.

There has been much controversy on the relative importance of these four functions of punishment. During the past half-century, *reformation* of the offender, whenever possible, has become a paramount aim.

The Murder (Abolition of Death Penalty) Act, 1965, provides that no person shall suffer death for murder; a person convicted of murder shall be sentenced to imprisonment for life. In passing sentence the Court may declare the minimum period which it recommends the Home Secretary to allow to elapse before he orders the murderer's release on licence. The new Act is to continue in force until 31 July 1970, and then expire unless both Houses of Parliament pass contrary resolutions; if the new Act does expire, the law as it existed before the passing of the new Act shall again come into operation.

III. STATUS

A person's *Status*—*i.e.*, his legal position in society—affects his legal rights and duties in most civil matters and, in some few cases, in criminal matters too (see *Criminal Responsibility*, D6).

1. Nationality, in this connection, means British Nationality under the British Nationality Acts, the latest of which was passed in 1965. By the 1948 Act the term "Commonwealth Citizen" was created which can be used as an alternative to British Subject. A person may be a British subject by birth, by naturalisation, by marriage, or by registration, though under the Act of 1948 a woman who was not a British subject before marriage does not automatically acquire British nationality merely by reason of her marriage to a British subject. The law and the courts of this country can determine whether a person is a *British subject* or an *alien*; they cannot determine whether or not he is a citizen of some particular *foreign state*, since that is a matter for the law of the foreign state concerned. Generally speaking, in times of peace, an *alien* in this country has the same rights and duties as a British subject, except that an *alien* has *no right to vote* in parliamentary or municipal elections, and that some professions (*e.g.*, that of a solicitor) are closed to him. By the Act of 1964, a person who is *stateless* may apply to be registered as a citizen of the U.K. and Colonies if either parent was such a citizen when he was born, or if the place of his birth is within the U.K. and Colonies at the time of his application. By the Act of 1965 *alien wives* of those British subjects who are *not citizens of any Commonwealth country* may be *registered* as British subjects.

2. Domicil means the country where a person has his *permanent home* without any present intention of changing it. His *domicil of origin* is that of his parents while he is an infant; at the age of majority he is free to acquire a new domicil by making his permanent home elsewhere. Domicil is of particular importance in matters of—

3. Marriage and Divorce.—English law generally regards as valid a *marriage ceremony* carried out in this country after the proper preliminaries and with the proper formalities, whatever the nationality or domicil of the parties. English law also accepts the validity of a *marriage ceremony* which has been carried out abroad according to the law of the country where it took place. But if one party or the other has an *English domicil*, the *status of the marriage as an institution* must depend on English law, whether the *ceremony* was in proper form or not. For example, a man who has his permanent home in England cannot evade the English rule against consanguinity by going through a *ceremony* of marriage, in Ruritania, with his mother's sister—even if such a marriage is lawful by Ruritanian law, and even if the ceremony has been carried out with the usual Ruritanian formalities, it is still *null and void* by the law of England. The English court will *not*, generally speaking, grant a *divorce* to a man who is *domiciled abroad*, since the law of the country which is his permanent home may not recognise this divorce, or perhaps any divorce, as valid; and it is improper that he should be regarded as a single man in England and a married man in his homeland. Similarly, English law *will* generally recognise the validity of a divorce granted by the proper court of his domicil (*i.e.*, of the state where he had his permanent home at the time) or of a divorce which the law of his domicil regards as valid, even if it was granted by a court elsewhere—and that whether he is a British subject or not. But a person, whatever his nationality, whose permanent home is in England will not be regarded here as validly divorced merely because he has spent a few weeks in Barataria, where divorce procedure is simple, and has been granted a decree there. His *status*—married or single—generally *depends on the law of his domicil*—*i.e.*, the law of the country which is his permanent home. (*See also* D24–33.)

4. Infancy is the status of a person under the age of majority (at present twenty-one). An *infant cannot vote at elections*; he *cannot hold freehold or leasehold property*, and *he cannot be made bankrupt*. (In exceptional cases where the debt is for "necessaries" (D10(1)), a bankruptcy notice may be issued against an infant.) If he enters into certain kinds of *contracts* during his infancy he *can repudiate* them, if he so desires, up to a reasonable time after his twenty-first birthday. He *cannot make a valid will*, and his rights under another person's will or settlement cannot be compromised or altered without the leave of the High Court. An infant *cannot make a valid marriage without consent* of his parent or guardian, or of the appropriate court. His rights are at all times the special care of the Chancery Division of the High Court, which will protect those rights according to the Rules of Equity (*see* D5.) (The Latey Committee has recommended reducing the age of majority to eighteen).

5. Lunacy, in the broad legal sense, is the status of a person who is "incapable, by reason of unsoundness of mind, of managing his affairs." "Lunacy" in this sense is not necessarily identical with any of the mental conditions to which such psychological terms as "insanity," "imbecility," "idiocy," and the like are applied; there need be no actual mental *disease*. When a person becomes incapable, for this reason, of managing his affairs, the law, in order to protect both him and society at large, *changes his status* by putting the custody of his person, or the control of his property, or both, into reliable hands. Such matters come under the supervision of the Chancery Division, since one of the functions of Equity (see above) is to protect those who cannot help themselves. Certification of "insanity" (in the psychological sense) is not necessary; but with the proper medical certificate and legal safeguards the *patient* (as he must be called) may be removed to a mental hospital. Some reliable person (usually a near relative) may be appointed, by an Order of the *Court of Protection* (a branch of the Chancery Division), as *Receiver* of his property. The Receiver's duties are to look after the property and income of the patient, pay his debts and defray the expenses of his maintenance and medical care, and generally to deal with the patient's property on the patient's behalf. Periodical accounts must be submitted to the Court, which will scrutinise them strictly and at once intervene if there appears to be any irregularity on the part of the Receiver. If there is no relative to take the responsibility, the *Official Solicitor* at the Royal Courts of Justice will be appointed as Receiver, with the same duties and liabilities.

Apart from these matters of administration, a person of unsound mind is regarded as incapable of making a valid will, of entering into a legal agreement, or of dealing with his property. None of these transactions is valid unless the person concerned *understood the nature and effect* of what he was doing; and whether he did understand or not is a question of *evidence* in every individual case: medical and other witnesses must testify to his conduct and demeanour at the time when he entered into the transaction in question. If the Court comes to the conclusion that he was unable to understand the nature and effect of the transaction, the Court will *rescind—i.e.*, set aside or cancel—the transaction, even though it was in proper legal form.

If a person does an act which, if *voluntary or intentional*, would constitute a *crime* (see *Criminal Responsibility*, D6), and his legal advisers put forward a defence of insanity, the general rule is stricter: he can still be convicted unless he can prove, to the satisfaction of a jury, that he was "suffering from such a *defect of reason*, due to *disease of the mind*, as not to know the *nature and quality of the act* he was doing, or (if he *did* know this) not to know that what he was doing was *wrong*." Medical men, psychologists, and social reformers have long regarded this rule (which has been in force since 1843) as too severe. It was a rule applicable to *all crimes*; but the controversy became associated in the public mind chiefly with *murder*. As a result of a long period of agitation and discussion the rule was amended by section 2 of the Homicide Act, 1957; but *only in its application to murder cases*. It is now provided that "a person who kills (or is a party to the killing of) another shall *not* be convicted of *murder* if he was suffering from such *abnormality of mind* as substantially *impaired his mental responsibility* for his acts and omissions in doing, or being a party to, the killing." (It does not matter whether the "abnormality of mind" arises from "a condition of arrested or retarded development of mind," or from "any inherent causes," or is "induced by disease or injury.") The Act goes on to provide that a person who, under the old law, would have been convicted of murder shall instead be liable to be convicted of *manslaughter*.

In other crimes, where the accused person is clearly proved to have been insane at the time the crime was committed, the verdict is now "Not guilty by reason of insanity."

6. Bankruptcy is the creation of Statute Law—there was no common law of bankruptcy. It is the status of a person (the "debtor") who is *insolvent—i.e.*, who is unable to pay his debts (exceeding £50) as they fall due. By the appropriate procedure the State takes the management of the debtor's property out of his hands and places it in the hands of the *Official Receiver*, whose duty it is to realise it and (subject to certain privileged claims) to distribute it *proportionately among his creditors*. The procedure is that one of the creditors files at the Bankruptcy Court a *bankruptcy petition*, on which the Court may make a *receiving order*, which has the effect of *transferring the legal management* of the debtor's property to the Official Receiver. That official investigates the debtor's finances and draws up an account, called a *statement of affairs*, showing the debtor's liabilities and assets. There is a *meeting of creditors* and a *public examination* of the debtor in Court, as a result of which the Court may either *discharge the receiving order* (on the debtor's showing that he can pay his debts, if he is given time, or persuade the general body of creditors to accept his proposals for a *composition* of so much in the £), or the Court may *adjudicate* the debtor a bankrupt. In the latter case it is open to the creditors either to leave the management of the debtor's property in the Official Receiver's hands or themselves to appoint a *trustee in bankruptcy* (usually an accountant) nominated by some or all of them, and that trustee takes over the management of the debtor's affairs. The debtor is bound, under penalty, to give *full information* about his affairs to the Official Receiver and the trustee in bankruptcy; he cannot, while he is a bankrupt, sit or vote in Parliament or act as a Justice of the Peace or in certain other offices. He will be committing an *offence* if he conceals any property or debt or falsifies his books of account, if he obtains property on credit or secures credit of £10 or more without disclosing his status, if he trades without such disclosure or fails to keep proper books of account, or if he leaves or attempts to leave the country, taking with him property, worth £20 or more, which ought to be divided among his creditors. It is also an offence for him to transfer property with intent to defraud any creditor, and any such transaction may be set aside by the Court.

7. A Corporation or Incorporated Body is an association of persons recognised by *Act of Parliament*, or by its *Charter*, as *one single legal entity*. It may be a *chartered* or a *statutory corporation* (*e.g.*, the British Broadcasting Corporation or the London Transport Executive), a *local authority* (*e.g.*, the Greater London Council or the Westminster City Council), or a *company* incorporated under the Companies Act, 1948, or one of the earlier Companies Acts. Generally speaking, a corporation of any kind has power only to do such things as it is given power to do by its Charter or by the Act of Parliament under which it was constituted; if it goes beyond that power it is behaving *ultra vires*—"beyond its powers"—and such acts on its part will be regarded by the Courts as null and void. The Court may also restrain the corporation by *injunction*—an Order forbidding it to act in such a manner. (For *companies*, see below).

Every corporation, being a single legal entity, is a legal *person* distinct from the individuals who are its members. Thus the *corporation itself* can take *proceedings*, or have proceedings brought against it, in the Civil Courts, and it may itself be *prosecuted* in the Criminal Courts, if it commits an offence, and be liable to a fine. No personal liability rests upon its individual members, directors, or officers unless they have personally done something unlawful or aided and abetted the corporation in its wrongdoing. The corporation itself can *enter into a legal agreement* with one or more of its members or a member of the public, and any person injured by its acts can enforce his legal rights against the property or assets of the corporation, which are distinct from the property or assets of the individuals who compose it.

A *company* is usually a commercial concern and generally takes advantage of the principle of *limited liability*, in which case the last word in its name must be the word "Limited." The principle is that, in the event of the company's becoming *insolvent*, none of its members can be compelled to contribute to its funds a larger sum than the sum which he agreed to pay for his *shares*, however large the indebtedness of the company itself. Every company must file at the Companies Registry a *Memorandum of Association*, setting out its *name*, the situation of its *registered office*, its *objects* (beyond which it has no power to act), its *capital*, and whether or not it is *limited*. It should also file its *Articles of Association*, setting out its *rules of management*, the method of issuing, allotting, and transferring its *shares*, the procedure for *meetings*, the powers and duties of its *directors* and other officers, and similar matters. If and when its objects have been *fully achieved*, or if it is desired to *discontinue its activities*, or if it becomes *insolvent*, it will be *wound up* and *dissolved*. The winding-up is undertaken by a *Liquidator* whose duties are similar to those of the trustee in bankruptcy (described above under *Bankruptcy*). The liquidator may be nominated by the members of the company or, in case of the company's insolvency, by some or all of the creditors, and the liquidator's appointment must be confirmed at a special meeting. If the winding-up of an insolvent company takes more than a year the liquidator must report annually to the *Board of Trade*, the Government Department which watches the interests of the persons concerned.

8. Adoption. *See* D34.

IV. The CIVIL LAW or LAW OF PERSONS

This deals with the relations between *one individual citizen and another*, and their mutual rights and duties. If A makes a business agreement with B, and breaks it, or if A walks without permission across B's field of new-mown hay, B will be able to secure *redress* against A by proceedings in a court of law. But in neither case is it necessary for the State to intervene, by way of prosecution, to punish A for what he has done, since no offence against society at large, and no violation of public order, or the rule of law, has arisen. The issue is one merely between A and B: B may choose to ignore the wrong done to him, or he may negotiate amicably with A for the payment of compensation or, if this fails, he may *as plaintiff sue A as defendant* in a *civil action* for *damages*. Unlike a criminal prosecution, undertaken by the State for the preservation of public order and vindication of the rule of law, with a view to punishing the offender, the *civil action* will be brought, if B so chooses, *by B himself* for the purpose of recovering *compensation* in money for the harm he has suffered and (in some cases) of obtaining an *injunction*—a Court Order prohibiting A from continuing his wrongful conduct. Again, a criminal prosecution will not be discontinued even at the request of the injured party, since the State itself is interested to see justice done; but a *civil action* can be *discontinued* by B at whatever stage he desires, with or without an agreement for the payment of *damages* in compensation.

These *relations between one individual and another*, interference with which may give rise to a *civil action for damages or injunction*, may arise in two alternative ways:—from the acts of the parties themselves, or from the operation of law. Hitherto *evidence of a criminal conviction* has *not been admitted in Civil cases* (D43). The Law Commission (D5(2)) has now recommended *abolition* of this rule. *The onus* of proving that the conviction was wrong lies on the accused. The same is to apply to findings of *adultery in divorce cases*, and of *paternity in* affiliation cases.

1. Law of Contract

The relations between individuals which arise from the acts of the parties themselves are usually brought about by a *contract*—*i.e.*, by an agreement between them. A contract may be (a) *expressed in words*, as where A agrees to buy B's motor-car for £400, on certain stated conditions, or (b) *implied by conduct*, as where A calls a taxi and tells the driver to take him to a certain address. (*a*) In the former case, particularly if the contract is put into writing, the parties will normally have *expressed* all the necessary terms and conditions. (*b*) In the latter case it is *implied* by A's conduct, and understood by law and custom, that A will be expected to pay, at the end of the journey, the amount of the fare recorded by the taximeter: it is not necessary for the driver to stipulate those terms in advance. Everybody, several times in the course of each day, enters into an *implied contract* of this kind—when he steps on an omnibus to go to his work, when he orders a meal in a restaurant, when he tells the grocer to deliver goods to his house, and so on.

Simple Contracts and Deeds

(1) **A Simple Contract** is a contract *expressed in words* (whether in writing or not) without the formalities of a *deed* (see below), or a contract *implied by conduct*. There is no legal contract (*a*) unless there is *complete certainty* on the terms; (*b*) unless the basis of the agreement is lawful; and (*c*) unless both parties are *legally capable* of entering into it (see above, *Status*), and (*d*) in *complete agreement* on their intentions. And the agreement is not enforceable (*e*) unless there is some *consideration*, *i.e.*, some *quid pro quo*, expressed or implied, on either side. (The Law Commission (D5–3), however, is considering the abolition of *consideration* as essential to every contract). Thus (*a*) a promise by A that he will buy B's motor-car cannot be enforced by either side unless the price is mentioned, nor (*b*) if the car has been stolen by B, nor (*c*) if A is of unsound mind, nor (*d*) if B owns two cars, and A is thinking of the Ford, while B intends to sell the Austin. Again (*e*) a promise by C, during the course of the year's work, that he will give his employee, D, a Christmas box of £5 is not enforceable by D unless *he* has made a promise, or done something in return. If C tells D that he will give D the £5 at Christmas *on condition that* D puts in certain *extra time* over and above his normal working-hours, and D complies or promises to comply, that compliance, or promise of compliance, will be sufficient *consideration* to turn A's promise into an enforceable contract. There need be nothing at all in writing, except in a few cases laid down by law; in all other cases the only *value of a written agreement*, signed by both parties, is that it provides clear *evidence* of the terms that were agreed. A written contract requires a sixpenny revenue stamp if it is to be produced as evidence in a court of law. (The Law Commission is recommending a code to cover the whole law of contract).

(2) **A Deed** (broadly speaking) is a contract or other written document, *signed, sealed*, and *delivered* by the parties. The formalities of *affixing one's seal* to a legal document, and pronouncing the formula, "I deliver this as my act and deed," have emphasised the significance and solemnity of certain important transactions for many centuries past; and even persons who were unable to write their names were capable of carrying out the formalities of *sealing* and *delivery*. The legal requirement that deeds should also be *signed* was imposed only in 1925, by section 73 (1) of the Law of Property Act. The chief practical distinction between a simple contract and a deed is that a *deed requires no consideration* to make it enforceable. The special formalities which constitute the *execution* of a deed (*i.e.*, signing, sealing, and delivery) take the place of that moral obligation which (in a simple contract) the common law required to be satisfied by consideration on the part of the person to whom the promise was made. For this reason a *deed* is required in a case where A makes a promise to B which he desires to render enforceable without any corresponding promise by B to A, and also in a case where A desires to make to B a *gift of property* of such a nature that it cannot be physically handed over. This second case arises particularly where the subject of the gift is *land or buildings*; in fact, by a provision of the Law of Property Act, 1925, a *deed* is always necessary to *transfer the ownership* of any *freehold or leasehold* property, and also to grant a *tenancy* for a term of *more than three years*. The transfer of a *legal right* of some kind (*e.g.*, a share in a company or the claim to moneys under an insurance policy) is generally effected *by deed*.

In connection with the Law of Contract the following subsidiary matters must be considered:—

Subsidiary Matters

(a) **Capacity of Parties.**—The question whether a party to a contract is *legally capable* of entering into it. This question usually depends on that party's *status* (see above):—

(1) *Nationality.*—Nothing turns on this, except that *no commercial contract* can be made with an *alien enemy* in time of war.

(2) *Domicil.*—Where the two or more parties to a contract have their *permanent homes in different countries* it is a wise precaution for them to state, in the contract, under which country's law and by which country's courts, in case of a dispute, its terms are to be construed. If they omit to do so, and some dispute is brought before the English Court, it will endeavour to decide, by considering the wording of the contract, the language in which it is written, the domicil of the parties, and the general circumstances in which the contract was made, what legal system the parties intended to apply and by what court they intended is to be judged. Sometimes it will decide the dispute according to the rules of the foreign law.

(3) *Marriage and Divorce.*—There is now no practical difference in contractual capacity between single persons, married persons, and divorcees.

(4) *Infancy.*—It is not (generally speaking) impossible for a minor (at present under twenty-one) to enter into a valid contract, but he will be

entitled to repudiate it at any time up to the date of his majority (or a reasonable period after that) *unless* the contract is (*a*) clearly for the *infant's benefit* on the whole (*e.g.*, professional articles or an agreement for apprenticeship), or (*b*) for the provision of *necessaries*—*i.e.*, food, drink, clothing, or services which are necessary to the infant in his particular station in life. (The origin of this latter rule is probably the practical consideration that, in earlier times, few people would have taken the risk of providing an infant, on credit, with the bare necessities of life if they had been precluded from suing him for reasonable payment.)

(5) *Lunacy.*—A party to a "contract" who knows that the other party is of unsound mind will not be permitted to hold the latter to his bargain. *See* D8(1).

(6) *Bankruptcy.*—A bankrupt cannot make a valid agreement to deal with his property in a manner which contravenes the law of Bankruptcy (see above, under *Status*, D8).

(7) *Corporations.*—Whether a corporation is capable of entering into a particular contract depends upon the legal powers conferred by the Charter or Act of Parliament under which it was constituted, or (if a company) by its Memorandum of Association (see above, *Status*, D8). If the matter to which the contract relates is of grave importance it will usually signify its adherence to the contract by *affixing its seal* with the formalities laid down by its Rules or Articles of Association. If it is an everyday or trivial matter the corporation will normally enter into a contract through some agent (*e.g.*, its Town Clerk, Director, or Secretary, as the case may be) who is empowered to sign or speak on its behalf (*see* Agency, D11).

(*b*) **When Writing is Necessary.**—There are certain exceptions, laid down by Act of Parliament, to the rule (*see* D9–2) that a contract is enforceable even if made only by word of mouth or implied by conduct. The Statute of Frauds, 1677, provided that contracts of these exceptional kinds cannot be enforced by action in the Courts "unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing, and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorised"—these last words mean an *agent* (*see* Agency, D11). It is *not necessary* that the *whole of the agreement* shall be formally set down in *writing*; but there must be a *written and signed record* of all the *essential terms*.

(i) *A Guarantee.*—*I.e.*, a promise by A to B in the form—"Please lend money (or supply goods) to C, and if C does not pay you I will." A's promise by word of mouth cannot be enforced against him.

The provision of the Statute of Frauds still holds good.

(ii) An *agreement* for the *sale or disposition of land* (*or buildings*) or of any interest in land (or buildings). We have already stated that the actual *transfer* of a *freehold or leasehold* interest must be effected by *deed* (*see* Deeds, D9). This is not the same as an *agreement to sell or dispose of* land or buildings; a *transfer* effects an *immediate change of ownership*, while an *agreement to sell* binds the party who signs it to make a transfer of ownership at some *future time*. Such an agreement need not be in the form of a deed, but its *essential terms* must be *in writing*.

Some other parts of the Statute of Frauds have been repealed: that contained in (ii) above has been replaced by a similar provision set out in section 40 of the Law of Property Act, 1925.

(iii) A *bill of exchange* or *promissory note* must be in writing, by virtue of section 3 of the Bills of Exchange Act, 1882.

(iv) A contract of *Marine Insurance* is inadmissible in evidence unless it is embodied in marine policy as laid down in the Marine Insurance Act, 1906, sections 22–24, with all relevant conditions fully specified, and duly signed by or on behalf of the insurer.

(v) By the Contracts of Employment Act, 1963 (in force since July 1964), it is the *duty of an employer* (not later than 13 weeks after the employment commenced) to hand his employee a *written statement of particulars of the employment* (period, wage, working hours, and what length of notice is required for termination).

(*c*) **Mistake.**—Suppose that John Brown wants his portrait painted by a famous artist called William Brush, of whom he has heard but whom he has never met. He looks up "William Brush" in the directory and writes to him, at the address shown, offering him 100 guineas to paint the portrait. Suppose that particular "William Brush" is not the artist at all but a stockbroker of the same name. Even if that William Brush accepts Brown's offer, their apparent agreement will not constitute a valid contract, since Brown's *mistake* as to Brush's identity is so *fundamental* that it *destroys the very basis* of the agreement. Where there is a mistake of this kind, "going to the very root of the agreement," no valid contract has, in the eyes of the law, been made. In other special cases *equity* (*see* D(42)) may, on the ground of *conscience*, *relieve* one or both parties from liability under a concluded contract by *rectification* (*i.e.*, by correcting the terms they have inadvertently recorded) or by *rescission* (*i.e.*, by cancellation of the contract). It is not every mistake that will lead to these results; either the mistake must have been *fundamental* or the circumstances must have been such that it would be *unconscientious* for one party or the other to try to enforce his apparent rights.

(*d*) **Misrepresentation.**—Equity, on similar grounds, will often relieve a party from liability under a contract into which he has been induced to enter through a *representation* by the other party which is *substantially false*—*i.e.*, a statement which is misleading on some essential point. If it turns out that the *misrepresentation was deliberate*, the deceived party may in addition be entitled to claim *damages for fraud*. Whether the misrepresentation was *deliberate or innocent*, the deceived party will usually be able to have the contract *set aside*—*i.e.*, cancelled. (But see Misrepresentation Act, 1967 (D41)).

Suppose, for example, Jones wants to insure his life with the Markshire Insurance Company. Before issuing the policy, which is the contract between them, the Company will ask Jones—"Have you ever suffered from any serious illness?" Suppose Jones says "No," though he did in fact suffer from tuberculosis five years ago. Even if the policy contains a promise by the Company to pay Jones's widow £5000 upon Jones's death, the Company will be entitled to refuse to pay when that event happens; it has been induced to enter into the contract through Jones's misrepresentation.

(*e*) **Duress** means compulsion by *threats or force*. If a man has been compelled in this manner to put his name to a contract it is *voidable by him* at any time—*i.e.*, *he may repudiate* it on the ground of duress, and will be upheld by law in doing so. *Undue influence* means influence exerted by A upon B to such an extent that B could not have exercised any free and independent will in doing a particular act. Equity has always been jealous to protect certain classes of persons from this kind of influence; it goes so far as to *presume* that there has been undue influence where a guardian has got some benefit out of his ward, a parent from his child who is under (or only just over) majority, a doctor from his patient, a solicitor from his client, or a priest from his parishioner. In most of such cases the onus is upon the person in the influential position, who has obtained the benefit, to prove that there was no undue influence; it is not for the other person to prove that his mind was wrongfully influenced by the former.

(*f*) Illegality of contract arises where the parties have agreed to do an act (i) forbidden by law or (ii) contrary to "public policy." (i) The former includes not only an agreement to commit a crime, but also an agreement to do an act which might be harmful to a third party and give him a right of action for breach of contract or tort. The courts will obviously not lend their assistance to a plaintiff who complains that the defendant has refused to honour his agreement to do something unlawful, whether (for example) the agreement was to burgle a house or merely to write a libellous article about another person. (ii) Even if the act agreed upon was not actually unlawful, the courts will refuse to enforce the agreement if it was to do something which is regarded as harmful to the community. It is not, for example, a crime for a man and a woman to live together without being married, nor is it even "unlawful" in the civil sense that such a way of life gives the one a right of action against the other; but no court would enforce an agreement by a woman to become a man's mistress, nor an agreement by the man to maintain her in return.

(*g*) Breach of Contract occurs when one of the parties breaks his promise and neglects or refuses to perform his duty under the contract. Breach by one party entitles the other party to sue for *damages*, the amount of which is usually assessed so as to compensate the latter for the *actual loss* he has suffered ("special damage"). In certain cases the court may award *general damages* in addition—*e.g.*, in an action for breach of promise of marriage the jilted woman may be awarded *general damages* for the distress she has suffered, her loss of reputation, etc., as well as *special damages* to cover the amount by which she is *out-of-pocket* by reason of giving up her employment, buying a trousseau, etc.

(1) *Damages* have always been the *common-law remedy* for breach of contract. In special cases, however, equity may grant two other remedies in addition to, or in substitution for, damages; but only where equity regards damages as an insufficient compensation. These additional remedies are:—

(2) *Specific Performance.*—*I.e.*, an order, to the party in breach, *actually to carry out* what he contracted to do. In practice this remedy is confined to: (i) contracts for the sale or letting of *land or buildings*, and (ii) contracts for the sale of some *article of a special nature* which cannot be replaced by spending money in the open market—for example, the sale of an original painting by Rembrandt. The remedy of *specific performance* is *never* granted to enforce a contract for *personal services*, since it would be impossible for the court to supervise the carrying out of such a contract.

(3) *Injunction.*—*I.e.*, an order by the court to the party in default *prohibiting him* from carrying out some positive act which would constitute a breach of contract. For example, where a singer has entered into a contract to work, for a certain period, only under the management of one particular impresario and no other, the court may order the singer not to offer or engage her services elsewhere during that period. Disobedience to an injunction constitutes *contempt of court*, and is punishable by fine or imprisonment.

Agency

(1) The Status of an Agent.—An *agent* is a person, who, being duly authorised, *acts on behalf of another person* who is called the *principal*. An agent is not the servant or employee of his principal. The principal tells his agent what transactions he wishes the agent to carry out, but does not exercise the control and supervision that a master exercises over his servant. Thus, for example, a solicitor is the *agent* of the client who has instructed him to attend to the purchase of a house; once instructions have been given it is left to the solicitor to carry out the work in his own way, as his skill and knowledge dictate. But the solicitor's clerk is the solicitor's *servant*; he is told what letters to write, what documents to prepare, what inquiries to make, and so forth. The two functions may sometimes appear to overlap; but the essence of agency is that there must be a *third party* with whom the principal is to be brought into relations; "the agent is the conduit-pipe connecting the principal and the third party." The agent is therefore debarred from acting for his *own benefit* without the principal's knowledge and consent.

Generally speaking, any person may do through an agent whatever he has power to do himself, except such transactions as depend upon some *personal qualification* peculiar to his own trade or profession. Thus, a man whose business is to sell or buy ordinary commercial articles can properly leave such business to an agent to perform; but an engineer, a lawyer, or a surgeon cannot entrust an agent with work that requires the exercise of *personal qualifications*, calling for special training and skill.

(2) The Contract of Agency.—Agency is brought about by *contract*—an agreement in writing, by word of mouth, or even one that may be implied from the conduct of the parties. No formal words are necessary: a request to an estate-agent to find a purchaser for your house will make him your agent for that purpose; if you ask a dealer to obtain for you a rare book or a Sheraton table, he is a purchasing agent on your behalf. The *terms* of the contract between the principal and the agent may be agreed upon in detail between them, or may depend upon the *usage* or general practice in the particular trade or profession. The parties are generally at liberty to agree upon whatever terms they please; in commercial agencies it is always desirable to set down in writing, for record purposes, the period for which the agency is to last, the area and scope of the agent's duties, his method of remuneration (usually by *commission*, at so much *per cent.* of the value of business he does), the prices at which he is empowered to sell or buy, and whether he is to be entitled to commission on sales to customers, or purchases from vendors, not introduced by him but carrying on business within his area.

In agencies of a special kind—where, for instance, a solicitor is instructed—his charges are regulated by a professional scale laid down by law; an estate-agent usually stipulates for payment of his commission on the recognised scale. Where no rate of remuneration has been agreed or implied, and after the work is done the parties cannot come to terms, the question must be decided by a court or arbitrator on the basis of *quantum meruit*—that is to say, an estimate of the *reasonable value* of his work.

(3) Rights and Duties of Principal and Agent.—These depend on the terms agreed between them; but if (as frequently happens) these terms are not on record, or are incomplete, certain legal principles apply. The first is that the relationship is one of *mutual trust*. The principal must do nothing to hinder the agent in earning his due; if he appoints a "sole agent," he must not entrust the transaction to other hands. If he does, he will have to pay the sole agent also. He must reimburse the agent for all expenses and losses properly incurred in doing what he was authorised to do. The agent must act honestly and loyally towards his principal; he must not make a secret commission or profit for himself, over and above what has been agreed; he must use proper skill and care, according to his qualifications, in his principal's business; he must keep proper accounts and pay over to his principal the money from time to time collected on the latter's behalf. If he has a *personal interest* in any transaction, he is bound to make *full disclosure*. The law will not tolerate any conduct which brings about a conflict between the agent's duty to his principal and his own *personal advantage*. The agent is therefore failing in his duty if, unknown to his principal, he buys the principal's property for himself, or sells his own property to the principal.

(4) **The Principal and Third Parties.**—So long as the agent has acted within the *scope* of his agency, the principal is bound by any authorised act done or agreement made between the agent and other parties. And even where the act was unauthorised, the principal is bound if he has, by words or conduct, led others to believe that the agent was authorised to do it. If the agent does something outside the scope of his agency—an act which no third party would reasonably expect the agent to have power to do—the principal is not legally bound towards the third party. These rules apply also to cases where the agent has received money or property from a third party on his principal's behalf, but fails to hand it over to him. The principal cannot claim payment over again from the third party unless the latter ought clearly to have known that the agent was not authorised to receive it. In other words, only contracts entered into and payments made by or to the agent in the *ordinary course of his business* are enforcable by and against the principal and third parties.

In cases of master and servant, similar rules apply where the servant, in the ordinary course of his business, injures some third party by a wrongful act; the servant is liable in damages, and the master also if the act (which turns out to be wrongful) was done within the *apparent scope* of the service. So, if one of the servant's ordinary duties is to deliver goods on his master's behalf by van, and while he is doing so he runs over a pedestrian through his own careless driving, the master as well as the servant will be liable to pay damages for the injury.

But the principal cannot be *prosecuted and punished*, by fine or imprisonment, for an agent's *crime* unless the principal himself authorised or took part in it.

(5) **The Agent and Third Parties.**—If the agent makes a contract *without disclosing* that he is merely *acting as agent*, he is *personally* liable to the other party to the contract, even though he intended to act on his principal's behalf. If he discloses that he is acting merely as an agent, but does not disclose his *principal's name*, he (the agent) will not usually be personally liable. If the contract is in writing, he can safeguard himself by signing it "as agent," "on account of," "on behalf of," or "for" a named person.

If, on the other hand, the agent gives a third party to understand that he is acting for a certain principal but has *in fact* no authority to act for him, and if the principal later refuses to accept liability, the agent is liable to the third party for his false statement or pretence. This is known as *breach of warranty*—that is, he "warranted" or guaranteed that he had authority to bind his principal, but has broken his warranty; having thus left the third party without right of redress against the principal, the agent must bear the liability himself. (The Law Commission (D5(2)) is recommending improvements in third parties' rights).

2. Law of Tort

This branch of the law deals with the relations, between one individual citizen and another, which arise from the operation of the law itself, without the necessity for the parties to do any act to put them into legal relations with one another. As was pointed out above (D9(1)), if A and B are to be linked in a contractual relationship, each of them must take some step to bring that relationship about. No such step, however, is necessary in connection with the matters dealt with by the Law of Tort. Everybody has a right to expect that his person and his property shall be inviolable by other private citizens; he also has a right to expect others to refrain from attacks upon his character and his business reputation. These rights do not arise from any agreement or other act on his part, but from the general principles of the law.

A *tort* is the violation of such a right, which entitles the injured party to bring a *civil action* for damages to *compensate* for the injury he has suffered. The word *tort* (in French "wrong") is derived from the Latin *tortus* meaning "twisted" or "distorted."

It will be seen from the Table (D8) that some torts (*e.g.*, assault) may also be crimes—that is, they may entitle the injured party *either* to bring a *civil action* for *damages* or to *prosecute* the offending party and have him *punished* by a *criminal* court in cases where the offending party's action is liable to harm the community at large; a personal assault, for example, may lead in some circumstances to general disorder, and in that event it will become a matter for intervention by the State through the criminal courts (*see* **D44**). This section, however, deals only with the *civil remedies* which, as in breaches of contract, are primarily *damages* and sometimes *injunction* (*see* **D11(1)**).

The main headings under which torts may be committed are shown in the Table.

Trespass is a wrongful act committed by one citizen, against the will of another citizen, either against the latter's person or in disturbance of his possession of land or other property.

(1) **Trespass against the Person** may be by way of *assault*, *battery*, or *false imprisonment*. An *assault* is an attempt to do violence to the person of another; if the act is fully consummated it becomes a *battery*. Thus it is an *assault* for one man to shake his fist in the face of another, or to adopt a threatening attitude towards another, or deliberately to set his dog on another person. If the first person actually strikes the other person, or if the dog, encouraged by the first person, actually bites or harms the other person, that is a *battery*. In order to constitute an assault or battery, and to render the trespasser liable to an action for damages, his act must be *deliberate*. It is not assault and battery if A *accidentally* knocks against B in a crowd, with the result that B falls and is injured. The act by the trespasser must also be *against the will* of the person injured. Thus an operation performed by a surgeon, though it may seriously affect the body of the other person, is not an assault or battery if the other person has consented to the operation; but such an operation, performed without the other person's consent, may amount to an assault or battery.

Certain acts which would in the ordinary way constitute assault or battery are excusable; it is recognised, for example, by the common law, that a parent or a teacher has the right to inflict reasonable chastisement upon a child or pupil in his care, and provided that the chastisement is not excessive the child or pupil has no right of action. If, however, the chastisement results in serious injury or amounts to brutal violence, then the person inflicting it will be liable to an action for damages. (The present Government is considering abolition of corporal punishment in schools.)

False imprisonment means the *unlawful restraint* of one person by another. It need not amount to actually locking up a person in a room; it is sufficient if his freedom of movement is *totally restrained* either by confinement or by the use of force or threat of force. It should be noted that the restraint must be unlawful; it is not, for example, unlawful for a police officer to arrest a person engaged in committing a crime, or a person whom the officer has reasonable grounds for suspecting of committing, or being about to commit, a violent crime. Even a private citizen may lawfully arrest a person who has actually committed a violent crime or whose behaviour has led to a breach of the peace (*see* **D39–40**).

The tort of *malicious prosecution* is committed by a person who makes a *criminal charge* against another person where the proceedings terminate in the acquittal of the latter, where the first person was actuated by spite or ill-will, where there was no reasonable or proper cause for the proceedings, and where the second person has suffered damage as a result. The essence of the tort is *malice* on the part of the person who

brought the criminal charge; it is not sufficient that he was honestly mistaken.

(2) **Trespass to Land** arises whenever one person *enters unlawfully* upon land or a building in the possession of another person. Two important points should be noted, as several popular fallacies exist about this tort. First, trespass to land is not in the ordinary case a crime, unless there is some Act of Parliament which makes the trespass a criminal offence (for example, under certain statutes it is a criminal offence for an unauthorised person to cross a railway-line or to enter a Government airfield from which considerations of security require unauthorised persons to be excluded). Secondly, it is not necessary, to constitute a trespass, that *actual damage* should be done to the land or building on which the trespasser has set foot. The essence of the tort is interference with the possession of the other party, and this may arise by merely walking across his field, or throwing refuse upon it, or placing or erecting anything on the land without the other party's consent; any act of *physical interference* suffices.

(3) **Nuisance.**—The *tort of nuisance* arises when an occupier of land or premises does something there which substantially interferes with the enjoyment by a neighbouring occupier of his land or premises. In *trespass* (see above) the interference must be *physical*; this is not so in cases of nuisance. For example, it is a nuisance if A allows his factory chimney to emit volumes of thick smoke which drifts continually into B's house or garden, or for A to carry on, in a building belonging to him, a trade or process which causes noxious smells or disturbing vibrations liable to interfere with B's enjoyment of his property. It is not, however, every such act that gives rise to an action for nuisance; there must be a certain amount of "give and take," particularly in urban areas, but people must not use their premises in an unreasonable or wilfully annoying manner. Thus it has been held that a teacher of music who had pupils singing in her house for several hours a day and on several days a week, which caused considerable disturbance to the person next door, was not committing a nuisance, since it was not unreasonable for her to use her house in this manner. On the other hand, when the person next door retaliated by clashing domestic implements and deliberately making as much noise as possible while the lessons were going on, he was held to have committed a nuisance because his conduct was unreasonable and wilfully annoying. But every case depends upon its own special facts. A building contractor who keeps a pneumatic drill going outside a private house, in connection with building operations, is not liable to an action for nuisance, provided that the use of the drill is necessary to the work, that it is confined to reasonable working hours and limited to a temporary period; but if the owner of a motor-cycle were to keep its engine running, merely to demonstrate its power, outside his own garage for several hours a day, and on several days a week, his neighbours could claim that that was (in law) a nuisance. The Noise Abatement Act, 1960, gives rights to local councils (on their own initiative or on complaint by three householders) to order reduction of unnecessary noise (including loudspeakers) in streets, parks and gardens, and to prosecute offenders.

All the above examples may be classed as *private nuisances*, and they are torts but not crimes. There is, however, another class, known as *public nuisances*, which become criminal offences if they are liable to injure the public in general. Examples of these are leaving an unlighted obstruction on a public road, blocking a public footpath, or allowing a building to get into such a state of disrepair that it causes a danger to users of the public highway. In such cases the person causing the public nuisance may be prosecuted and punished and, moreover, any individual citizen injured by such conduct may have a right to bring a civil action for damages.

(4) **Trespass to Goods** is an unlawful disturbance by A of B's lawful possession of his goods. Such disturbance may arise by seizure or removal of the goods without the owner's consent or by conduct causing damage to the goods. It follows that every theft of goods is also a trespass; but for the preservation of public morality it is laid down that, if there is a criminal element in the conduct of the wrongdoer which makes his trespass theft, the injured party cannot bring a civil action for damages unless the thief has first been prosecuted in a criminal court.

The *tort of detinue* consists in the wrongful detention by one person of another's goods and his failure or refusal to deliver them up when demanded.

The *tort of conversion* or *trover* arises when A wrongfully appropriates the goods of B to his own use or to the use of another person, depriving the owner of them permanently or for a substantial time, or destroying them. These torts of *detinue* and *conversion* can be committed only against goods or articles of property; they cannot arise from interference with fixtures permanently attached to a building, growing crops or trees; but these torts may be committed if, after such things have been removed or cut down, the wrongdoer detains or converts them to his own use.

(5) **Negligence** in law has a very specialised meaning; it is not "neglect" or "carelessness" in the ordinary sense, but failure to take such care as the circumstances of the particular case demand. In the *tort of negligence* there are two essential elements—first, a *legal duty* to exercise proper care and, secondly, a *failure* to take such care. No action for negligence can be brought by A against B, even if B has been grossly careless, unless the relations between the parties were such that B was under that legal duty towards A. Moreover, the *degree of care* which A is entitled to expect from B will vary according to the nature of those relations.

One obvious example where the legal duty of care arises is among persons using the roads. All of us have the right to use the roads for the purpose of travelling, on foot or in some vehicle, and the manner in which each of us exercises that right will obviously affect the safety and comfort of other road-users. There is therefore a *legal duty of care* upon every road-user (under the common law, and quite apart from the provisions of Acts of Parliament relating to motor-cars) to exercise his right to walk or drive with due regard to the similar rights of other road-users. And, equally obviously, the *standard or degree of care* which it is reasonable to expect from the driver of a powerful car is higher than that which is expected from a pedestrian, since the amount of damage which will be caused by carelessness on the part of the driver is very much greater than that which the pedestrian is capable of inflicting.

We are *not* here referring to *offences* under the Road Traffic Acts, for which drivers or pedestrians may be *prosecuted and punished* under the *criminal law*. Careless or reckless driving or walking may be a criminal offence under those Acts, even if it has caused no injury to any person or property. In cases where such injury *has* been caused the *test* to be applied, in determining whether the injured person can *sue and recover damages* against the other party, is whether that other party has fallen short of the *standard of care* reasonably to be expected from him. It is true that disobedience to a provision of the Road Traffic Acts, or neglect of the Highway Code, may constitute *evidence* helping to prove that the latter party was lacking in the proper standard of care required of him; but there may be other circumstances which show that he was *negligent* in law, and liable to an action by the injured party for *damages*, even though he committed *no criminal offence*.

There are many other relationships where the *duty to take care* arises. One of these is the relation between *the occupier of premises* and persons *coming on to the premises*, whether they have a right to be there or not. Towards *trespassers* (see above) the duty of the occupier is merely a negative one—he must not "set a trap"—*i.e.*, he must not deliberately do anything calculated to cause injury, nor must he do any act which, if done carelessly, is reasonably likely to cause injury. If he knows a trespasser is on the premises he must *warn* him before he *does any dangerous act*; the fact that the trespasser has no lawful right to be there does not entitle the occupier (for example) to weaken the supports of a bridge or set off an explosion without warning. If the occupier does so, he will be liable to be sued for damages, in an action for negligence, even by a trespasser who is injured as a result. (The Law Commission has recommended that ownership or use of dangerous things, dangerous activities, and damage by animals be penalised by civil action. Damages are to be assessed on a broader basis.)

The other rules, relating to the duty of care owed by an occupier to persons coming on to his premises, have been modified (as from January 1st, 1958) by the Occupiers' Liability Act, 1957.

The occupier's duty towards a *trespasser* remains *unchanged*. The Act, however, abolishes the former distinction between an *invitee* and a *licensee*, both of whom it describes by the new term, *visitor*. The principal rules are:—

1. The occupier owes the *same duty* ("the common duty of care") *to all his visitors*, except in so far as he is free to, and does, extend, restrict, modify, or exclude his duty, to any visitor, by agreement or otherwise.

2. The "common duty of care" means a duty to take such care as in all the circumstances is *reasonable*, to see that the visitor will be *reasonably safe* in using the premises for the purpose for which he is invited or permitted to be there.

There are *subsidiary rules*—*e.g.*, that an occupier must expect *children* to be *less careful than adults*, and that a person "in the exercise of his calling" (*e.g.*, a window-cleaner) can be expected to appreciate and guard against special risks incidental to that calling. And a *landlord* of premises, if he is under a *legal obligation towards his tenant* to keep the premises in repair, is to owe *to visitors the same duty* as if the landlord were the occupier, so far as concerns dangers arising from his default in carrying out that obligation. One of the matters recommended by the Law Commission (D5(2)) is the creation of a right of redress, for purchasers and visitors injured by defects in a building, against vendors and landlords.

Among the classes of persons upon whom the law imposes a *duty to take care* are those who practise a *profession or calling* which, from its nature, demands some special skill, ability, and experience. A man who is advised or treated by a physician, surgeon, or dentist, or who consults a lawyer or an architect, is entitled to expect him both to possess and to exercise a reasonable degree of such skill, ability, and experience. If the professional man falls short of the *proper standard*, the patient or client may bring against him an action for damages on account of his negligence. But a mere error of judgment on a difficult point does not amount to negligence, provided that the professional man possesses the proper standard of knowledge and skill and has used them carefully and conscientiously to the best of his ability. And he is not liable, by virtue of his professional status, to an action of negligence for something he has done while acting otherwise than in his professional capacity—*e.g.*, a solicitor who is asked to express an opinion on the value of a house (which is no part of his professional duty). (But a barrister cannot be sued for negligence in the conduct of a case in court.)

(6) Defamation.—The tort of *defamation* is committed by a person who *attacks the reputation* of another by "publishing" a *false and defamatory* statement concerning him to a third party. If the defamatory statement is *in writing* or some other *permanent* form (*e.g.*, a picture, a film, or a gramophone record), then the action will be for *libel*. If the defamatory statement is in *spoken words* or some other *non-permanent* form (*e.g.*, by signs or gestures) it will be *slander*.

Another important distinction must be observed at the outset. In cases of *libel* the person whose reputation has been attacked may sue for damages *without proof of "special damage"*—*i.e.*, proof that he has *suffered actual harm* from the libellous statement; while in *slander no action* can normally be brought *unless special damage* can be proved. There are, however, five exceptional cases where such proof is unnecessary, *viz.*, in slanders:—

(*a*) *disparaging* a person in the way of his *business, profession*, or *office of profit* (*e.g.*, saying of a doctor that "he is ignorant of the first principles of medicine");

(*b*) imputing *dishonesty* to a person holding an *office of honour* (*e.g.*, saying of a Councillor that "he gives contracts to his friends");

(*c*) imputing that a person has committed a *crime punishable by imprisonment* (*e.g.*, saying of a man "he is no better than a thief");

(*d*) imputing that a person is suffering from a *contagious disease* of a disgraceful kind (especially a venereal disease);

(*e*) imputing *unchastity* to a *woman or girl*.

In these five cases "publication" of the slander alone is sufficient to give rise to an action, without proof of special damage; for slanders of other kinds no action can be brought unless special damage can be proved.

Note also that no action can succeed, either in libel or slander, unless the statement complained of is (1) *false*, and (2) *defamatory* and unless (3) there has been *publication* to a *third party*. (1) The statement must be false "in substance and in fact"; if it is substantially true the person complaining has suffered no injury, recognised by law, to his right (*see* D12(1)) to the inviolacy of his reputation. (2) The statement must be *defamatory*—*i.e.*, it must be one which "tends to lower him in the estimation of right-thinking members of the community," or which is "calculated to expose him to hatred, ridicule, or contempt." (3) *Publication*, in this context, means simply *making known* the defamatory statement to at least one *third party*. If the defamatory statement is conveyed *only to the person defamed*, and to no one else, there is no "publication," and the person defamed has *no civil remedy*.

In one exceptional case—where a defamatory statement, *in writing*, is likely to lead to a *breach of the peace*—the person making it may be *prosecuted* for the offence of *criminal libel*, for the purpose not of compensating the injured party, but of upholding law and order (*see* D6(1)). In this exceptional case the *truth* of the statement (see above) is *no defence*, and *publication* to a third party is not necessary to secure a conviction. But there is no such offence as "criminal slander."

If a defamatory statement is made reflecting on a *class of persons* generally (*e.g.*, an attack on "Methodists" or "coloured people" or "money-lenders") that will not entitle a person who happens to belong to that class to bring an action unless he can show that *he personally* was aimed at and defamed. The family of a *deceased person*

cannot bring an action for a libel or slander upon the reputation of the deceased.

Parliament has, however, passed new legislation aimed against racial propaganda or discrimination generally (the Race Relations Act, 1965).

If the person sued puts forward the defence that the words he used were "not published of and concerning" the person bringing the action, the question must be decided whether those to whom the statement was published could *reasonably understand* it to refer to him. If such understanding is reasonable, then it is no defence for the person who made the statement to show that he *did not in fact intend* to refer to the other person, or even that the latter's existence was unknown to him.

Some statements are defamatory in their *natural and primary sense* (*e.g.*, "John Brief is a thoroughly dishonest lawyer"); others may appear unexceptionable if looked at literally, but may have a defamatory meaning in a particular context, or in particular circumstances known to the persons to whom they are published (*e.g.*, "I hear Mrs. B has left her doctor a lot of money. A fine kind of doctor *he* is!"). In cases of the latter kind the person who claims that the published words are defamatory of him must plead an *innuendo*—*i.e.*, he must set out, in his statement of claim, the meaning in which he alleges the words complained of were used. It will be the duty of the judge to decide, as a matter of *law*, whether the words are *capable* of bearing that meaning; the jury will have to decide, as a question of *fact*, whether the words complained of did actually convey that meaning to those who heard or read them.

There are several recognised defences to an action of libel or slander:—

(1) *Justification.*—A plea that the words complained of were *substantially true*. Once the words have been shown to be defamatory, it is for the person who used them to prove their truth—not for the party injured to prove them false.

(2) *Absolute Privilege.*—By common law, or by Act of Parliament, defamatory words used on certain particular occasions, though published to third parties, cannot give rise to any right of action. The occasion is "absolutely privileged." No party to any *legal proceedings*, nor any witness, counsel, or member of the jury, nor of course the judge, can be called upon to answer for any words he has used *during the proceedings*, however spiteful, and however harmful they may have been to the reputation of any other person. The rule applies to *pleadings* (*i.e.*, allegations in writing, filed at the court) as well as to statements made in court by word of mouth.

Similar protection applies to words spoken *in Parliament* by a member of either House (though words spoken outside either House are not protected). And under the Parliamentary Papers Act, 1840, those who publish (in the ordinary sense of the word) the proceedings of either House, by its authority, are protected in the same way; so are official communications, on *affairs of State*, made by a minister to the Monarch, or by one officer of State to another in the course of his official duty. To all these *absolute privilege* applies.

(3) *Qualified Privilege.*—Apart from the cases just mentioned, there are other *occasions* which are *privileged*, not absolutely, but in a *qualified* sense. The *nature of the qualification* will be explained below: meanwhile it may be said that a *privileged occasion* of this latter kind arises whenever the person making a communication has an *interest*, or a legal, social, or moral *duty to make it*, and the person to whom it is made has a corresponding interest or duty *to receive it*. A common example is a reference given, about the character of a servant, by a former to a prospective employer; another is a report made, on the commercial credit of a trader, by one person who has dealt with him to another who intends to do so. Other occasions of *qualified privilege* are *reports* of *judicial proceedings*, of *public meetings*, and of the *proceedings* of municipal or other *public bodies*.

Such occasions are *privileged* to this extent and with this qualification—that there was no *malice* (*i.e.*, spite or other *improper motive*) in the mind of the person when he made the communication. If there was malice, then the fact that the occasion was one of qualified privilege will not protect him from an action for damages at the suit of the person defamed. In any such action it is the duty of the judge to decide, as a question of *law*, whether the occasion was one of qualified privilege; it is for the jury to decide, as a matter of *fact*, whether the defendant was malicious in what he wrote or spoke. (Contrast occasions of *absolute privilege*, where the presence or absence of *malice is immaterial*.)

(4) *Fair Comment* "on a matter of public interest."—This form of defence is most commonly employed by newspapermen, reviewers, and critics. If this defence is to succeed, the words to which it relates must be really *comment* (*i.e.*, expressions of opinion, not statements of fact): the comment must be concerned with *a matter of public interest* (*e.g.*, a book, a play, a musical performance, a political speech, or the public actions of men in the public eye—but not their private lives). Lastly, the comment must be *fair*—and it cannot be fair if it is actuated by *malice* in the mind of the commentator. If he has mingled with his comment some statement of *fact*, and that statement is inaccurate or misleading, that in itself will prevent the comment from being regarded as fair. The *onus is on the defendant* who is pleading fair comment to establish that what he is seeking to defend is really *comment*, that the matter on which he commented was one of *public interest* (not, for example, private scandal), and that the comment is *not based on any misstatement* of facts or *otherwise unfair*. Dishonest or insincere comment cannot be fair; but, on the other hand, an honest belief in the commentator's mind that his comment was fair is not enough for a successful defence. The comment must be fair *in fact*.

The usual *remedy* in actions of *libel* and *slander* is damages—a sum of money sufficient (in the jury's view) to compensate a man for the harm his reputation has suffered. In certain rare cases the Court may, in its discretion, grant an *injunction* ordering the defendant not to publish or not to repeat the publication of a libel.

The Defamation Act, 1952, reduces the risk of legal proceedings against anyone who *innocently* "published" a libel. The "publisher" may make an *offer of amends*, *i.e.*, an offer to "publish" a *correction and apology*, and to take practicable steps to *notify* those who have received copies of any defamatory document. (*a*) If the offer is *accepted* and the promise performed, the party defamed cannot bring, or continue, an action for libel or slander. (*b*) If the offer is *rejected*, then the "publisher," in any action taken against him, may plead, *in defence*, that the words were "published" innocently, and that the offer of amends was made as soon as practicable. *Innocent* publication means: (1) that the "publisher" did not intend the defamatory words to refer to the other party, and knew of no reason why they might be understood to refer to him; or (2) that the words were not in themselves defamatory, and that the "publisher" knew of no reason why they might be understood to defame the other party; also that, in either case, the "publisher" exercised all reasonable care in regard to the "publication."

V. THE LAW OF PROPERTY

I. In General

(1) Living Persons.—The special rights and disabilities which affect the ownership and disposal of property by certain classes of persons have been already dealt with under the heading of *Status* (D7–8). It is unnecessary to add anything here on the law of property *in general*, so far as living persons are concerned; but different rules are applicable (as will be seen below) to the ownership and disposal of *land and buildings* as compared with *property of other kinds*. The reason for this main distinction is that the former are, in their nature, *immoveable* and *cannot be physically transferred*, as can money and "chattels" (*i.e.*, animals and *tangible objects* which are capable of being owned). In addition, there is a third class—certain *intangible things* which can be owned and dealt with—for example, the right to be paid a debt, a share or stock in a company, an insurance policy, or a patent; these are known as *things in action*, and they can be transferred only in certain formal ways, which will be described below.

(2) Deceased Persons.—It is obvious that the law of any civilised community must make provision, not only for the *transfer by a living person of his property*, but also for the *transmission of that property (his "estate") upon his death*. English Law permits every person who is *not disqualified by infancy or lunacy* (*see* D7) to *give directions, during his lifetime, as to the disposal of his estate upon his death*; he can do this by means of a *will*. If he leaves *no valid will* he is said to die *intestate*, and in that event *the law itself* lays down how his estate is to be distributed. A concise survey of the law governing the estates of deceased persons is given below. (Some of these rules have been modified, so far as *domicil* is concerned, by the Wills Act, 1963.)

Wills and Intestacies.—The law of wills is highly technical; much trouble can be caused by a "home-made" will, and it is wise to seek a solicitor's advice. It is only possible here to outline the *formalities* necessary to make a valid will, and the *procedure* to be adopted after a death. The rules stated are those under English law—applicable to England and Wales, but not Scotland or Northern Ireland.

(1) The Nature of a Will.—The person making a will—the *testator*—sets down how he wishes his property to be disposed of after his death, and states the names of the persons (the *executors*) who are to attend to its disposal.

The executors may be, but need not be, some or all of the persons whom the testator desires to benefit under his will. One executor alone is sufficient in law; but if that one dies before he (or she) has completed his duties, delay and difficulty may arise. It is therefore better to appoint *at least two* executors; if one dies, the other has full powers to continue the work. If the testator's *estate* (that is, his property) is large, it may be best to appoint a bank as executor; all banks have trustee departments which are experienced in such matters. They have scales of charges for executorship work, which will be supplied on request. An executor is not permitted to charge for his work, unless the will authorises him to do so—a thoughtful provision for a complicated estate. Nor is the executor bound to accept the executorship when the death occurs.

A will "speaks from death"—that is, it has no legal effect until the testator dies; it can be *revoked* (that is, cancelled) in various ways, or alterations can be made by *codicil*, which is really a supplementary will. Further, the property to which it relates is that of the testator *at the date of his death*, which may be more or less than what he owns at the date when the will is made. The will can be revoked or varied as often as desired to suit changing circumstances; its provisions are not final until death.

Generally speaking, a testator may make whatever provisions, in regard to his or her property and the persons to be benefited, he or she thinks fit. He or she may even direct that his or her wife, husband, or children are to be deprived of all benefit from the estate; but, if he or she does so, it will be well to give the reasons, either in the will itself, or in a signed, witnessed, and dated document, which should be left with the will.

Under Acts of 1938, 1952, 1965, and 1966 a husband or wife, an unmarried daughter or son under twenty-one, or a son or daughter, either natural or adopted, "under disability" (that is, one who for some reason is incapable of looking after himself or herself), who is not adequately provided for under the will, may apply to the Court for "reasonable provision for maintenance" out of the estate; the Court has power either to refuse the application or to grant the applicant whatever maintenance it thinks fit. In making its decision the Court will take note of the testator's reasons for his failure to provide for the applicant in question. (*See also* D32(2) relating to former husbands and wives).

If a person dies without leaving a valid will, he is said to die *intestate*. In that case somebody (usually the husband or wife or next of kin) must apply to the Probate Registry (at Somerset House in London or in the nearest District Registry elsewhere) to be appointed *administrator*. An administrator has the same rights and duties as an executor. If there are children under twenty-one, and in certain other cases, there must be at least two administrators, and the procedure on death is more involved and troublesome than where executors have been appointed by will. Further, as the testator has not directed what is to happen to his property, the law has laid down an *order of succession*, which the administrators must observe. The intestate's husband or wife is then entitled first to the *personal effects* (furniture, household goods, motor-cars, books, etc.); next, to the whole of the estate, if there are no children or near relatives, or £8,750 if there are, and, after that, the husband or wife and children have certain rights in the remainder of the estate, if any, details of which can be found in the Intestates' Estates Act, 1952, and the Family Provision Act, 1966. If there is no husband or wife, or no children, or neither, the next of kin of the intestate will benefit in order of nearness of their relationship to the deceased.

It is always prudent to make a will, however simple, since by doing so the testator exercises control over the disposal of his property and saves considerable trouble for his family.

(2) The Execution of a Will.—The formalities must be strictly observed, except in the case of soldiers, sailors, and airmen on active service (including members of the Women's Services and nurses), for whom informal directions, even in a letter or by word of mouth, are sufficient. For all other testators, inattention to the formalities may render the will invalid, and will in any case cause considerable trouble and expense.

The will must be *in writing*—*i.e.*, not by word of mouth—handwritten, typewritten, or printed, but the wording need not be in legal or formal language, so long as it clearly identifies the testator, the executors, the various kinds of property dealt with, and the persons to be benefited. It should also state that the following formalities have been carried out when it was executed—that is, signed by the testator and *attested*—*i.e.*, witnessed by two competent persons:

(a) *The will must be signed* by the testator, or by some other person in his presence and by his direction. If the testator can write, his *usual* signature will suffice; if he is illiterate or too unwell to sign in full, he may make his "mark" or his initials alone. If he is incapable of holding a pen, someone else may sign for the testator, provided he is present at the time and authorises the signature. If the testator is blind or otherwise incapable of reading the will, it should be read over to him before his signature or mark is placed on it, and the fact of his blindness should be mentioned in the final clause.

(b) *The signature or mark must be at the foot or end* of the will. This means (i) nothing added

below the testator's signature, and (ii) nothing written anywhere on the document *after the testator himself has finished signing*, will be valid, except the signatures, addresses, and descriptions of the witnesses. If, therefore, at the last minute the testator desires some addition, alteration, or deletion to be made, he and the same witnesses must sign or put their initials against the addition, alteration, or deletion, which otherwise will be ignored.

(c) *The testator's signature* must be made or (if he cannot sign) acknowledged *in the presence of two witnesses*, who must both be *present at the same time*. Any persons may be witnesses, so long as they are capable of understanding what is going on. They need not read the will or know its contents; but if either of them is a *person who is to take a benefit* under the will, or the husband or wife of such a person, he or she will *lose that benefit*. It is therefore safest to call in witnesses who are strangers to the testator. Both witnesses must be *present together* when the testator signs (or acknowledges) his signature; it will not be a valid attestation if first one witness, and then the other, is called into the room. (The wife or husband of a beneficiary must not be a witness.)

(d) *The witnesses must sign* the will *in the presence of the testator*. Either witness may, if necessary, sign by mark or initial, but no other person may sign on his behalf. For identification purposes it is usual and desirable for the witnesses to add their addresses and occupations, in case of a subsequent dispute which may necessitate their being found to give evidence.

If the will consists of several pages, they should be fastened together before execution, and the signatures of the testator and witnesses should appear at the end of every page, not to satisfy the rules set out above, but as evidence that every page formed part of the will when it was executed.

It is desirable (though not legally essential) that the will should bear, just above the signatures of the witnesses, an *attestation clause*—that is, a formal statement that these formalities have been carried out. The usual wording of this clause will be found in the example shown below.

All these rules apply in exactly the same way to a *codicil*, which is a *supplementary* document, *amending* the will in part, *e.g.*, by adding a new legacy.

(3) The Contents of a Will.—The opening words should clearly identify the testator by his full names, occupation or description, present address and (if possible) other recent addresses, and declare that this is his *Last Will*. It is sometimes found at death that a testator has a banking account or stocks and shares registered in his name at some past address, and in such cases the bank or company concerned, wishing to be sure that his identity is clear, may insist upon a sworn statement to the effect that he is the same person as the person they knew as customer or shareholder. (See the example below.)

Next follows the *revocation clause*—a declaration that the will now being made *revokes* (that is, cancels) all previous wills and codicils. If this is not inserted, doubts may arise after death as to whether the new provisions are intended to be substituted for, or merely to supplement, provisions in an older will. If it is intended that the older will is to remain valid in part, that should be clearly stated. If the document now being executed is a *codicil*, it should be described as such, and the date of the original will to which it is a codicil should be mentioned, and also which parts of the original will are being *confirmed*, to stand good, and which *revoked*.

The next clause should appoint the executors, who must be identified by their full names and descriptions or addresses. "My brother John," "my son Charles," or "my mother" will suffice, since only one person could possibly answer to any of these descriptions; but "my wife" is not enough without giving her names in full, since it does not follow that the person who is the testator's wife at the time of his death was necessarily his wife when the will was made.

Next follow the directions for disposal of the testator's property. *Bequests or legacies* of particular articles ("my pearl necklace," "my oak bedroom suite") or of particular investments ("my 3% War Stock")—these are *specific legacies*—must clearly identify exactly what is being bequeathed. In the case of land or a house, the full description should be given—"my leasehold house and grounds at 31, Acacia Road, Redhill in the County of Surrey," or "my freehold farm known as 'Newlands' at Northgate in the County of Derby." The words "I devise" are the technical words appropriate to freeholds; "I bequeath" to all other kinds of property: the effect is the same. (Bequests or legacies of *sums of money*—*pecuniary legacies*—should preferably be stated in words rather than figures; if figures are used the accidental omission of a nought may be disastrous.)

Finally, there is the clause that deals with the *residue* of the Estate—that is to say, whatever will remain after the executors have paid the funeral expenses, death duties (if any), legal and other fees, the testator's debts, and the pecuniary legacies he has bequeathed, and after the specific bequests have been handed over to those entitled. Such a clause is necessary because no testator can be sure, when he makes his will, that he has disposed exactly of everything of which he may die possessed, or that all the persons to whom he has made bequests will necessarily be alive, when he dies. In general, the death of such a person—a *legatee*—before the testator causes that person's legacy to *lapse*; but if there is a bequest of the *residue* for division among a number of persons, no harm is done: the *lapsed legacy*, being left over and undisposed of, leaves the residue to be divided among the surviving *residuary legatees*. The expression "such of the following persons who may survive me" may be properly used.

(4) Revocation and Revival.—A will or codicil may be *revoked* (*i.e.*, cancelled) by "burning, tearing, or otherwise destroying" it with the intention of revoking. Destruction by accident, or without the testator's desire to revoke it, is ineffective, and if a copy exists, its provisions may be put forward as still valid. The revocation clause in a later will (see above) will be equally effective to revoke an earlier will; or some part of the earlier will may be revoked by a later codicil clearly referring to that part.

A will is also *revoked*—generally speaking—by *subsequent marriage*, since the law assumes that, if the testator who is newly married had had time for or given thought to the matter, he would have altered his will. If he did not do so after marriage, he will die intestate.

If a testator makes *Will A*, and later on *Will B* containing a revocation clause, Will A is revoked—*i.e.*, cancelled. But if *Will B* is in turn revoked by *Will C*, that does *not revive*—*i.e.*, revalidate—*Will A*, unless *Will C* says, in so many words, that "*Will A* is hereby revived."

SPECIMEN WILL

I JOHN SMITH of 31 Acacia Road Redhill in the County of Surrey Company Director [1] HEREBY REVOKE [2] all wills and testamentary documents [3] heretofore made by me AND DECLARE this to be my LAST WILL.

1. I APPOINT my wife JANE SMITH [4] and my Solicitor EDWARD JONES to be jointly the Executors of this my Will.

2. I DEVISE my freehold farm known as "Newlands" situate at Northgate in the County of Derby unto my son JAMES SMITH in fee simple.[5]

3. I BEQUEATH the following specific legacies: [6]

(1) To my son THOMAS SMITH any motor-car of which I may be the owner [7] at the date of my death.

(2) To my said son JAMES SMITH all my shares in the Company known as John Smith & Sons Limited.

(3) To my said wife all my personal chattels [8] not hereby or by any codicil hereto otherwise bequeathed [9] for her own absolute use and benefit.[10]

4. I BEQUEATH the following pecuniary[11] legacies:

(1) To my daughter JULIA SMITH the sum of TWO THOUSAND POUNDS.

(2) To my secretary EVELYN ROBINSON the sum of ONE HUNDRED POUNDS.

5. I DEVISE AND BEQUEATH all the residue [12] of my real and personal estate whatsoever and wheresoever not hereby or by any codicil hereto otherwise expressly disposed of as to my freeholds in fee simple [5] and as to my personal estate absolutely unto my said wife JANE SMITH for her own absolute use and benefit.[10]

6. I DIRECT that any executor of this my Will being a Solicitor or a person engaged in any profession or business may be so employed and act and shall be entitled to make all proper professional charges [13] for any work done by him or his firm in connection with my Estate including work which an executor not being a Solicitor or a person engaged as aforesaid could have done personally.

IN WITNESS whereof I the said JOHN SMITH the Testator have to this my LAST WILL set my hand this twelfth day of April One Thousand Nine Hundred and Sixty-Five.

[4] SIGNED AND ACKNOWLEDGED by the above-named JOHN SMITH the Testator as and for his LAST WILL in the presence of us both present at the same time who at his request in his presence and in the presence of each other have hereunto subscribed our names as witnesses: } John Smith

George Matthews,
6, Elm Road,
Redhill, Surrey.
Chauffeur.

Ida Gray,
10, Oaktree Road,
Redhill, Surrey.
Children's Nurse.

[1] Profession is usually inserted for identification purposes.

[2] Revocation Clause—cancels all *previous* wills and codicils.

[3] "Testamentary documents"—includes both wills and codicils.

[4] Wife's *name* should be mentioned—he may have a different wife by the time he dies.

[5] "In fee simple"—technical words showing that the entire freehold interest is disposed of.

[6] "Specific legacies"—*i.e.*, legacies of actually specified things.

Not "my motor-car"; he may sell his present car before he dies and perhaps buy a new one, in which case there might be a dispute as to whether he meant only the car he owned at the date of his will.

[8] This expression is defined in the Administration of Estates Act, 1925. It includes furniture, plate, china, wines, cigars, books, and other *personal effects*. It is better to use a word clearly *defined* by Act of Parliament than a vague word like " pos

[9] *i.e.*, all personal effects which the Testator has not left or will not leave to anybody else.

[10] These words show clearly that, although the wife is one of the Executors, with the duty of clearing up the estate for the benefit of *all* the persons to be benefited, these particular bequests are for *her own personal benefit*.

[11] "Pecuniary"—*i.e.*, money.

[12] "Residue"—everything left after all the other gifts have been disposed of, and debts paid.

[13] Charging Clause, without which the Executor who is a Solicitor would not be able to charge for his work on the Estate.

[4] This is the proper form of *attestation clause*—*i.e.*, the clause showing that the proper formalities for signing and witnessing were observed.

Probate and Letters of Administration.—It is a peculiarity of the English system that a deceased person's estate, upon his death, does not "vest in" (*i.e.*, fall into the possession of) the persons to whom he has left it by will, or among whom it has by law to be distributed (the "beneficiaries"); the estate vests, in the first instance, in his executor or executors, if he has appointed any such. (If he has made no such appointment, then, pending the appointment of administrator or administrators (see above), the estate vests (for the time being) in the Presiding Judge of the Probate Division of the High Court of Justice; that Judge has no duties in relation to the estate, but any notices that would, if there were executors, have to be served upon them, must be served for the time being upon him.) The generic name that applies both to executors and administrators, when their title has been lawfully recognised, is *legal personal representatives*; that is to say, they are *recognised by law as representing the deceased person*, for all purposes under the law of property, and for most purposes under the law of contract and the law of tort. Generally speaking, the deceased person's rights and liabilities are transmitted to his legal personal representatives, and can be enforced by or against them as soon as they have taken out a *grant of probate* or of *letters of administration*. (Small estates—less than £1,000 net or £3,000 gross—are dealt with more simply.)

The "grant," in either case, is a document issued by one of the Registries and bearing the seal of the Probate Division of the High Court and the signature of one of its Registrars. It states the deceased's name and address, the date and place of his death, and *either* (1) that his *last will* has been *proved and registered* in the Registry concerned, or (2) that he died *intestate* (as the case may be); that (in the former case) the *executors*, or (in the latter case) the *administrators*, whose names, addresses, and descriptions are given, are *entitled to administer* (*i.e.*, to deal with) all the estate which "vests in" them by law; and the document concludes by certifying that an *Inland Revenue Affidavit* has been delivered, showing the *gross and net values* of the estate and the amount of *estate duty and interest* (if any) paid. Where a will has been "proved," a photostat copy of the will is bound up inside the "grant"; if no will has been "proved" the "grant" consists of a single sheet bearing the above-mentioned particulars. It is important to note that, in either case, the *title* of the *legal personal representatives*

(*i.e.*, their legal right to deal with the estate) is evidenced by the "grant"—*i.e.*, the document by which the Court's authority is conferred upon them—and not directly by the terms of the will or by their relationship (if any) to the deceased. Anybody, for example, who is *purchasing property of the deceased* from the legal personal representatives is required only to *satisfy himself that probate or letters of administration have been granted to them*; such a purchaser is not in the least concerned with the terms of the will.

Whenever any *formal transaction* has to be carried out in connection with the deceased person's estate the "grant" must be produced: this applies in particular to dealings with land or buildings, "things in action" (*see* D23(2)), the initiation, defence, or continuation of legal proceedings for the benefit of the estate, and the transfer of the deceased's contractual rights. There are, however, a number of *informal acts* which the persons (if any) appointed by the will to be executors, or the nearest relatives who intend to apply for letters of administration, may properly do before the issue of the "grant": these include such common-sense matters as arranging the funeral, safeguarding and insuring documents and valuables, feeding livestock, locking up premises, and preserving property which would deteriorate if neglected. All persons should, however, take care *not to sell or dispose of any part of the estate before the "grant"* is issued: a person who, without lawful authority, meddles with the estate may find himself regarded as *executor de son tort*—*i.e.*, placed in the position of an executor by his own wrongdoing—and thereby bound to meet the liabilities of the deceased person, and pay the death duties (if any), for which he ought to have provided. Even a person named in the will as executor takes a risk if he does more than the most urgently necessary acts before probate, since it may turn out that that will is, for some technical reason, invalid, or some later will may come to light in which he is not named.

Not more than four persons can apply for a grant of probate or letters of administration. If therefore the will names more than four executors, the persons named will have to decide among themselves which of them are to apply. Even if there are no more than four, *none of them is compelled* to apply, unless he has already meddled with the estate; he can renounce his right by signing a form of renunciation. If the deceased has appointed no executor by will, one or more (not exceeding four) of the next-of-kin can apply for letters of administration. Apart from the special cases (see above) in which there must be at least two administrators, no grant will be made to any more distant relative of the deceased unless and until all nearer relatives have renounced their rights or been "cleared off"; this last expression means that it must be clearly shown that they are dead or for some other reason are incapable of acting as administrators. (The order of priority among the relatives entitled to take out a grant is: (1) husband or wife; (2) children and their "remoter issue" (*i.e.*, grandchildren, great-grandchildren, etc.); (3) parents; (4) brothers and sisters and issue of deceased brothers and sisters; (5) half-brothers and half-sisters and issue of deceased half-brothers and half-sisters; (6) grandparents, and so forth.)

It has been said above that the property of a deceased person "vests" on his death in his executor or executors, if any; if there are no executors it "vests" in his administrators as soon as they have been duly constituted as such by the "grant." *In law* these *legal personal representatives* (executors or administrators) have the same *powers* of disposing of the deceased's property as if they were the owners of that property in the fullest sense; but in accordance with the rules of *equity* (*see* D4) they must exercise their powers of disposal strictly in accordance with what is *just and conscionable*—*i.e.*, they must distribute the property itself, or sell it and distribute the net proceeds, as laid down by the terms of the *will* (if any); in case of an intestacy, as laid down by the *law of succession*, as set out in the Intestates' Estates Act, 1952, and the Family Provision Act, 1966. That strict exercise of their powers which conscience demands will be enforced, in case of need, by the Chancery Division of the High Court of Justice (*see* D5), *at the suit of any beneficiary* under the will or intestacy. But *purchasers* and persons other than the beneficiaries can safely deal with the legal personal representatives as though they were legal owners of the deceased's property, provided the "grant" is produced as evidence of their powers.

The *procedure* in applying for a *grant of probate or letters of administration* is that the applicants must make a *valuation* of the various kinds of property of which the estate consists; the value of each item is to be the value on the date of death. (It is not usually necessary to employ a licensed valuer, though this may be helpful if the estate includes valuable jewellery, antiques, or works of art.) An *Inland Revenue Affidavit*, for death-duty purposes, must be *completed* and *sworn before a Commissioner for Oaths*. This document is one of a number of printed forms (varying according to the nature and composition of the estate, and obtainable from Somerset House, the Estate Duty Office, and certain principal post offices). It is divided into headed columns showing (*a*) the descriptions and the values of the various parts of the estate (*e.g.*, cash at bank, Government securities, stocks and shares, furniture and effects, and so forth); a separate section shows (*b*) the funeral expenses and the debts which the deceased left owing. The *gross estate* consist of the items under (*a*); the *net estate* is calculated by deducting those under (*b*) from the gross total (the cost of a tombstone cannot be deducted).

In the simplest cases *estate duty* is payable on the *net estate*, according to a sliding scale; but no duty is payable on an estate of £5000 or less. (In all but the simplest cases it would be wise to consult a solicitor, as the law relating to estate duty is excessively complicated.)

Another part of the document sets out particulars of the deceased and of the applicants, and the kind of grant required. The document, when sworn, must be forwarded to the Estate Duty Office, who will *assess the duty payable* (if any) and interest on such duty from the date of death. This must be *paid in full* before proceeding further, *except* the part of the duty that relates to *freehold property*, which may be paid by instalments. (The deceased's bank will usually grant a loan or overdraft for the purpose of such payment.) When the duty has been paid the Inland Revenue Affidavit will be returned to the applicants receipted.

The second document required is the *Form of Oath for Executors or Administrators*. This gives particulars of the deceased and of the applicants, as before, and declares *either* (*a*) that they believe the "paper writing" before them to be the deceased's *last will*, or (*b*) that the deceased died *intestate*; in either case they declare their *relationship* (if any) to the deceased, and the *capacity* in which they apply (*e.g.*, "the executors named in the will," or "the lawful widow of the deceased," or as the case may be); and they swear *to administer* the estate (the gross amount of which they mention) *according to law*, and to produce proper accounts whenever called upon to do so. This Oath must also be sworn before a Commissioner.

If there is a will it must now be signed (for identification purposes) by the applicants and the Commissioner for Oaths. If there is no will a third document is required, known as an *Administration Bond*. This is a printed form which must be completed and signed, sealed, and delivered (*see* D9(2)) by the applicants and two *sureties*—*i.e.*, independent persons who are willing to *guarantee* that the applicants will carry out their duties according to law, under the *penalty* of forfeiting double the value of the estate if there is any default. (In practice, an *insurance company* will usually undertake *the duty of surety* for a reasonable premium, and in that event no other surety is required.) The Bond must be executed (*i.e.*, signed, sealed, and delivered by the individual sureties, or sealed by the insurance company, and

also signed, sealed, and delivered by the applicants) before a Commissioner for Oaths.

Finally, the applicants must take to the Principal Probate Registry at Somerset House, or to one of the District Registries outside London, (*a*) the receipted Inland Revenue Affidavit; (*b*) the duly sworn Oath for Executors or Administrators; (*c*) *either* the will (if any), duly marked with the signatures of the applicants and the Commissioner, *or* the Administration Bond, duly executed. If there is no hitch, the *grant of probate* or *letters of administration* will usually be posted to the applicants (or their solicitor) within about fourteen days.

(For the convenience of persons who have no legal adviser, there is a Personal Applications Department, situated in Bush House, Aldwych, W.C.2, where the officials are extremely helpful in answering questions and showing applicants how to complete the forms. But in most cases trouble and delay will be avoided by employing a solicitor.)

II. Property in Land (Immoveable Property)

Although the *logical distinction* preserved in the legal systems of other countries is between property in land and buildings and property of other kinds ("immoveables" and "moveables"), English law has from an early date made the more artificial distinction between *real property* or *realty* (*i.e., freeholds*) and *personal property* or *personalty* (*i.e., leasehold* land and property of all other kinds). The reason is historical. In early times, if the possession of freehold land was withheld from its rightful owner, his remedy was an action for recovery of the actual thing withheld—*i.e.*, the freehold land itself—and that very *thing* (in Latin, *res*) would be restored to the owner under an order of the Court. On the other hand, when property of other kinds (including leaseholds) was withheld from its rightful owner, his remedy was an action against the wrongdoer, in which the remedy would be the award of *damages* against the wrongdoer *personally* (*in personam*)—not an order for the restoration of the actual goods or other property withheld. Although that distinction in the remedies is no longer generally applicable, the terms (*realty* and *personalty*) have been retained.

1. Realty or Freehold Property.—The difficulties of this branch of the law are due principally to historical reasons which go back to the Feudal System. In a very practical sense that System recognised only the Monarch as the *owner* of land; those who held it from him were *tenants* (in French, "holders"). If the tenancy was one which was not limited to expire at the end of a fixed period it was known as "an estate in fee simple"—*i.e.*, a *freehold*; a tenancy which was for a fixed period only was known as "a term of years absolute," or a *leasehold*.

When the Feudal System came to an end this distinction remained. A freehold estate in land is still an interest which has *no fixed expiry date*; and the freeholder, out of that unlimited interest, can "carve," as it were, *fixed leasehold terms*, during which tenants will hold the land of him.

The property legislation of 1925 has profoundly changed and simplified the law. Until the end of 1925 one important characteristic of the freehold estate was that of *primogeniture*—the rule that, on the death of the freeholder intestate, the freehold passed intact to his *eldest son* or (if he left no son) to his eldest male heir. This was abolished by the Administration of Estates Act, 1925, which enacted that, in the event of a person's dying intestate after December 31st, 1925, the *whole of his property* (realty as well as personalty) should devolve upon his legal personal representatives (*see* D18); and that it should, as one whole, be sold and converted into money so far as necessary for the payment of the deceased's funeral expenses and debts, death duties, administration expenses, and for distribution among his next of kin. The eldest son, or heir, has no longer any special privilege.

Settlements.—On the other hand, a freeholder (whom we will call Charles), having a freehold estate in land—*i.e.*, an interest which has no expiry date—can *during his lifetime* create *successive interests* to take effect one by one. Charles can, if he so desires, *settle* his freehold estate to be enjoyed by himself during his lifetime; after his own death, by his eldest son George during that son's lifetime; then by his second son John, during John's lifetime, and finally by George's son Peter "in fee simple." The successive interests of Charles, George, and John are called *life interests*; the ultimate, future freehold interest, reserved for Peter to enjoy after the deaths of his grandfather, his father, and his uncle, is called a *remainder*. Both the life interests and the remainder are *rights of property* to which Charles, George, John, and Peter become *entitled immediately* the settlement is made—that is, they are *present rights* to the *future enjoyment* of the property, and those rights can be dealt with at any time, even before they "fall into possession." Since Charles, George, and John *must* some time die, Peter knows *now* that his freehold remainder *must* come, some time, to him or his personal representatives and, through them, to his next of kin (see above); for even if he dies young, while George and John are still alive, his right will not be "defeated" but will be preserved for those to whom his property may eventually pass under his will or intestacy. Therefore that *present right* to *future enjoyment* is a piece of property which Peter can deal with *now*, unless he is a minor, or unless he is restricted by the terms of the settlement from doing so. George and John can, if they are so minded, do the same with their life interests—that is, they can *now* sell to another person, for hard cash, their present rights of future enjoyment, or they can mortgage (*i.e.*, pledge) those rights against a loan, on the understanding that they will get back those rights when the loan is repaid.

To watch over these successive interests, and to preserve the rights of the ultimate successor, Charles appoints *trustees* of the settlement, whose duty it is to act impartially by all the beneficiaries. A *trust corporation* (usually one of the bank trustee companies), which never dies, or *at least two individuals*, may act as trustees. The Trustee Act, 1925, provides for the appointment, by a simple procedure, of new trustees to take the place of those who die, become unfit, or unwilling to go on acting, etc. In the last resort the Chancery Division of the High Court (the guardian of equity) has power to make such an appointment; for "equity never lacks a trustee."

In order to enable landed property to be freely disposed of, it is provided by the Settled Land Act, 1925, that the person who is for the time being enjoying the current life interest (see above) has power to *sell the entire freehold* estate if he so desires. Nevertheless, the scheme of interests under the settlement is not defeated, for the purchaser from the tenant for life must pay the purchase-money not to him but to the trustees; they must invest the money in safe investments, and carry out the provisions of the trust with the necessary modifications. Each *tenant for life* will then receive the *interest or dividends* on the investments during his lifetime, just as formerly he would have received the rents and profits of the land during his lifetime; while the *remainderman* (Peter) will ultimately come into the *capital* of the trust fund (*i.e.*, the investments themselves) in lieu of the freehold interest. (By the terms of a recent Act, half the investments may consist of stocks or shares in commercial concerns recommended by a stockbroker or other competent adviser.)

2. Leaseholds.—We have seen above that the freeholder, out of his estate which is unlimited in time, can "carve" fixed *terms of years absolute* or *leasehold* estates. These terms may be of any length; the most common are terms of 999 and 99 years. The document by which such a term is granted is called a *lease*; the person granting the term is the *landlord* or *lessor*; the person to whom it is granted is the *tenant* or *lessee*. But the lessor, by the grant of a lease, has not given up *all* interest in the land. The lessor's freehold estate is unlimited in time; when, therefore, the leasehold term (however long) comes to an end, the right to possession and enjoyment of the land will

revert to the freeholder. That right, known as a *reversion*, is again a *present right* to *future enjoyment* and, as such, a piece of property which the freeholder can, if he wishes, dispose of *now*. The "sale of a reversion" is, in fact, equivalent to the sale of the freehold subject to an existing lease; it confers upon the purchaser the lessor's right to receive rent from the lessee throughout the leasehold term, and at the expiration of that term to *repossess and enjoy* the land without limit of time.

The *lessee* has a *legal estate* in the land for a *fixed term* of years, and he in turn (unless prohibited by the provisions of his lease) can grant *sub-terms* to expire at any time before his own *head-term*. This is a process which can be repeated, in turn, by each lessee, underlessee, sub-underlessee, and so forth, who will become respectively the underlessor, sub-underlessor, and so forth, of the person to whom the next subordinate interest is granted. Thus Michael, the freeholder, by granting to James a term of 999 years, leaves himself with a *freehold reversion* which will revert, at the expiration of the 999 years, into the possession of the then freeholder. James, by the grant of an underlease, can carve (out of his leasehold term of 999 years) a sub-term of 99 years in favour of William, whose underlessor or landlord he becomes, leaving himself with a *leasehold reversion* of 900 years. William, in his turn, can grant to Anne a sub-underlease for 21 years, leaving himself a *leasehold reversion* of 78 years, and so forth. The relationship of lessor and lessee, or landlord and tenant, subsists between William and Anne, James and William, Michael and James; this relationship is one of *privity of estate* as well as *privity of contract*. The former phrase means that each of these pairs of individuals is linked by their *mutual interest in the same term of years* as above described. The latter phrase, *privity of contract*, means that the *link is contractual*—it arises from the agreement between Michael and James contained in the headlease, the agreement in the underlease between James and William, and that in the sub-underlease between William and Anne. But between Anne and James, between William and Michael, there is no relationship of any kind, neither of contract nor of estate; Michael can look only to James, James to William, and William to Anne, to carry out the terms of the respective tenancies.

In certain circumstances, however, there may be *privity of estate* between two parties without *privity of contract*. Suppose Michael *conveys* (*i.e.*, transfers) his freehold reversion, *during the subsistence of James's lease*, to Robert. Thereby Robert will take over all Michael's rights; *i.e.*, he will become lessor, in place of Michael, to James as lessee, as well as being entitled to possession of the freehold when James's lease expires. Between Robert and James there will be *privity of estate*, arising from their mutual interest in the term of 999 years (as lessor and lessee respectively); but there is between them no *privity of contract*, for Robert and James have made *no agreement* with one another. The distinction may in certain circumstances be important.

The Form and Contents of a Lease.—A lease for a term of more than three years must be made by deed (D9(2)) between the lessor and the lessee. It names and describes the parties, and sets forth that, in return for an annual *rent* (and sometimes on payment, in addition, of a lump sum called a *premium*), the lessor *demises* (*i.e.*, lets) to the lessee, for a term of so many years from such and such a date, the land in question with the buildings erected thereon. (In the law of property the buildings go with the land on which they stand.) Then follow the *lessee's covenants*—the promises which he is to perform: to pay the rent by stipulated instalments, on certain dates; to pay rates, taxes, and other outgoings on the property to put and keep the property in full repair; to paint the inside and the outside of the buildings at stated times; to keep the property insured, to its full value, in the names of the lessor and himself; to permit the lessor periodically to inspect the condition of the property; to carry out repairs which the lessor, as a result of such inspections, may call upon him to carry out. These are some of the stock clauses; but every individual lease must be carefully studied in order to ascertain what the lessee's obligations are.

Next come the *lessor's covenants*—the promises which the lessor is to perform; the chief of these is that, if the lessee carries out his part of the bargain, the lessor will permit him "quiet enjoyment" of the property without disturbance during the term. Some leases also contain *stipulations* binding on both parties; for example, a *stipulation* that the rent shall be reduced or suspended if the property is damaged or destroyed by fire, and sometimes an arbitration clause. At the end of most leases comes a *proviso*, for the protection of the lessor, to the effect that he shall be entitled to expel the lessee, and to re-enter and repossess the property, if the lessee ceases to pay his rent or to perform his covenants as required, or in the event of the lessee's bankruptcy.

One copy of the lease (the *original*) is signed, sealed, and delivered (D9(2)) by the lessor, and handed over to the lessee as evidence of his *title* to the leasehold interest. The other copy (the *counterpart*) is signed, sealed, and delivered by the lessee, and handed over to the lessor as evidence of his entitlement to the rent and to the performance of the covenants by the lessee. The counterpart requires a stamp (impressed by the Stamp Duty Branch of the Inland Revenue) of only five shillings; but the original must be stamped at the rate of 5*s.* for every £50 of the rent in leases not exceeding 7 years (and at higher rates in longer leases) if rent is £300 or more, besides 10*s.* per £50 of any premium from £5,500 upwards. No stamp duty is payable on rents up to £100 in short leases, or on a premium below £5,500.

Statutory Reforms in Law of Landlord and Tenant.—The above text on *Leaseholds and Leases* sets out the common law rules. But, at various times since 1920, Parliament has considerably amended and added to those rules—particularly to protect (1) tenants of trade, business and professional premises, and (2) tenants of dwellings of comparatively low rateable value.

Business Tenancies.—The Landlord and Tenant Act, 1954, Part II gives security of tenure to the tenant of most business premises. Fuller details are given on D33.

Residential Tenancies.—The Rent Act, 1965 restores the security of tenure which had been undermined by the 1957 Rent Act; full securty of tenure, accompanied by rent regulation, is given to tenants of low and moderate-rented properties (*i.e.*, of rateable value up to £400 in London and £200 elsewhere). It is now an offence for a landlord to evict a tenant from premises of any value whatever without a court order. This is now a permanent part of the law of Landlord and Tenant, and replaces the temporary provisions of the Protection from Eviction Act, 1964. The 1957 Rent Act allowed controlled rents to become decontrolled when the premises were re-let. The new Act stipulates that the vacation of a controlled property will result not in decontrol but in conversion on re-letting to a regulated tenancy under the new Act. For fuller details *see* D33–4.

3. Mortgages.—The word *mortgage* is Norman-French; its literal meaning is "dead pledge." The process of mortgaging land and buildings is roughly analogous to that of pawning a piece of jewellery as security for a loan of money—with the important difference that the land cannot, of course, be physically handed over to the lender (as can the jewellery) to be kept in his custody until the loan is repaid. But a pledge and a mortgage have this in common—that the parties intend no change of *ownership*; the *borrower* (the *mortgagor*) is and remains *owner* of the property *after*, as *well as before, the transaction*. In exchange for a loan of a certain sum, the *lender* (the mortgagee) temporarily enjoys a *charge* upon property worth (it may be) much more than that sum, as *security* for the repayment of the loan, with the stipulated interest, at the stipulated time. The *borrower* is still the property-*owner*.

Because of the essential immoveability of land, the mortgage transaction is effected by a *mortgage deed*, which sets out the terms on which the loan is granted. Generally speaking, the borrower (the mortgagor) is permitted to remain in *possession* of the mortgaged property unless and until he fails to pay an instalment of interest or to repay the capital when called upon, or unless and until he breaks some condition of the mortgage deed. In early times such failure was often the signal for the lender (the mortgagee) to oust him *permanently* from possession, and even to deprive him of *ownership* of the property. But the courts of equity (as we have seen, D4(2)) gradually evolved the rule that it was unconscionable for the lender to enrich himself, at a low cost to himself, from a transaction in which the intention of the parties was to *pledge the property temporarily* as a *security*, not to sell it permanently for a small sum. Hence was evolved the concept known as the *equity of redemption*—the rule that, even *after the legal date* fixed by the deed for repayment of the loan and for freeing the property from the mortgage, the borrower should still remain entitled to *redeem* the property (*i.e.*, to free it from the charge) by tendering to the lender the balance of the loan, with all interest and costs to date; and that the lender should thereupon be *bound* to give the borrower full and unfettered rights over the property, free from all the conditions of the mortgage, and in the same state as it was in originally. The lender (the mortgagee) must get no collateral (or additional) advantage of a permanent kind once the loan, interest, and costs were paid off; and this is still the law today.

The law, as stated above, has established the principle that the borrower who mortgages his freehold or leasehold interest, as security for a loan of money, shall not be deprived of his ownership, but shall retain such ownership after the execution of the mortgage deed. That deed is, in the first place, a *contract or agreement* under which the borrower promises to repay the loan to the lender, with interest at a certain rate, in one sum or by instalments, and meanwhile, for the lender's protection, to keep the property insured, in proper repair, and so forth. But that is not all; it is clearly important that the lender (the mortgagee) should, in addition, be granted an interest *in the property itself*—an interest which will enable him to take actual *possession* of the property, if need be, to enforce his rights, much as the pawnbroker has the right to *possession* (though not *ownership*) of the pledged article until the loan is repaid.

The Law of Property Act, 1925, devised a method of giving the lender (the mortgagee) a legal estate in the property while still preserving the rights of ownership of the borrower (the mortgagor). That Act provides that the grant of a mortgage of land, in *whatever form* it is effected, shall confer upon the lender (the mortgagee) *a term of years absolute*—*i.e.*, a *legal estate* in the *land itself*, which the mortgagee can deal with by sale, and which will be transmitted, as an interest in land, to his legal personal representatives upon his death. It is further provided that, on the final discharge of the mortgage (*i.e.*, the repayment of the loan, with all interest and expenses due to the mortgagee), that term of years shall *cease and be extinguished*, the mortgagor thereafter continuing to hold his freehold or leasehold estate *free from the mortgage term of years*, and free also from all the conditions of the mortgage deed.

In such a scheme it was necessary to distinguish the term of years conferred by the mortgage from any term of years absolute which might be or might have been conferred upon a lessee or underlessee by way of a lease or tenancy (see above, *Leaseholds*). For the purpose of such distinction the Act provides that, if the mortgagor's legal estate is a *freehold*, the mortgage deed confers upon the mortgagee a *term of 3000 years*, thus leaving to the mortgagor a legal *reversion* to commence after the expiration of that term (since the freehold estate is not limited to expire at any particular time). And if the mortgagor's legal estate is a *leasehold*, due to expire at the end of a fixed period, the mortgage deed confers upon the mortgagee a *term of years to expire ten days before* the leasehold term, thus again leaving the mortgagor with a legal reversion (in this case of ten days only).

In this way each party has a legal estate in the *land itself*, quite apart from the *contractual* rights and obligations in regard to the loan, which can be enforced by and against him *personally*. The mortgagor can sell his freehold *subject to the mortgage term* and the obligations of the mortgage deed; the mortgagee can *sell his mortgage term* with the benefit of the rights that go with it. The sale of a freehold (whether subject to a mortgage or not) is effected by a deed called a *conveyance*; the sale of a leasehold is effected by a deed called an *assignment*. The mortgage term can be dealt with in a deed called a *transfer of mortgage*. In every case the purchaser takes over the vendor's legal estate in the land, subject to, or with the benefit of, the personal obligations or rights in the original deed. In case of the death of the mortgagee or mortgagor, the legal estate in question, and the rights or obligations, are transmitted to his personal representatives.

Finally, it should be mentioned that, as an additional safeguard, the *title deeds* (evidencing the mortgagor's freehold or leasehold title) must be handed over to the mortgagee when the mortgage deed is executed, as part of the latter's security. The mortgagor must take care to get them back when he *redeems* the property by paying off the loan, interest, and expenses.

4. Title.—(a) *Evidence of title.*—Before freehold or leasehold property changes hands, it is the duty of the purchaser's solicitor to *investigate title*—*i.e.*, to satisfy himself that the vendor has a proper title himself and a proper right to convey or assign. Generally speaking, the purchaser's solicitor must go through the deeds (evidencing sales, transmissions on death, grants of leases, grants and redemptions of mortgages) for at least *thirty years back*; he must check every step in the *devolution of title* (*i.e.*, every change in ownership) and make *requisitions* (*i.e.*, demand explanations) on any point which is doubtful. This is still the system over the greater part of the country. No stamp duty is payable on conveyances up to £4,500; from £4,500 to £6,000 it is 10s. per cent; after that it rises to £1 per cent.

(b) *Registration of Title.*—With a view, however, to simplifying such procedure the Land Registration Acts have provided for a different system. In areas to which an Order in Council has made the system applicable, *registration of title* is *compulsory* upon any sale of freeholds, or of leaseholds having more than forty years to run. Under the Land Registration Act, 1966, this system is gradually being extended over the whole country. Registration is effected in the following way: the Government lawyers at H.M. Land Registry, in Lincolns Inn Fields, London, W.C.2, or some District Registry, investigate the title of every freehold or leasehold sold after the appropriate date, *once and for all*. If they are satisfied that it is in order, they register the owner as *registered proprietor* of the land with *absolute title* to his freehold or *good leasehold title* to his leasehold. (These kinds of titles indicate that the title is unexceptionable, but if there is a slight doubt the proprietor may be granted a *qualified title*; and if he is in possession of the land he may be granted a *possessory title*, which signifies little more than the fact of possession. The Chief Land Registrar is empowered, however, to convert both qualified and possessory titles into absolute or good leasehold titles, after fifteen years in the case of freeholds, and after ten years in the case of leaseholds.)

The Land Registry issues to the registered proprietor a *land certificate*, certifying (on behalf of the Government) that a registered title of the appropriate kind has been granted. In any further transactions relating to that particular land the purchaser's solicitor need not concern

himself with the original deeds save in exceptional cases; he can generally rely upon the certified statements made in the *land certificate*, on which the name of the new registered proprietor is entered by the Land Registry officials when a *transfer* in his favour, or the grant of a lease to him, is lodged at the Registry. There are appropriate sections in the land certificate for registration of a mortgage and the particulars of the mortgagee for the time being.

5. Joint Ownership.—If two or more persons are the owners of freehold or leasehold property, that does not mean that A owns one part of the land and buildings, and B and C other parts; the effect is that all of them *jointly own the whole*. (The analogy will be clear if the reader considers the case of a motor-car owned jointly by A, B, and C; clearly *all three own the entire car* between them; it cannot be said that A owns the engine, B the chassis, and C the body.) The Law of Property Act, 1925, recognises such joint ownership of land by means of a device known as a *trust for sale*. The respective rights of A, B, and C (equal or unequal) can be fully enforced only if and when the property is *sold* and the net proceeds of sale, in money, divided up in the proper proportions; and any or all of the joint owners can insist upon such sale or division for the purpose of obtaining their proper shares. But, while the property remains unsold, all the joint owners have rights according to the proportions of their shares: if, for example, the property is let, the net rents, after paying for repairs and other expenses, must be divided between them in those proportions. Up to four persons can jointly own a freehold or leasehold legal estate in land; if more than four are entitled to the *beneficial interest*, then four of their number only must hold the *legal* estate, and *equity* will enforce the *beneficial rights* of all against the legal owners. A purchaser from joint owners of the legal estate is concerned only with the latters' *legal title*; provided he hands over the purchase-money to them (not being less than two), or somebody authorised by them, *the purchaser is not responsible* for what they may do with that money. If those legal owners, from whom the purchaser buys, fail to pay over the proper shares to those *beneficially interested*, it is for the latter to enforce their rights against the vendors, who have sold the legal estate, by action in the Chancery Division, the guardian of equity. The purchaser's title to the land itself is not affected by the vendors' failure properly to carry out the terms of the trust for sale, so long as the *legal estate* has been properly transferred to him and he has paid the purchase-money to *not less than two* legal owners.

III. Property Other than Land (Moveables)

1. Chattels.—Chattels are *concrete things* which can be the subject of ownership, other than land or buildings, and other than objects so closely affixed to land or buildings that they are regarded as part thereof (*e.g.*, growing crops and trees, or "landlord's fixtures" built into some structure or so closely attached that they cannot be removed without serious damage to the structure).

In the ordinary way chattels can be *sold* or *given away* without any special legal formalities—merely by *physical transfer*—*i.e.*, by the owner handing them over to somebody else. If a chattel is to be *mortgaged* as security for a loan, the procedure differs according to whether the person pledging it (the borrower) is or is not to retain *possession* of the chattel. (His *ownership*, in either case is not disturbed.)

(*a*) If, as happens when an article is *pawned*, the borrower is not to keep the article in his possession, he hands it over to the pawnbroker, who hands him in exchange the agreed loan and a *pawn-ticket*. On production of the pawn-ticket, and the repayment of the loan with the stipulated interest, the borrower is entitled to receive the article back. (Provision is made by law for cases where the borrower defaults in payment, or where an unreasonable time elapses before he seeks to *redeem* what he has pledged.)

(*b*) If, however, the arrangement is that the *borrower* is to *retain possession* of the mortgaged article (as may happen if he borrows from a *moneylender* on the security of his furniture), then the borrower must execute and hand to the lender a document called a *bill of sale*. The law relating to such a document is extremely complex; but the most important provision is that the lender cannot enforce his rights unless he *registers* the bill of sale, at the Bankruptcy Court, in a register which any member of the public can inspect for a small charge. If then some member of the public desires to purchase the article from the person in whose possession it remains, but has reason to suspect that that person, though he may be the owner, has mortgaged it to a money-lender, it is open to the proposing purchaser to inspect the *register of bills of sale* to satisfy himself on the point. If he finds an entry against the owner's name, he will be wise not to proceed with the transaction. If he finds no such entry, and has no reason to believe the owner to be bankrupt, he can usually assume that there is nothing to prevent the person in possession from passing a good title to him. The proposed purchaser can also inspect the register of bankruptcies in order to see whether the vendor has the right to sell (*see* D8(1)).

2. Things in Action.—These (*see* D16(1)) are *intangible rights* which can be owned and dealt with but, because of their abstract nature, cannot be *physically* transferred. If Brown owes Jones £50, Jones (the creditor) can transfer to Robinson the right to collect the £50 from Brown. Jones does this by a document called an *assignment* of the debt and (most important) by giving *written notice* to Brown (the debtor) that Robinson is now the creditor instead of Jones.

Similarly, if Jones owns ten shares in Brown & Co., Ltd., Jones will hold a *share certificate*—*i.e.*, a document certifying the amount of his shareholding. He has certain rights in the company, but these depend upon the company's *memorandum and articles* (D8(2)) and upon the *registration* of his name in the company's register of shareholders. The share certificate is only *evidence* of his rights—it is not in itself a piece of property, and the physical handing over of the certificate will effect nothing unless Jones executes a *share transfer* in Robinson's favour and Robinson sends it to the company for registration, together with the old share certificate in Jones's name. After *registration* of Robinson's name, the company will destroy the old certificate and issue a fresh one to him.

Again, if Jones has insured his life with the Brown Life Assurance Society, he will have received a *policy* which is *evidence* of the right of his legal personal representatives to be paid £1000 on Jones' death. If Jones wishes, during his lifetime, to transfer that benefit to Robinson, he can do so, but it will not suffice for him merely to hand Robinson the policy. To transfer the *rights* under the policy he must execute an *assignment* in which it is stated that Jones, being the policy-holder and entitled to certain rights thereunder, now *assigns* those rights to Robinson. But no transfer of those rights will have been effected until Robinson has *notified* the Assurance Society of what has been done and sent it the policy and the assignment for *registration* in its books.

These examples illustrate the principle, set out in the Law of Property Act, 1925, that an *unconditional assignment*, in writing, by a person (the assignor) entitled to any debt or other thing in action, in favour of another person (the assignee), if *notice in writing* is given *to the debtor* or other person on whom the obligation rests (in the above examples, to Brown, the Company, and the Assurance Society), shall entitle the assignee to all the assignor's rights, including the right to enforce those rights by action in the Courts, without calling upon the co-operation of the assignor in whom the right to the debt, or other thing in action, was originally vested.

C. FURTHER DETAIL ON SOME BRANCHES OF THE LAW

DIVORCE AND OTHER MATRIMONIAL CAUSES

1. HISTORICAL SKETCH

The anomalies in this branch of the Law of England, and the legalistic attitude of the Courts to the subject, are principally due to historical reasons. For centuries the Church of Rome was the supreme ecclesiastical authority, and the law of that Church (Canon Law) applied to *matrimonial causes*—that is to say, disputes relating to any marriage and the mutual rights and duties of the spouses. Marriage was *indissoluble*—that is, there was no such thing as divorce in the modern sense of *breaking the legal tie*. But the Ecclesiastical Courts, which alone administered the matrimonial law before 1858, might for certain reasons grant a *decree of nullity* (a declaration that a particular "marriage" was null and void). In other cases they might grant what is now called a *legal separation* (known, in those days as a "divorce *a mensa et thoro*," *i.e.* banishment from bed and board); this latter decree, however, *did not dissolve* the marriage bond, but merely gave judicial sanction to the spouses' living apart from each other, and regulated the terms of the separation. After the Reformation the Ecclesiastical Courts continued to deal with matrimonial causes on the same legal principles as before.

As a result of the Acts of Supremacy passed in the reigns of Henry VIII and Elizabeth I, the Sovereign was declared to be the supreme governor of the Realm in all spiritual and ecclesiastical, as well as temporal, causes. This royal supremacy, exercised constitutionally through Parliament, was part of the law of the land; since there was no limitation upon the power of Parliament (*see* D5), special Acts were passed, from time to time, to effect that which neither the Ecclesiastical nor the Civil Courts then had jurisdiction to do, *viz.*, to break the marriage tie itself. A divorce of this kind, known as "divorce *a vinculo matrimonii*" (a divorce from the marriage bond) was rare, for the procedure was cumbersome and expensive. Except by the passing of a special Act of Parliament, there was no means of getting a marriage dissolved before the year 1858.

The Matrimonial Causes Act, 1857, transferred the jurisdiction in matrimonial matters from the Ecclesiastical Courts to the new Civil "Court for Divorce and Matrimonial Causes"; but perpetuated the old ecclesiastical practice with regard to nullity suits and judicial separation (formerly known as "divorce *a mensa et thoro*"). Apart from this rearrangement, the Act took the revolutionary step of conferring upon this Court a new judicial power—that of granting a *divorce in the modern sense* of a complete *dissolution of marriage*. As we have seen (D5), the Supreme Court of Judicature Act, 1873, and subsequent legislation, set up one single High Court of Justice, of which the Probate, Divorce, and Admiralty Division formed part, taking over (with other work) the jurisdiction which had been conferred in 1857 upon the "Court for Divorce and Matrimonial Causes." This jurisdiction remains in the hands of the Probate, Divorce and Admiralty Division to-day. Great changes have been effected *by statute* (notably in 1923, 1925, 1937, 1950, 1963, 1965, and 1967) extending the grounds for divorce and the jurisdiction of the Court; but in the *interpretation and adaptation of principles* the great body of *case law* (*see* D4), which enshrined the principles and practice of the old Ecclesiastical Courts, is not without its influence to-day. The principles of equity (*see* D4), however, have not modified the strict legalism of this branch of the law; *equity has no application to the law of matrimonial causes* (except for resort to *injunction* (*see* D11) and for the protection of the wife's person or property).

2. POWERS OF INFERIOR COURTS—SUMMARY JURISDICTION

Concurrently with the jurisdiction of the Divorce Division of the High Court, Magistrates' Courts now have power (Matrimonial Proceedings (Magistrates' Courts) Act, 1960, and Rules made thereunder) to grant relief (by a *matrimonial order*) to *either spouse* (the *complainant*) in certain cases of misconduct on the part of the other spouse (the *defendant*). The procedure is simpler, quicker, and cheaper than in the High Court. A Magistrates' Court may grant a matrimonial order if such order provides (*a*) that the complainant shall be no longer bound to cohabit with the defendant that has the same effect as a High Court decree of judicial separation (*see* D28). A Magistrates' Court may also provide (*b*) that the husband shall pay the wife (or (*c*) where the husband's earning capacity is impaired by age, illness, mental or physical disablement, that the wife shall pay the husband) weekly maintenance up to £7 10*s.* plus (*h*) up to 50*s.* for each dependant child; (*d*) the child's custody (up to 16 years of age) may be granted to the complainant or (*e*) to a county council or county borough council or (in special circumstances) (*f*) such child may be ordered to be placed under the supervision of an independent person (such as a probation officer) and (*g*) access to the child may be granted to either spouse or to any parent. (There are special provisions relating to (*d*), (*e*) and (*f*).)

Either spouse may apply for relief on the ground that the defendant—

(1) has *deserted* the complainant;

(2) has been guilty of *persistent cruelty* to the complainant or an infant child of the complainant or of the family;

(3) has been convicted (i) on indictment (*i.e.*, by a jury) of any *assault* on the complainant, or (ii) by a Magistrates' Court of certain offences (involving imprisonment for not less than one month) *against the person* of the complainant, or (iii) of a *sexual offence* (or an attempt thereat) against an infant child of either spouse who is a child of the family;

(4) has committed *adultery*;

(5) while knowingly suffering from *venereal disease*, has insisted upon sexual intercourse with the complainant, or permitted such intercourse without the complainant being aware of such disease;

(6) is a *habitual drunkard* or a *drug addict*;

(7) being the *husband*, has compelled the *wife*, or led her, *to submit to prostitution*;

(8) being the *husband*, has wilfully *neglected to provide reasonable maintenance* for the wife or any dependant child of the family;

(9) being the *wife* (*in case* (c) *above*) has *wilfully neglected to provide*, or make a reasonable contribution to, *reasonable maintenance* for the husband or any dependant child of the family, having regard to any resources of the spouses.

A Magistrates' Court has jurisdiction to hear any such complaint *if either spouse ordinarily resides in the Court district*, or (except in (3) above) *if the cause of complaint arose in that district*, or (in case (3)) if the offence or attempt arose in that district. Jurisdiction is also exercisable *if the complainant resides in England* and the parties last resided together in England (even if the defendant now resides in Scotland or Northern Ireland), or *if the defendant resides in England* though the complainant resides in Scotland or Northern Ireland. The Court may order the *costs* of the application to be paid by either party.

The general rule is that a complaint under (4) above must be made *within six months* of the date when the act of adultery first became known to the complainant. A complaint on any other grounds must generally be made within six months of the ground of the complaint arising, unless the complainant was abroad at the time; but this time limit does not apply to such continuing offences as desertion (see below) or wilful neglect to maintain.

These "domestic proceedings," as they are termed, may be heard before one stipendiary (legally qualified magistrate) or not more than three justices of the peace, including, so far as practicable, both a man and a woman. The *hearing* is *in private*, the public being excluded, and newspapers are prohibited from publishing details: "domestic proceedings" must be dealt with separately from other matters, and reports from probation officers may be received on the subject of any attempted reconciliation or on the means of the parties. In general, the magistrates should apply the same general principles as are applied in the Divorce Division; lay justices of the peace are advised on the law by their legally qualified clerk.

A *Magistrates' Court*, however, has *no power to grant a divorce* or *to annul a marriage;* the jurisdiction to make such a decree is in the hands of the Divorce Division of the High Court of Justice and, since 1967, of certain County Courts in undefended cases.

An order may be enforced by committing the defendant to prison if his failure to comply with the order is shown to be due to wilful refusal or culpable neglect. (*See also* **D32(1)**).

No order is enforceable while a wife is *residing with her husband*, and *no order* may be made on the application of a complainant where it is proved that he or she has been *guilty of adultery*, unless the defendant condoned or connived at (see below), or by his wilful neglect or misconduct conduced to (*i.e.*, tended to lead to), the adultery. An *order already granted* will be *discharged* (i.e., its effect will be terminated) on *proof of the complainant's adultery*, or *on* proof that the spouses *voluntarily resumed cohabitation*.

If a matrimonial cause is pending in the Divorce Division of the High Court, no application for a separation or maintenance order ought to be dealt with by a Magistrates' Court. And a Magistrates' Court may refuse to make any order when the suit in question would, in its opinion, be more conveniently dealt with by the Divorce Division.

Appeals. A Magistrates' Court has power "to state a case," upon *a point of law* (not a question of *fact*) arising on the application, for decision by a Divisional Court consisting of two or more judges of the Divorce Division. And an appeal from a Divisional Court lies to the Court of Appeal, by leave of either the former or the latter.

3. MATRIMONIAL CAUSES in the HIGH COURT and UNDEFENDED DIVORCE CASES in DESIGNATED COUNTY COURTS

(1) Constitution of the Courts

The President of the Probate, Divorce, and Admiralty Division and not less than three other High Court Judges attached to that Division are the permanent judges for Matrimonial Causes. They sit both at the Royal Courts of Justice in London and at Assizes. Certain subsidiary duties are performed by the seven Registrars of the Principal Registry of the Division at Somerset House, and by District Registrars in the principal cities of England and Wales. The Matrimonial Causes Act, 1967, permits designated County Courts to grant divorces in undefended cases.

(2) Practice and Procedure

In contrast to "domestic proceedings" in Magistrates' Courts, the *Judges* of the Divorce Division sit normally in *open court*, though they have power to sit *in camera* (in private) where the ends of justice so require. In *nullity proceedings*, however, it is provided by statute that evidence on the question of *sexual incapacity* must be heard *in camera* unless the Judge is satisfied that the ends of justice require such evidence to be heard in open court. Press publicity is limited by statute to certain matters, and the publication of indecent matter may give rise to prosecution, in any matrimonial proceedings.

In general, practice and procedure in the Divorce Division and designated County Courts are governed by statute, by rules of Court framed by a judicial committee under statutory authority, and by the principles and practice of the old Ecclesiastical Courts—except in proceedings for dissolution of marriage, which the old Courts could not entertain (*see* **D24(1)**). Solicitors, as well as Counsel, can be advocates in County Court hearings.

(3) Relief and Grounds for Relief

(a)—Nullity of Marriage. The High Court has power to declare a "marriage" null and void in two main classes of case:

(i) "*Marriages*" *Void from their Inception*—*i.e.*, where one of the parties had *another husband or wife living* at the time of the ceremony; where there was a *mistake* as to the *nature* of the ceremony, or the *identity* of the other party; where one party had been declared of *unsound mind* and was detained as a lunatic at the time of the ceremony; where the parties were within the *prohibited degrees* of relationship (*e.g.*, brother and sister, or uncle and niece); or where the *ceremony was not in due form*, or was a mock "marriage."

(ii) *Marriages which are Voidable*—*i.e.*, which stand good unless and until one party or the other ("the Petitioner") successfully petitions the Court for annulment—*i.e.*, where either party was sexually *impotent at the date of the ceremony*; where either party has wilfully *refused to consummate* the marriage; where the marriage was *induced by threats* or fear or duress (*i.e.*, force), or where one spouse was *intoxicated* at the time of the ceremony.

The Act of 1965 (re-enacting in part the Act of 1950) has (somewhat illogically) added certain other grounds: (*a*) where either party was, at the time of the ceremony, in fact of *unsound mind* but had not been declared so, or was then a *mental defective*, or then subject to recurrent fits of *insanity or epilepsy*; (*b*) where the other spouse was, at the time of the marriage, suffering from *venereal disease* in a communicable form; and (*c*) where the wife was, at the time of the marriage, *pregnant by some person* other than the petitioning husband. But in these last cases (*a*), (*b*), and (*c*) the Court must not grant a decree unless it is satisfied that the petitioner was, at the time of the marriage, ignorant of the facts alleged; that the proceedings were instituted within a year of the marriage, and that there has been no sexual intercourse between the parties, with the consent of the petitioner, since he or she discovered that there were grounds for a decree of nullity.

Where a "marriage" is *void* (see above) the law regards it as *never having taken place* at all. Where it is *voidable*, the decree *annuls the marriage retrospectively* from its inception; but certain transactions between the parties while they actually remained married are validated, and the Court has power to order maintenance for the woman; and *any child* who would in the normal way have been

the legitimate child of the parties *remains legitimate*, notwithstanding the annulment.

Sterility—*i.e.*, inability to produce children—is not, in itself, a ground for annulment of the marriage. If the *impotence* of one spouse appears to be *curable* without danger the Court may, before pronouncing a decree, require that opportunity for *cure* be first given. If he or she *refuses to undergo examination or treatment* the Court may infer, after hearing the other party's evidence, that impotence exists. The petitioning husband or wife may ask for a nullity decree on the ground of *his or her own impotence*, provided he or she did not know of it at the time of the marriage. And there have been recent cases in which *both partners* have been granted decrees.

Apart from the one-year rule (mentioned in the last paragraph but two) in certain cases, delay (however long) in petitioning for nullity is no bar to the grant of a decree.

(b) Divorce.—(i) *Its Nature and Purpose.*—Divorce means the *breaking of the legal tie* of marriage by a decree of the Court. There is much controversy on the subject, some of it ill-informed, and much of it tinged with emotion and prejudice. It is not the purpose of this sub-section to take sides in the controversy, but (so far as possible) to remove misconceptions and to set out the various points of view.

We have to start by facing the unpalatable truth that *some marriages do break down* in fact. The symptoms of break-down may be continual strife, and sometimes violence, between the spouses, so long as they continue to live together; or there may be an actual breaking-up of the home because one or the other finds the situation intolerable and leaves. The function of the law should be to deal with this state of affairs as best it can, paying due regard: (*a*) to the interests of the children (if any), who are innocent parties to the dispute: (*b*) to the interests of the spouses and of any third party involved; (*c*) to the interests of public decency and the safeguarding of family life generally.

The problem has suffered from over-simplification by the Press and the protagonists on either side. Sometimes it is represented (quite inaccurately) as a conflict between those who want divorce to be "easier" or "harder" to obtain. Sometimes it is said that divorce as an institution is "causing the break-up of family life." This is a superficial view, ignoring the true nature of the problem, and confusing effect with cause. Happily married couples do not seek divorce. Divorce is the drastic *remedy* provided by the civil law in the case of a marriage which has already *broken down in fact*; the availability of divorce does not bring about the break-down, any more than the availability of surgical treatment can be said to bring about ill-health. A marriage may break down—that is to say, the "kernel" of the marriage, the mutual respect and affection between the spouses, has withered away; only an empty shell—the legal tie—continues to subsist between them. How should this situation be dealt with by law?

It is common ground, among both the upholders of the orthodox view and those who advocate reform, first, that every possible effort should be made, by private individuals and public institutions, to effect a reconciliation, if at all possible. Such efforts are favoured by the law, and excellent work is done to this end by religious organisations, medical men, probation officers, lawyers, and such institutions as the Marriage Guidance Council.

Secondly, it is common ground that, if such efforts are unsuccessful and the *breach proves irreparable* in fact, the interests of the children (if any) should be paramount, and no pains should be spared to secure their proper care and maintenance. This is laid down by law; the Judge in a matrimonial cause may take the initiative in providing for the custody, maintenance, and education of the children, or for placing them under the care of the Chancery Division (*see* D5); whether the initiative is taken by the Judge or by one of the parents, the welfare of the children is the *paramount consideration*, irrespective of the rights and wrongs as between the parents. Nobody will deny that, once the marriage has broken down *in fact*, the children will suffer to some extent; but it does not follow that they would suffer less if the legal tie between the parents were preserved, or if the home, with its atmosphere of strife, and perhaps of violence, were kept together at all costs—even assuming such a thing were possible. A divorce may not be granted unless the Judge is satisfied that all possible arrangements have been made for the care and upbringing of the children (D31).

It is at this point that the main controversy begins. Where the "kernel" of the marriage has withered away, should the "shell"—the legal tie—be preserved or discarded? And if discarded, then in what circumstances and on what conditions? The present answer of the law is a not altogether satisfactory compromise.

The Christian Churches declare that marriage is not merely a civil institution but a religious sacrament, and the Roman Church regards it as indissoluble. This last is a matter of religious dogma and belief; not a question for rational argument. It is a view as deserving of respect as any other; but, as we have seen, it was abandoned by Parliament a century ago, and is unlikely to be reinstated in the civil law of England. Many churchmen regard this view as binding on their consciences, but it is no longer the law of the land. For better or worse, a marriage can now be legally dissolved, leaving each party free to contract another union if he or she so desires. On what basis, then, ought such dissolution to be granted?

This is the second stage of the controversy. The conventional view, the attitude of the present law, is that a decree of divorce can, and ought to, be granted solely as a result of some *matrimonial misconduct* by the "guilty" party, entitling the "innocent" party—and only the "innocent" party—to go to the Court for relief. According to this view, the decree of divorce (though in law a merely civil remedy) is regarded virtually as in the nature of a *penalty* upon the "guilty" party for his or her wrongdoing—a view that has survived from biblical times. The reformers consider this an anachronism and an anomaly, pointing out: (*a*) that in those times (as is the case under Islamic law to-day) it was only the husband who could divorce his wife (not *vice versa*)—a step which was then a very severe punishment, since divorce meant, for the woman, disgrace, degradation, and poverty; whereas there is to-day little or no economic penalty or social stigma upon the "guilty" spouse, who is frequently no less—and often more—desirous than the "innocent" spouse of obtaining his or her freedom. The reformers further emphasise: (*b*) that the matrimonial law has never pretended to identify itself wholly with the doctrines of the Church; for example, the Book of Common Prayer declares, of marriage, that "first, it was ordained for the procreation of children"; yet not even the Ecclesiastical Courts went so far as to annul a deliberately childless marriage, and under the present law a refusal to have children is not a matrimonial offence and involves no penalty. Finally, (*c*) the reformist view is that the essence of the married state—the "kernel"—is the mutual respect and affection between the spouses; once that "kernel" has withered away and the marriage has *irretrievably broken down in fact*, the preservation of the legal tie is a mere pretence; the breaking of that legal tie, from the point of view of public decency, should be regarded as the necessary and proper result of the break-down of the essence of the marriage, or the break-up of the marital home. Under the present system, a refusal by the "innocent" party to take proceedings for divorce, however malicious his or her motive

for such refusal, cannot be questioned, and this makes for irregular unions and illegitimate births; on the other hand, the law's insistence that there must be an "innocent" and a "guilty" party inevitably induces two spouses, who find their union intolerable, to resort to unworthy subterfuges; under a more rational system (such as obtains, for example, in the Scandinavian states) both parties might amicably join forces to have the marriage dissolved, once it was quite clear that reconciliation was out of the question.

The reformist view has gradually gained ground. First, a Committee appointed by the Archbishop of Canterbury reported in favour of the "reformist" view (D26(2)) at the end of July 1966; and the Law Commission (D5(2)) has supported its recommendations, but wishes to avoid long Court investigations into "irretrievable breakdown." It recommends that adultery, cruelty, and desertion, and even consensual separation, be regarded as *symptoms* and *evidence* of breakdown. The Lord Chancellor is also in favour of these changes, and also several Nonconformist Church bodies. The Law is likely to be drastically altered soon; meanwhile we can only state the *present law*. But the Courts have already begun to avoid keeping hopeless marriages in being, subject to *reconciliation efforts* before decree.

(ii) *Grounds for Divorce.* The *Petitioner* (*i.e.*, the husband or wife who is *asking the Court for a divorce* against the other spouse) may present a petition on the ground that the *Respondent* (the other spouse):

(*a*) has since the celebration of the marriage *committed adultery*;

(*b*) has *deserted* the Petitioner *without cause* for at least *three years* preceding the presentation of the petition; but, by the Act of 1965, the 3 years' period is not to take account of any one period of 3 months during which the spouses came together again with a view to reconciliation.

(*c*) has since the celebration of the marriage treated the Petitioner with *cruelty*; or

(*d*) is *incurably of unsound mind* and has been *continuously under care and treatment for at least five years* immediately preceding the presentation of the petition. (*See also* D31(2).)

Further, a *wife* may petition for divorce on the grounds that:

(*e*) her husband has, since the celebration of the marriage, been guilty of *rape, sodomy,* or *bestiality.*

Finally, to cover those cases where one of the spouses has disappeared and not been heard of for many years:

(*f*) any married person who alleges that reasonable grounds exist for *supposing the other party to be dead* may petition the Court *to have it presumed* that the other party is dead and *to have the marriage dissolved.*

No petition for divorce on any ground may be presented *until the expiration of three years* from the date of the marriage, unless a Judge is satisfied that there is a case of *exceptional hardship* upon the Petitioner or *exceptional depravity* on the part of the Respondent. Whether there is such a case is a question for the Judge's discretion upon the evidence brought before him.

As to the above-mentioned grounds for divorce:

(a) *Adultery* means *voluntary sexual intercourse* between a husband and a woman who is not his wife, or between a wife and a man who is not her husband. (A woman who has been raped—*i.e.*, forced to have intercourse with another man against her will—is not guilty of adultery.) For obvious reasons, *direct evidence* of the act of adultery is rare, and the Court may infer from circumstantial evidence that adultery has taken place.

(b) *Desertion* means, primarily, the *intentional permanent abandonment*, by one spouse of the other, *without that other's consent*, and *without reasonable cause.* Therefore there is *no desertion* in such cases (for example) as: (i) where a husband *cannot* live with his wife because he is serving a sentence of imprisonment; (ii) where a husband leaves his wife for a *short time* for necessary business or family reasons, *intending to return to her*; (iii) while a *separation continues with the consent of both parties*; (iv) where the spouse who abandoned the other had *just cause* to do so; (v) any one period of 3 months cohabitation with a view to reconciliation does not break the period of desertion.

Indeed, in certain cases under (iv) the doctrine known as constructive desertion may apply *against the other spouse*, if he or she has (figuratively speaking) *driven the first spouse away. Constructive desertion* means, not "desertion" in the literal sense of walking out of the matrimonial home, but conduct on the part of a husband which is intended to force, and virtually forces, his wife to leave him, or *vice versa.* Thus, if a husband brings his mistress to live with him in the matrimonial home and, as a result, his wife leaves him, not only is the wife innocent of desertion in the legal sense, but the husband is himself guilty of constructive desertion; it will be presumed against him that he intended to terminate his marital association, and he has in fact *carried out that intention.* Such a case illustrates the principle that there are *two elements* in the legal meaning of *desertion*—the *act* of physical separation and the *intention* to bring normal married life to an end.

In order to bring about desertion it is not necessary that the spouses should cease to live under the same roof; "desertion is not withdrawal from a place, but from a state of things." It is sufficient that the Respondent (the "guilty" spouse) has withdrawn from, or forced the other to withdraw from, *cohabitation*—*i.e.*, from sharing a common "home" in the full sense of the word. A wife "deserts" her husband if she refuses (against his will) to share his room, to take her meals with him, and to perform the usual duties of a wife. On the other hand, the mere refusal of sexual intercourse, in itself alone, does not amount to desertion, though it *may amount to cruelty* (D28) if it has broken or is likely to break the health or spirit of the Petitioner.

It should also be noted that desertion is not a single act but a continuous state of affairs. The Petitioner must prove *that desertion without cause continued* during the entire period of *three years* required by law as the basis of a divorce petition. Although (see above) desertion in the legal sense must be *without the consent* of the petitioning spouse, recent judicial decisions have tended to dispense with the requirement that the deserted party must prove a *continuing desire* for the deserting party to return, and a *continuing willingness* to receive and reinstate the deserting party, during the *entire period of three years* preceding the commencement of proceedings; in other words, once the latter party's *original act and intention of deserting* has been proved, that intention is *presumed to have continued*, unless there is evidence to the contrary. (But see above (b)(v).) But any kind of *agreed separation* is fatal to the case, whether the agreement be in writing, by word of mouth, or implied by conduct. An agreement, however, by a husband, who is *already living apart* from his wife, to *maintain* her and the children does not constitute a separation by agreement, unless there is evidence that the *wife, actually consented* to his leaving her. A *matrimonial order* made by a Magistrates' Court (*see* (D24(2)) does not necessarily prevent the period of desertion from running, unless the order contains a clause, deliberately inserted, to the effect that "the parties shall no

longer be bound to cohabit." And the insertion of such a clause is rare.

If the deserting party makes an *offer to return* to the matrimonial home it is the duty of the other party to receive him (or her) back and to resume normal married life together, *if the offer to return is genuine* and if no other matrimonial offence (such as adultery or cruelty) has been committed by the deserting party. Whether such an offer is "genuine" is a question of fact, to be decided on all the evidence; it will generally be a wise safeguard for a deserted party who receives such an offer to *take legal advice* before accepting or rejecting it: for if rejection of the offer subsequently proves to have been unjustified, he (or she) may become the deserting party. This situation, again, arises from the legal view that "desertion" consists of two elements—the *act* and the *intention* of deserting. (*See also* (b) (v), above).

An *honest and reasonable belief*, by one spouse, that the other spouse has committed, or is committing, adultery, if such a belief is induced by the other spouse's conduct, may be "just cause" for the first spouse to refuse cohabitation, and prevent him (or her) from being regarded as the deserting party.

(c) *Cruelty* is not defined by statute, but has been decided, in reported cases, to mean conduct causing danger to life, limb, or bodily or mental health, or giving rise to a reasonable apprehension of such danger. (The term "Mental Cruelty" is unknown to English law; but there may be *cruelty* in the legal sense *without physical violence*.) The Courts have refused to commit themselves to a comprehensive definition; *every case* must be considered on its *own facts* in the light of the whole history of the marriage. One single act, even of violence, can seldom be regarded as "cruelty"; but the conduct complained of must be of a *grievous nature*—not mere conduct which (however reprehensible) may be regarded as "part of the wear and tear of married life." In order to constitute cruelty, the conduct must be understood to be likely to break the latter's *health or spirit*. An *insane person*, who does not understand the nature and quality of his acts, and so cannot form the necessary "intention" (*see* D8), *can be guilty of cruelty* if he was warned of the probable result: for it is no longer necessary for the petitioner to prove that the respondent *intended* to be cruel or was aiming or directing his conduct against the petitioner.

Drunkenness, in itself, is *not* cruelty: but if it is so *persistent*, or its effects so inevitably *distressing* to the other spouse, as to *threaten his or her health*, it may amount to cruelty. Similar considerations apply to persistent refusal of sexual intercourse, excessive sexual demands, or sexual malpractices either forced upon the other spouse or committed with third parties.

A *divorce petition* based wholly or partly on cruelty must *set out specifically the acts* complained of, evidence of which is to be given at the trial. (This ensures that the Respondent knows the details of the case he has to meet.)

(e) **Restitution of Conjugal Rights.**—Either spouse may petition the Court for such a decree where the other spouse has "wrongfully withdrawn from cohabitation" (see above). *Willingness to return* to cohabitation, *if genuine*, or *proof of just cause* (see above) for refusal are good defences. If the petition succeeds, and the Court orders the erring spouse to return, his or her *non-compliance* with the order *will not lead to enforcement* by arrest or otherwise; but it will (so to speak) fix upon him or her responsibility for the separation, and *establish* his or her status as the deserting party (see above). And *non-compliance* with a restitution decree is in itself *a ground* for the other party to petition for a decree of *judicial separation* (see below).

(d) **Judicial Separation.**—A petition for this form of relief may be presented by either spouse on the ground last mentioned in the foregoing paragraph, or on any of the grounds for which a divorce petition (see above) might have been presented. The *effect of the decree* (as in the case of a similar order made by a Magistrates' Court) is that the Petitioner is *no longer bound to cohabit* with the Respondent, and cannot therefore be regarded as a deserting party. (The *legal bond* of marriage *remains in force*; the procedure is therefore often employed by a spouse who does not desire divorce, perhaps for reasons of conscience, perhaps merely so as not to allow the other party freedom to marry somebody else.) It is, however, open to a Petitioner, who has obtained a decree of judicial separation, to petition for divorce, on the same facts, at a later date—*provided that three years have elapsed* since the date of the marriage (*see* D27(1)).

Bars to Relief.—(1) *Absolute Bars.*—It is, by statute, the duty of the Court to investigate, so far as it reasonably can, the facts alleged in any petition for divorce or judicial separation, and to inquire whether there has been any *connivance* or *condonation* on the part of the Petitioner, and whether any *collusion* exists between the parties. *The Court must dismiss* the petition, and *refuse a decree, even in an undefended suit, unless* it is satisfied: (*a*) that the *Petitioner has proved his or her case*; (*b*) that the Petitioner has not been *accessory to or connived at* the adultery (if any) of the other party; (*c*) that the Petitioner has not *condoned* the adultery (if any) or the cruelty (if any) of the other party.

(a) *The Petitioner must prove the case*—that is to say, satisfy the Court that there are *proper grounds* for a decree *according to law*; there is no such thing, in suits for divorce and judicial separation, as judgment by consent, by admission, or in default of defence (as is possible, for example, in actions for breach of contract (D11) and tort (D12)). *In matrimonial suits* the *State*, and not merely the parties themselves, must see that the provisions of the law are *strictly observed*.

(b) *There must be no connivance*—that is to say, the Petitioner must not have intended *to promote or encourage or provide opportunity for* the commencement or the continuance of the Respondent's adultery. Merely *keeping watch upon a suspected spouse*, for the purpose of obtaining evidence, is not necessarily connivance; there must be active *encouragement or acquiescence*—wilfully "shutting one's eyes" to what is going on or likely to take place. (But, if a spouse who has connived at his partner's adultery repents and withdraws his acquiescence, the connivance may be regarded as "spent," and no longer be a bar to divorce.)

(c) *There must be no condonation* of adultery or cruelty—that is to say, *forgiveness* of all such acts as are known to, or suspected by, the injured spouse, and the restoration of normal marital relations with the offending spouse. ("Forgiveness" means forgiveness *on condition* that there shall be *no further matrimonial offence*.) Condonation may be by words or conduct. The Petitioner *cannot obtain a decree* on the ground of any offence or offences which he or she has *condoned*, except in case of *revival*. But adultery or cruelty shall not (now) be deemed to have been condoned merely because of a resumption of cohabitation (for not more than three months) with a view to reconciliation.

Revival—If, subsequent to the condonation, the offending spouse again commits some matrimonial offence or offences, the former offence or offences, other than adultery, are *revived*—*i.e.*, the effect of the forgiveness and restoration (see above) is cancelled, and the former offence or offences will again afford a ground for divorce or judicial separa-

tion. It does not matter whether or not the new offence is of the same nature as the old; condoned cruelty will be revived by new acts of cruelty or desertion; condoned cruelty will be revived by a new act of adultery, and so forth. But, by the Act of 1965, adultery, once condoned, cannot be revived.

(2) *Discretionary Bars*—(*a*) *There may be an agreement* or *bargain* between the parties (whether for financial consideration or otherwise) that the Petitioner will commence or conduct a suit for divorce or judicial separation, or that the Respondent will not defend such a suit. There is *collusion* if one party *requests or suggests* that the other *should commit adultery* in order to provide evidence for a divorce, and the other party *accedes* to the request or suggestion. But it is not necessarily collusion for the Petitioner, knowing that *adultery has already been committed*, to ask the other party *for details or for evidence* on which the Petitioner can act. The Court regards financial arrangements between the parties with suspicion, if they are entered into *before the suit is commenced*, and it will carefully investigate such arrangements, and it has a discretion, under the 1965 Act, to permit such financial arrangements if they are fully disclosed. Once the petition has been filed, there is no objection to discussion, between the parties or their advisers, of necessary financial arrangements as to alimony or maintenance (*see* D30(1)) or the disposal of the matrimonial home.

(*b*) Apart from connivance and condonation, either of which (as we have seen) is a *bar* to the granting of a decree, the *Court has a discretion either to refuse or to grant* a decree of divorce or judicial separation, according to circumstances, if it finds that the *Petitioner* has himself (or herself): (*i*) been *guilty of adultery* during the marriage; (*ii*) *shown unreasonable delay* in presenting or prosecuting the petition; or (*iii*) been guilty of cruelty, or desertion without reasonable cause, *before* the Respondent's acts of adultery or cruelty on which the petition is based. The Court has a similar *discretion*, where the ground for the petition is *adultery, desertion*, or *unsoundness of mind*, either to refuse or to grant a decree to a *Petitioner* who has (*iv*) been guilty of such *wilful neglect or misconduct* as has conduced to (*i.e.*, helped to bring about) the Respondent's adultery, desertion, or unsoundness of mind; and (*v*), by the 1965 Act, it has a discretion to grant a divorce where there has been an agreement between the parties, if full disclosure is made (*see* (2) (a) above).

In a case where each party is asking for a divorce against the other, each admitting his (and her) own misconduct and asking the Court to exercise its discretion in his (and her) favour, the *Court may exercise its discretion in favour of both* and dissolve the marriage. The same applies to *nullity*

In case (*i*) above, where the *Petitioner* has himself (or herself) been *guilty of adultery*, it is the Petitioner's duty to lodge in the Divorce Registry a *discretion statement*—*i.e.*, a written statement in a sealed envelope (to be opened by the Judge at the hearing) admitting the facts and explaining the circumstances of his (or her) adultery. The *petition* in such a case must *contain a clause praying the Court* "to exercise its discretion in the Petitioner's favour." The Petitioner's *own* adultery, admitted in open Court, may be the only such evidence available.

Decree Nisi and Decree Absolute.—When the case comes on for trial the Judge will hear the *evidence of the Petitioner* and his or her witnesses, *and legal argument* on his or her behalf; *if the case is defended* by the Respondent spouse, or by the Co-respondent (*i.e.*, any *man* accused, in the petition, of adultery with a Respondent *wife*), or by any *woman named* in the petition as having committed adultery with a Respondent *husband*, the Judge will hear their evidence and legal argument on their behalf. The Judge, if not satisfied on points (*a*), (*b*), and (*c*), (D28–9) in a case of divorce or judicial separation, must *dismiss the petition*, in which event the married status of the parties will remain unchanged. (But see D27(1).) If the Judge is satisfied on the points mentioned he will, in a suit for *judicial separation*, pronounce a *final decree*; in a *suit for restitution of conjugal rights* he will *order* the deserting spouse *to return to cohabitation* (the effect of the decree and the order is described above, D28(1)).

In a suit for *nullity* or *divorce*, the Judge will pronounce a decree *nisi*—*i.e.*, an order that the marriage is to be *annulled* or *dissolved* unless (*nisi*), before that event takes place, *some cause* is shown to the Court *why final annulment or dissolution ought not to be permitted*. Intervention for this purpose may be made by an official known as the *Queen's Proctor*, or by any member of the public. Such interventions after decree *nisi* are rare, but may be made on the ground, for example, that there was a collusive arrangement (see above) which was not disclosed, or some other material fact, which was concealed from the Court at the hearing.

If such intervention succeeds, the decree *nisi* will be *rescinded* (*i.e.*, cancelled) and the parties will retain their former status. If there is *no such intervention*, or if such intervention is *dismissed*, then the marriage will be *finally annulled or dissolved* on application (on a special form), at the Divorce Registry concerned (not in open court), by or on behalf of the *Petitioner*, not earlier than *three months* after the decree *nisi* (unless the Court fixes a shorter time by special order). If the Petitioner does not make such an application, then the Respondent may do so after the lapse of a *further three months* (*i.e.*, six months after the date of the decree *nisi*), and the Court has power to grant or refuse such application or to deal with the case as it thinks fit.

The decree which *finally annuls or dissolves* the marriage is called a *decree absolute*. Unless and until it is granted, the marriage tie still subsists; the decree *nisi* does *not* terminate the status of husband and wife. But the *decree absolute* does terminate that status, leaving both parties free to marry again.

Incidental Matters

(1) Custody and Maintenance of Children.—Apart from the general power of the Chancery Division, as guardian of equity (D5), *to protect the person and the property of any infant* (D7) and of the Local Authority under the Children and Young Persons Act, 1963, (even though there may be no matrimonial proceedings between its parents), and apart from the additional powers of that Division and of Magistrates' Courts, under the Guardianship of Infants Act, 1925, *to appoint a guardian or guardians for any infant*, and to make orders for either parent to have *access* to the infant (*i.e.*, to see it periodically) and for the infant's *maintenance*, the Divorce Division itself may make orders for the *custody, maintenance, and education* of the *children of the family* (*see* D31(2)) in any matrimonial proceedings, and give directions for placing them under the protection of the Court, and for access to them by either or both of the parents. The expression "children of the family" includes children lawfully adopted by both husband and wife, children of a bigamous "marriage" which has given rise to nullity proceedings (D25), and also children born before the marriage of their parents and legitimated by that (subsequent) marriage. The Court may make such orders and give such directions at any time after proceedings have been commenced for nullity, divorce, judicial separation, or restitution of conjugal rights; it may make interim orders, and give interim directions, from time to time *during the proceedings*. It is, however, *unusual* for the Divorce Division to make orders for custody of or access to any child *over the age of sixteen* (since such orders would be difficult to enforce). (*See also* D31(1) for recent changes in the law.)

In all such proceedings, in *whatever court* they may be taken, the *paramount consideration* is the *welfare of the children—not the punishment of the "guilty" parent, nor any privilege* of the father as against the mother, or *vice versa*. (It is, for example, unusual for the Court to deprive the mother of the custody of a very young child, even though she has committed or is living in, adultery —unless, or course, she is neglecting the child or is a "bad mother" in the widest sense.) In some cases, for good reason, both parents may be passed over, and the custody of the child may be given to some third party.

(2) Financial Provision.—(a) *Alimony Pending Suit.*—On any petition for nullity, divorce, judicial separation, or restitution of conjugal rights, the Divorce Division may make such *order* for *payment by the husband to the wife* of *alimony pending suit* (*i.e.*, a periodical sum for or towards her support *during the proceedings*) as the Court thinks just. The Court may also *order a wife Petitioner*, in a suit for divorce or judicial separation on the ground of the *husband's insanity*, to pay *alimony pending suit* for or towards the *support of the husband during the proceedings.*

(b) *Permanent Alimony* is the term used for similar payments which the Court may order the husband to make to the wife *after* the pronouncement of a *decree of judicial separation* on any ground, and such an order *in favour of the wife* may be made even where a decree has been pronounced *against her*. An order for *permanent alimony* may also be made *in favour of the husband* in a case where the *wife petitioned* for judicial separation on the ground of *his insanity*. *Permanent alimony* may also be ordered in favour of the wife where an order for *restitution of conjugal rights* has been made in her favour.

(It will be observed that, in all the above cases, the period during which the payment of *alimony* may be ordered is *while the status of marriage remains in being.*)

(c) *Permanent Maintenance* is the provision which the Court may order the husband to make in favour of the wife *after a decree absolute of divorce or nullity—i.e.*, for the period *after the married status has been terminated*. (The Court may, *in exceptional cases*, make an order for *permanent maintenance* in favour of a "guilty" wife.) In *one case permanent maintenance* may be ordered *against a wife* and *in favour of a husband*—where the *wife petitioned* for divorce on the ground of *his insanity*. The order may be for payment of a *monthly or weekly sum* during the *joint lives of the parties* (*i.e.*, so long as they shall *both* live), or for a capital sum to be invested so as "to secure to the wife such lump or annual sum of money, for any term not exceeding her life," as the Court thinks reasonable, in both cases having regard to "*her fortune* (if any), to the *ability of the husband*, and to the *conduct of the parties*." The amount of the order is therefore left to the *discretion of the Court*; and it may be varied by the Court from time to time as the circumstances of the parties change. (The words "conduct of the parties" show that, in fixing the payments, the Court does not necessarily regard the question of "guilt" or "innocence" as clear-cut on the one side or the other; it may take into consideration the *whole history of the marriage*. The Court also takes into account the *property and income* of *both parties*.) (*See also* D32(1)). The Court may also order the husband to pay a reasonable lump sum to the wife.

(d) *Periodical Payments* may be ordered to be made, *by the husband to the wife*, on or after the making of a *decree for restitution of conjugal rights*, for the joint lives of the parties. The Court may order the husband to "secure" such payments as in the case of permanent maintenance. Where the *husband successfully applied* for the decree, the Court may order the wife, if she is "in receipt of any *profits of trade or earnings*," to pay to the husband, or for the benefit of the children, such part of those profits or earnings as it thinks reasonable. *See also* D32 (*D and E*).

Where a husband has been guilty of *wilful neglect to provide reasonable maintenance* for his wife or infant children, then, in any case where the wife might have petitioned for judicial separation, the Court may (on the wife's application) order the husband to make to her such *periodical payments* as may be just, and it may order the husband to "secure" such payments (as described above). (Thus, where there has been wilful neglect to maintain, on the part of the husband, the wife may apply for financial relief in the Divorce Division (or in a designated County Court) instead of in the Magistrates' Court; there is *no limit* in the Divorce Division or such County Court to £7 10*s*. a week, as there is in the Magistrates' Court (D24(2)). And the wife may make such an application even if she does not wish to petition for a decree of nullity, divorce, judicial separation, or restitution of conjugal rights.)

(e) In any case where the Court has power to make a *permanent* order, it may now order the payment of a *lump sum* (1965 Act).

(f) *Settlements.*—In any case in which the Court pronounces a decree for divorce or judicial separation by reason of the *wife's adultery, cruelty, or desertion*, the Court has power to order the wife's property, or any part of it, to be *settled* (D20) for the benefit of the innocent party, or of the children of the marriage, or both.

The Court also has power, after a decree for nullity or divorce, to vary the terms of any settlement which may have been made on the parties before or after their marriage; the variation may be made to benefit the children, or the parties or either of them, as the Court thinks fit.

(g) *Damages against Co-respondent.*—A husband who is petitioning for a decree of *divorce or judicial separation*, on the ground of his *wife's adultery*, may ask for an award of *damages against the Co-respondent* (*i.e.*, the man with whom she has committed adultery). Such a claim, which is comparatively rare nowadays, is usually tried before a judge and jury; the damages should be assessed so as to *compensate the husband*, so far as possible, for the loss of his wife where she has been seduced from his side by the adulterer.

(h) *Costs.*—The costs of the proceedings are *always in the discretion of the Court*, each case depending on its own facts. Generally speaking, however, the costs "follow the event"—*i.e.*, when a decree or order is made against a husband, he will usually be ordered to pay the costs incurred; costs, however, are rarely awarded against a "guilty" wife, but are not infrequently ordered to be paid by the Co-respondent (if any). An order for costs may be made, but rarely is, against the "woman named" in a petition as having committed adultery with the husband.

Note on Domicil.—It has been explained above (*see* D7) why the English Court will *not, generally speaking*, grant a *divorce* to a man who is *domiciled abroad*. Since the *domicil of a wife* is the same as *that of her husband* (even if she has not lived with him for many years), the refusal of the English court to accept jurisdiction has caused hardship in many cases. To mitigate this hardship the Matrimonial Causes Act, 1965, confers upon the Divorce Division an additional statutory jurisdiction in the following cases, *in favour of a wife*, even if her husband is *not domiciled in England*:

(*a*) In *any* matrimonial proceedings, *other than* for a "decree of presumption of death and dissolution of marriage" (see below), if: (i) the wife has been deserted by her husband, or the husband has been deported from the United Kingdom as an alien; and (ii) immediately *before the desertion or deportation* the husband *was* domiciled in England.

(*b*) In proceedings for *divorce* or *nullity*, if: (i) the wife is *resident* (*i.e.*, actually living for the time being) in England; and (ii) has been *ordinarily*

resident there for a period of *three years* immediately preceding the commencement of the proceedings; and (iii) the husband is *not* domiciled *in any other part of the United Kingdom*, or in the Channel Islands or the Isle of Man. (The two last-named territories have their own separate systems of law.)

(*c*) In proceedings for a decree of "presumption of death and dissolution of marriage": the husband is presumed by law (*for the purpose of ascertaining the wife's domicil*) to have died "immediately after the last occasion when she knew, or had reason to believe him, to be living." (Thus the wife can acquire an English domicil of her own as from that date.)

And, under the Matrimonial Causes (War Marriages) Act, 1944:

(*d*) In the special case of *marriages celebrated during the Second World War*, where: (i) the *husband* was, at the time of the marriage, domiciled *outside the United Kingdom*; (ii) the *wife* was, immediately before the marriage, *domiciled in England*; and (iii) the parties *never resided together* in the country which was the husband's domicil at the time of the marriage, the Divorce Division may deal with proceedings for divorce or nullity *as if both parties* were at all material times *domiciled in England*. (This provision was to cover the special cases of soldiers from the Dominions or Colonies, the United States or other foreign countries who, while stationed here during the War, married English girls and had to go back to their own countries, *leaving their wives behind*—in some instances without communicating with them again.)

RECENT CHANGES IN THE LAW

Important changes in the law have been effected by Acts of Parliament in 1958, 1965, and 1967:

A.1. In any agreement for maintenance made between spouses, without recourse to a Court, any restriction against applying to a Court for changes in financial arrangements is void, but the other provisions are valid and enforceable. "Financial arrangements" mean provisions governing rights and liabilities towards each of the spouses while living apart, including cases where the marriage may be dissolved or annulled, and rights and duties regarding the maintenance of a child of the family.

2. Where there has been a change of circumstances since the agreement was made, causing provisions to have been included or omitted, or where the agreement does not make proper provision for the children, the High Court or a Magistrates' Court may vary or revoke those clauses and insert others which appear to the Court to be just. (A Magistrates' Court, however, can only bring the maintenance up to £7. 10*s*. a week for a spouse and £2. 10*s*. for a child, and only if one party resides in the court's area).

3. Neither 1 nor 2 (above) precludes the right of either spouse to apply for an order containing "financial arrangements" under some other Act.

4. Where a maintenance agreement provides for continuing payments after the death of a party who dies after 16 August 1957, the surviving party may, within six months from probate or letters of administration (D18(2)) or, with the Court's leave, at any time before the estate is fully administered, apply to the High Court for an order under 2 above. The legal personal representatives (D18(2)) are not liable for distributing the estate after the expiration of the six months without taking these provisions into account; but the surviving spouse is not precluded from claiming from the beneficiary.

5. These provisions do not apply to any sum payable under a maintenance agreement made before 17 August 1957; and 1 (above) does not apply unless at least four-fifths of the estate is left after providing for funeral and legal expenses and debts, and no liability falls upon the legal personal representatives.

B.1. The powers of the Divorce Division to provide for the *custody, maintenance, and education of the children* of the family (D29(2)) are enlarged to apply also to a *child of one of the parties* (including an *illegitimate* or *adopted* child) "who has been accepted as one of the family by the other party," as they apply to a child (whether legitimate or illegitimate) of *both parties*. All such children are referred to as "children of the family", or "relevant children".

2. Where a husband has been *guilty of wilful neglect to provide reasonable maintenance* for his wife or infant children (D30(2), enabling the Divorce Division to order the husband to make *periodical payments* to the wife, the words "infant children" are to include any *illegitimate* or *adopted child* of *both* parties, and the Court may make orders for *custody of and access to* (D29(2)) any such children. If the Court considers it in the *child's best interests*, it may order the periodical payments for the child's benefit to be made *to the child* itself, or *to some other person* on the child's behalf, instead of to the wife (D30(2)).

3. The same Act contains further enlightened and much-needed reforms for the *protection of the relevant children* in matrimonial proceedings (whether defended or undefended). The Court, generally speaking, is *not* to pronounce a decree of *judicial separation* (D28(2)), or make *absolute* any decree for *divorce or nullity* (D29(2)), unless and until the Court is satisfied *either*—

(*a*) that arrangements have been made for the *care and upbringing* of every such child under 16, and that such arrangements are satisfactory or the best that can be devised in the circumstances, *or*

(*b*) that it is impracticable for the party or parties appearing before the Court to make any such arrangements

But the Court *may* proceed without observing these requirements if: (i) there are *special reasons* against delay, and (ii) either or both of the parties have given to the Court a *satisfactory undertaking* to bring the question of such arrangements for the children before the Court within a specified time. The Report of the Committee set up by the Archbishop of Canterbury (D27(1)) would refuse a decree *nisi* (D28(2)) until satisfactory arrangements for the children are made.

4. On any application to the Court for *special leave* to present a divorce petition *within three years from the date of marriage* (D27(1)), the Judge must consider, not only the *possibility of a reconciliation* between the parties and the *interests of the children of the marriage* (which was his duty under the Act of 1950), but also the interests of any child referred to in para. B.1 above.

5. Even if proceedings for divorce, nullity, or judicial separation are *dismissed*, the Court may still make provision for the custody, maintenance and education of any child referred to in para. B.1 above, and may vary such orders from time to time.

6. Finally, the Court is given power, in exceptional circumstances, to commit the care of any such child *either*: (i) to a *county council* or *county borough council*, *or* (ii) to an *independent person* under the *supervision* (if the Court think fit) of a *welfare officer* or of a county council or county borough council. Further powers are conferred on *Local Authorities* by the Children and Young Persons Act, 1963.

C.1. The words "continuously under care and treatment" (in relation to a spouse of unsound mind) (D27(1)) are to be interpreted *more liberally and more broadly* (in various ways) than has been the practice of the Court in the past.

2. A person who has *deserted* his or her spouse and is now of *unsound mind* may be regarded (for the purpose of divorce or judicial spearation) as *capable of forming the intention of continuing* the desertion, if the Court takes the view that the "deserting" party would in any event have stayed away (even if no unsoundness of mind had supervened). (*Note.* Hitherto the Petitioner has faced almost insuperable difficulties in such cases, since it is not normally possible to attribute to a person of unsound mind the capability of forming any "intention" whatsoever (D8(1)). *See also* Cruelty—D27(ii) (c), and D28 (c).

3. Where the Petitioner is seeking *divorce* on the ground of the Respondent's *desertion* without cause for at least *three years* preceding the presentation of the petition (D27(1)), any *agreement for separation* (whether in writing or not), entered into before *1st January 1938*, shall be *disregarded* by the Court if either: (*a*) the Respondent *had already deserted* the Petitioner, or (*b*) the Court is satisfied that the *circumstances* in which the agreement was made would have amounted to desertion (*without cause*) by the Respondent but for the Petitioner's apparent consent, in the agreement, to a separation.

(*Note.* Desertion did not become a ground for divorce until *1st January 1938*. Some deserted spouses may have entered into separation agreements, inadvertently, *before* that date, and this provision is intended to mitigate hardship where there was (at that time) a genuine case of desertion but the case was ruined by the signature of a written agreement to live apart, or by some form of spoken words or conduct, on the part of the deserted party, appearing to signify consent to the separation.)

D.1. Maintenance Orders *made by the High Court* (or a County Court) may be *registered in a Magistrate's Court*, which is given power to *vary* and to *enforce* such Orders. Maintenance Orders *made by a Magistrates' Court* may be *registered in the High Court*, which is given power to *enforce* such Orders. (The purpose of such registration is to make enforcement more easily effective; in some cases it may be more convenient for the wife to resort to High Court procedure; in others to proceed in the Magistrates' Courts.)

2. If the spouse (usually the husband) liable for payments under a Maintenance Order is a person *in employment*, and if his maintenance payments are at least four weeks *in arrear*, then the Court may make an *Attachment of Earnings Order*. This Order will *authorise and direct his employer to deduct from his earnings* certain sums (which the Court will specify), to be handed over *by the employer* to an official of the Court, who will pass them on to the wife as instalments towards the payment of: (*a*) the arrears, and (*b*) the amounts currently falling due under the original Maintenance Order. (*Note.* Hitherto the Courts have had no power to compel employers to collect such payments out of the defaulting husband's earnings; the wife's only remedy has been to ask for an order committing the defaulting husband to prison—a procedure which gave her *no financial redress* or assistance.)

The *Attachment of Earnings Order* will also specify the "protected earnings rate"—*i.e.*, the rate below which the Court thinks the defaulting husband's earnings should *not* be reduced by virtue of the authorised deductions. (*Note.* In other words, the Court will see that the defaulter is left with a reasonable part of his earnings to live on.)

E.1. The Court is given power to make an order against the Respondent (D27(1)) for financial provision (D30 (1)) in favour of the Petitioner (D27(1)) or the children, *either* at the time of the decree *nisi* (D29(1)) *or* at any subsequent date; but the Court is not to disregard any delay on the part of the Petitioner in applying for such financial provision.

2. The Court is given power to set aside (*i.e.*, cancel the effect of) any disposition of property by a Respondent husband (or former husband) in favour of some third party, if that disposition of property has been made within the past three years (preceding the Petitioner's application for financial provision), and seems to have been made with the intention of defeating or frustrating the Petitioner's application. But no such disposition of property is to be set aside if it was made *for valuable consideration* in favour of a *person who acted in good faith* and without knowing of the Respondent's intention to defeat or frustrate the Petitioner's application. (*Note.* This will enable the Court to protect a wife, in certain circumstances, if the Respondent husband (or former husband) has (for example) transferred part of his property to his mistress, with the intention of defeating his wife's claim to maintenance, alimony, *etc.* Up to now the Court has had no power to remedy such action by a husband who has made a transfer of the kind *prior to* a Court Order for maintenance, *etc.*) *See also* Lump Sum orders, D30 (e), and Matrimonial Causes Act 1965 (below).

3. The power of the Court to order "reasonable provision for maintenance" out of the estate of a deceased person (D16(2)), in a case where his will or intestacy does not leave his wife "reasonably" provided for, is now extended to benefit a *former wife* (*i.e.*, "a woman whose marriage with him was during his lifetime dissolved or annulled.") (*Note.* This definition is not limited to a former wife who was the "innocent" party in divorce proceedings; but the Court has a discretion to make or refuse the order, taking all the circumstances into account.) Such an order may be discharged, varied, suspended or revised at the suit of various interested parties.

4. The Court's powers under paras. 2 and 3 (above) are extended to protect: (*a*) a *former husband* whose former wife has divorced him, or obtained a judicial separation against him, on the ground of *his insanity* (D27(1)), or (*b*) where the Court *has* ordered a settlement of the wife's property, or "periodical payments" out of her income, where there has been a decree for restitution of conjugal rights (D28(1)).

5. The executors or administrators (D18 (2)) of the deceased spouse are not to be liable if, when a claim under para. 3 is made, they have already distributed the deceased's estate (provided they waited for 6 month after the Grant of Probate or Letters of Administration (D18 2)); but the claimant under para. 3 can follow the property into the hands of a beneficiary and recover it (if it is still available) by means of an order under para. 3 (above).

6. Under the Married Women's Property Act, 1882, the Court was given power to decide in a *summary manner* (*i.e.*, by a rapid and simple procedure) disputes between any husband and wife about the *ownership of any property*. That power is now extended to cases where the respondent spouse *has been, but no longer* is, in control of the property, or the *claimant does not know* whether it is still in the respondent's control or not. The Court may order the necessary enquiries to be made; in appropriate cases it may also order property in the hands of the respondent, or of a third party, *to be sold*, so that the claimant may have his or her share paid out of the proceeds.

F. The Court is given power to grant an injunction against any person who appears likely to dispose of property so as to defeat any of the provisions of E (above) or to transfer such property abroad.

G. If any question arises as to the right of a husband or wife to money derived from any allowance made by the husband for housekeeping, or any similar expenses, or to any property acquired out of such money, the money or property (in the absence of agreement to the contrary) shall be treated as belonging to them both in equal shares. (The old rule was that the wife's savings out of housekeeping allowances belonged to the husband.)

H.1. Following certain Court decisions, on equitable grounds (D4–5), the Matrimonial Homes Act, 1967, *protects* the rights of either spouse to *remain in occupation* of the matrimonial home, *even if it belongs to the other spouse.* If already in occupation, he or she is *not to be evicted* except with leave of the Court; if not in occupation, he or she *may enter and occupy the home.* The Court has power to enforce, restrict or terminate these rights, *having regard to the conduct of both* spouses, *their needs and financial resources*, those of the *children*, and all the *circumstances*. The Court's powers include the right to *except part of the home* from a spouse's occupation, to order one spouse in occupation to make *periodical* payments in respect of such occupation, and to *impose on either* obligations for *repairing, maintaining* or *discharging liabilities* on the home. Any payment made by the occupying spouse towards satisfaction of the other *spouse's* liabilities for *rent, rates, mortgage payments, etc.*, shall count as if it were made by the other spouse. Occupation of the home by one spouse shall be *treated as possession by the other spouse* if he or she is *protected by the Rent Control* provisions (D34(1)); but this shall not affect any right of the occupying spouse against the other under any Act or Order. These rights are to *last only so long* as the marriage subsists, unless provision is made ((2) below) for such rights to be a *charge* on the other spouse's ownership or lease.

2. If one spouse is *entitled in law* to *occupy* the house as *owner* or *lessee*, the *other spouse's rights* of occupation shall be a *charge* on the first spouse's *title* (D22(2)), from the date of acquisition of the right, the marriage, and the coming into force of the Act. The right shall be *terminated* (a) *by death of the second spouse*, or (b) *by the termination of the marriage* (*unless* the Court *otherwise orders*). Any *surrender* of ownership or tenancy shall be *subject to these rights*; so also shall *bankruptcy* of the owner or lessee. The rights on *any one home* may be *registered* at the Land Registry for the second spouse's protection; only a *mortgagee* (D22) *can enforce his rights* against both spouses.

3. If the owner or lessee *contracts to sell or let* his *legal estate* (D22(2)) in the home, such *registered charge must be cancelled before* vacant possession can be promised. The Chief Land Registrar shall cancel the charge if either spouse is dead, or on a divorce or nullity decree (D25(2); D29(2)), or under a Court Order. A spouse entitled to such protection may release his or her rights in writing.

4. If the Rent Control Acts (D34(1)) apply, and there is a *decree absolute* (D29(2)) of *divorce or nullity*, the *Court may direct* that the ownership or lease be *transferred to the former spouse* if he or she was not already owner or lessee, and the originally protected spouse shall no longer be protected. Or the *Court may direct that both spouses*, together or separately, shall be *liable for any obligations* in respect of the home; but the *landlord* must have an opportunity of being *heard by the Court*. (This paragraph does not affect the rights in paragraph (1) above.)

(*Note:* Broadly, these provisions *prevent* a husband or wife who is owner or lessee of the matrimonial home from turning out the other spouse after the marriage has broken up).

STATUTORY REFORMS IN LAW OF LANDLORD AND TENANT

(1) Business Tenancies

Under the Landlord and Tenant Act, 1954, Part II (and cases decided under it) *security of tenure* is granted (under certain conditions) to a lessee or under-lessee who *occupies premises for the purpose of a trade, business, profession or employment* carried on by him on the premises. (We shall refer to such premises as "*the holding*".) The holding may not be used as business premises, and there is no security, if the lease or tenancy agreement prohibits their use as such, unless permission has been given by the lessee's (or underlessee's) landlord to that effect. *Tenancies excluded* from protection include agricultural holdings, mining leases, on-licensed premises (except certain hotels and restaurants) and tenancies not exceeding three months, unless the tenant and the person who carried on the same business there before him have occupied the premises for more than six months altogether.

A holding is protected by the Act by the provision that the *tenancy does not automatically come to an end* on the date specified in the original lease, but only (i) *if the landlord gives to the tenant not less than six nor more than twelve months notice* in writing to terminate the tenancy; (ii) *if the tenant gives to the landlord, within a similar period, a request for a new tenancy*; (iii) where the tenancy is for a *fixed period*, if the *tenant gives at least three months notice* (expiring at the end of the period or on any quarter day afterwards) *that he does not want the tenancy continued*; (iv) if it is a *periodic tenancy* (from month to month or year to year), the *tenant gives the landlord notice to quit*, of the full legal length; (v) if the tenancy is *surrendered* or (vi) if the tenancy is *forfeited* (which can be done by the landlord only on a Court application). In cases (*i*) *and* (*ii*), the *parties may agree* to fresh terms for a new tenancy. It is *vital* in such cases that the *time-table* laid down in the Act shall be adhered to, and the *advice of a solicitor* should be sought *at least twelve months before the end of the lease*; if any request or application is out of time, the Court cannot help the party in question. The twelve months or six months *notice of termination* (see above) *must not expire* earlier than the date of expiry of the original lease.

Where (i) the landlord serves the notice of termination: (*a*) it must require the *tenant, within two months of the notice* being given, *to notify the landlord whether or not he is willing to give up possession* on the specified date; (*b*) it must state *whether or not the landlord will oppose an application to the Court* for a new tenancy, and if so on what grounds. Four of the grounds are that the tenant has neglected repairs or payment of rent for which he is liable or committed some other breach of his lease, or that the landlord has offered reasonable alternative accommodation. Three further grounds are: (*e*) that the existing tenancy is an underlease of part of premises held under the head lease, and the separate lettings would produce a lower total rent than if the whole were let together; (*f*) that on the termination of the current tenancy the *landlord intends to demolish or reconstruct* the holding or a substantial part, and could not reasonably do so without obtaining possession of the whole; (*g*) finally, that on the termination of the current tenancy, *the landlord intends to occupy the holding* for the purposes of a business to be carried on by him, or as his residence. (But the landlord *may not oppose* the grant of a *new lease on this final ground* if his interest was purchased or created within *five years* immediately preceding the termination of the lease.)

If the *tenant* prefers *to request a new tenancy*, he must propose to the landlord that it shall commence not more than twelve nor less than six months from the date of request; but the commencement must *not be earlier than the date of expiry* of his existing lease. The tenant must also propose the period of the new lease, the rent he is willing to pay and the other particulars of the proposed new tenancy. The tenant cannot make such request (*a*) if the landlord has already served a termination notice, or (*b*) if the tenant has served notice to quit; nor can either (*a*) or (*b*) take place after the tenant's request for a new tenancy.

Within two months after the tenant's request, the landlord must serve on the tenant notice stating on which of the above grounds (if any) he will oppose the Court's grant of a new tenancy. The parties cannot make any agreement to the effect that the Act shall not apply.

The next step is for the *tenant, not less than two months nor more than four months after the landlord's termination notice or the tenant's request* for a new tenancy, *to apply to the County Court*, which *must grant him a new tenancy* on such terms as the parties may agree on or the Court thinks fit, unless

the landlord establishes any of the above grounds of objection. If the *landlord's objections are false*, the Court will grant the tenant *damages*.

If the landlord establishes any of grounds (e), (f) or (g), so that the Court cannot grant a new tenancy, the Court orders the *landlord to pay to the tenant compensation for disturbance*. If the tenant has carried on *business* on the holding *for the whole of fourteen years* preceding the termination, the compensation is *twice the net rateable value;* if for a *lesser period, a sum equal to the rateable value.*

If the above procedure is carried out, the *old lease continues* in effect *until the final disposal of the case*, even if the lease has expired meanwhile. "*Final disposal*" includes any necessary *time for appeal.*

(2) Residential Tenancies

Under the Rent Act, 1965, *security of tenure* is provided for *tenants of dwellings* with *rateable value* (*a*) *up to* £400 a year in the *Metropolitan Police District* and £200 *elsewhere* (including (*b*) those still controlled by the old Rent Restriction Acts 1920 to 1939, which now apply only to very small and low-rated dwellings.) The Act imposes a *standstill on present rents* (except variations of rents including rates, cost of services and owner's improvements). *Rent officers or assessment committees* will be set up *to revise rents* in category (*a*). The protected tenancies under (*a*) are called "regulated tenancies". Certain *statutory tenancies* of *formerly requisitioned dwellings* (which would have *expired on March 31, 1966*) are continued after that date as regulated tenancies. *Occupiers who are not tenants* (*i.e.* those in occupation *necessarily because of their employment*, such as caretakers) *are included* under the term "tenants". A tenancy of which a non-profit-making Housing Association is landlord is exempt from regulation).

The task of the *rent officers and rent assessment committees* is *to fix fair rents* on application of landlord or tenant, or both, in counties, county boroughs, London boroughs and the City of London. They are *to take into account all the* circumstances, age, character, locality and state of repair of the dwelling; but *disrepair due to the tenant's neglect* and *improvements by the tenant* are to be *disregarded*, as is *also* any *great demand* (*exceeding supply*) *of dwellings in the district*. The fixed rents are to be registered, and must *include payments for furniture and services* (*if any*). *If the landlord pays rates*, that fact is to be noted, and the *registered rent plus the rates may be recovered from the tenant.* If the cost of services, or of repairs to be done by the landlord, is a variable sum, the registered terms must say so. The landlord cannot lawfully recover more than the registered rent, taking the above variations into account.

It is *unlawful for any person* (with intent to *cause the residential occupier* to *give up occupation* or to refrain from pursuing his rights or remedies) to do anything calculated *to interfere with his peace or comfort* or *persistently to withdraw or withhold services* reasonably required for occupation. "Residential occupier" means a person occupying the premises as a residence, either by contract or by any Act of Parliament. The penalty is a fine up to £100 or imprisonment up to six months or both, before the magistrates, for a first offence, and a fine up to £500 or the imprisonment, or both, for a subsequent conviction. The *occupier*, even if the premises are not "protected" (*i.e.*, not subject to the Rent Restrictions Acts or certain other statutes) *cannot lawfully be evicted even* when the tenancy has terminated and the occupier continues to reside there, *without leave of the Court. In default*, the owner is liable, on conviction before the magistrates, to a *fine up to* £100 *or six months' imprisonment or both*—unless he can prove that he reasonably believed that the occupier had ceased to reside in the premises. *Occupiers protected* are the tenant or *former tenant*, a lawful *subtenant*, and the widow or widower, or any member of the family of either, residing with the occupier at his death.

The demand for or taking of a premium as a condition of the grant, renewal, continuance or transfer of a *protected tenancy* (in addition to the rent) *is forbidden* (except in case of expenses, paid by the outgoing tenant, for a period after the transfer, or improvements he has paid for, or as a refund to the outgoing tenant of any reasonable premium which he himself paid on taking possession, or (if part of the premises are business premises) for goodwill transferred to the incoming tenant.) There are also *restrictions on the demand for, or taking of, a premium in relation to a "regulated tenancy"*; broadly speaking, a premium is lawful only if the tenancy or its continuance is for more *than seven years*—and then only if the registered rent is higher than the rent payable under the tenancy.

There are wide provisions regarding the protection of occupiers of furnished dwellings and regarding mortgages. As the Act of 1965 has only recently come into force, there is little case law on the subject, and legal advice should be sought.

(*Note:* Parliament has recently seen the introduction of legislation to reform the leasehold system for residential property (D21)).

ADOPTION OF CHILDREN

Adoption is the act of a person who takes upon himself the position of parent to a child who is not in law his own legitimate child. It has been for centuries very common in India and most Continental countries, and for over a hundred years in most parts of the United States. It was recognised by the laws of Greece and Rome from early times. Julius Caesar adopted his grand-nephew Octavian (afterwards the Emperor Augustus) in 46 B.C. But there was no provision for adoption under the Common Law of England (D4); the transfer of parental rights and duties in respect of a child to another person was unknown to our law until 1926, when the first of a series of Adoption Acts was passed. There have been a number of amendments since then. The present law is mainly contained in the Adoption Act, 1958. "Informal adoption," outside the Act, is invalid. (But the Law Commission (D5(2)) is studying the possibility of recognising foreign adoptions.)

The procedure for adoption is as follows:

(1) Approach by would-be adopters to a registered Adoption Society or Local Authority for help in adopting a child, and explanations of their qualifications.

(2) Investigations of suitability of persons and home, including medical matters, and notification to parent(s) of eventual need for formal consent and effects of Order when made.

(3) Informal consent of parents or guardian to handing over of child to would-be adopters "on trial."

(4) Actual handing over of child to would-be adopters "on trial."

(5) Formal application by would-be adopters to a Court.

(6) Formal consent of parents to adoption.

(7) Hearing by the Court. If an Order is refused, and there is no appeal, the child must be returned to its parent(s), or to the Local Authority if the parents are unsuitable. There may be an appeal, while the child is still in the hands of the Applicants, to the Court of Appeal and the House of Lords. If the original application, or appeal, succeeds, an Order is made. *Then, and only then is the child adopted.*

We shall now explain the sequence in more detail.

Applications for Adoption.—The would-be adopters (the "Applicants") normally approach

a registered Adoption Society, a County Council or County Borough Council to make and participate in adoption arrangements, which must eventually be confirmed by an Order of the High Court, a County Court, or a Magistrates' Court hearing juvenile cases. The Adoption Society or Local Authority carefully investigates the suitability of the Applicants, interviews them and sees their home, and ascertains the religion in which the parents wish the child to be brought up. The Applicants must produce a certificate from a registered medical practitioner to the effect that they are in good health, as must the parents of the child to certify that its health is good. The Society or Local Authority must hand the parents a memorandum, in ordinary language, explaining the effects of an Adoption Order if made by the Court, and calling attention to the parents' formal consent being eventually required. Such consent may be withdrawn at any time before the Order is actually made, but may be dispensed with by the Court on special grounds (see below, para 8).

If all these preliminary matters are satisfactory the Society or Council may hand the child over provisionally to the Applicants for a "trial period" of not less than three consecutive months preceding the Order, if made; but no period is counted before the child is six weeks old. No maximum period is laid down by law within which the Applicants must apply to the Court. This is regarded by reformers as a serious defect in procedure. In a recent case (December 1965) nearly two years had elapsed between the handing over of the child "on trial" to the would-be adopters in their home, and the Court Hearing. The parents of the child were F, a married man, and his mistress M, a single woman, both Roman Catholics. Without the knowledge of F, M arranged to hand over the child to the would-be adopters (X and Y, also Roman Catholics but "strangers" of good repute), whose home was eminently suitable and who would have made excellent adopters. (A "stranger" is anyone who is not a "parent" or "relative".) The child remained in their care and possession from the age of six weeks to two years. Meanwhile F had left M and had become reconciled with his wife. He complained, shortly before the Court heard the case, that his formal consent had not been obtained, and claimed the right for himself to have access to and custody of the child under the Legitimacy Act 1959; his wife supported his application. The result of the delay was that the High Court Judge, having seen and heard all parties, decided reluctantly that there was little to choose between F and his wife, on the one hand, and the Applicants X and Y; but felt that the "blood-tie" between father and child justified refusing an Order to the "strangers," and ordered the child to be handed over to F and his wife (who in due course applied for an Adoption Order). X and Y appealed to the Court of Appeal, but two out of three Judges upheld the original Judge's decision, and a further appeal to the House of Lords failed. Thus the child, two years old, was taken away from the only "parents" it had ever known and handed over to F and his wife whom the child did not know at all. This is an unusual case, but a very sad one, and reformers consider that there should be a maximum period of (say) six months, within which the Applicants must apply to the Court for an Order, and the parents should be compelled to decide within that period whether or not they are prepared to give formal written consent to the proposed adoption. (The Chancery Division of the High Court has recently issued directions to speed up administrative work on adoptions.)

Such formal consent may be dispensed with by the Court if a parent, or his or her wife or husband, cannot be found, is incapable of consenting, or is living apart in what seems likely to be a permanent separation. A parent's consent may also be dispensed with if he or she has abandoned, neglected, or ill-treated the child, or is "unreasonably" refusing consent. If the parent does not attend the Court hearing, that consent must be given in writing, witnessed by a J.P., County Court officer, or Magistrate's Clerk; or outside England by a British Consul or Vice-Consul or foreign Notary.

As soon as an application to the Court is filed by the Applicants, the Official Solicitor (or, in Magistrates' Court cases, the Clerk to the Local Authority) is appointed the child's guardian *ad litem* (*i.e.*, guardian for the purpose of the proceedings, who looks after the interests of the child without regard to those of anybody else). If no appointment for the Court hearing is made within 15 days from the application to the Court, the guardian *ad litem* must apply for the Court's directions. (This is a new rule, to avoid some such delay as arose in the case described). The Court then hears the case *in camera* (*i.e.*, in private, the public not being admitted) and has a complete discretion either to make or to refuse an Adoption Order. If refused, and there is no appeal, the child must be returned to its parent(s) or, if they are unsuitable, placed in the care of the Local Authority. If an Order is made or the Applicant(s) successfully appeal, the child remains with the Applicant(s): only on the making of an *Adoption Order* by the Court is the child legally adopted.

Adoption Orders.—The High Court, a County Court, or a Magistrates' Juvenile Court may make an Adoption Order authorising an Applicant, in the prescribed manner, to adopt a child. An Order may be made on the application of two spouses jointly, or by one spouse with the consent of the other spouse; but in no other case may an Order be made in favour of more than one person. (Dispensing with consent—*see Applications for Adoption*, para 8). An Order may be made authorising the adoption of an illegitimate or legitimated child, or the re-adoption of an already adopted child (*e.g.*, in case of the death of the Adopter(s)), by his or her mother or natural father, either alone or jointly with his or her spouse: this facilitates the adoption of illegitimate or legitimated children and puts them (for record purposes) on a par with legitimate children who have been adopted. (A legitimated child is one born out of wedlock, but whose parents have subsequently married).

An Adoption Order may not generally be made in England unless the Applicant and the child are living in England. Nor may an Order be made unless the Applicant (or one of two Applicants) is: (*a*) the mother or father of the illegitimate or legitimated child (with the other parent's consent); or (*b*) a "relative," *i.e.*, a grandparent, brother, sister, uncle, or aunt of the child, or a person who would be such relative if the child were the legitimate child of its mother or father, or of former adopters, and such relative is aged 21 or over; or (*c*) in any other case, is 25 years old or more. On the application of a sole male Applicant to adopt a female child, no Order may be made unless the Court is satisfied that there are "special circumstances" justifying an Adoption Order "as an exceptional measure."

No Adoption Order may be made unless the child has been continuously in the care and possession of the Applicant for at least three consecutive months immediately preceding the Order (not counting any time before the infant is six weeks old): this is subject to the safeguards detailed below as to supervision of a "protected child." (But in the case of Applicants domiciled (D7) outside Great Britain, who desire to adopt an infant under the law of the country of domicil, and to obtain a provisional Adoption Order in England, the child may be taken or sent abroad for the purpose first mentioned and the period of three consecutive months is extended to six). Except where one of the Applicants is a parent of the child, no Order is to be made in respect of that child who, at the hearing, is below the upper limit of the compulsory school age, unless the Applicant has given notice, in writing, to the Local Authority of his intention, at least three months (in cases of provisional adoption, six months) before the Court Hearing.

Formal Consents Required.—No Order may be ordinarily made without the consent of every person who is a parent or guardian of the child (which may be given either unconditionally or subject to conditions as to the religion in which

the parent or guardian requires the child to be brought up). Even so, the consent of the parent or guardian may be dispensed with (*see Applications*, para 3). Where a parent or guardian has given informal consent without knowing the identity of the Applicant(s), and subsequently withdraws his or her consent solely on this ground, he or she is deemed to be witholding consent "unreasonably."

Matters on which the Court must be satisfied.—Before making the Order the Court must be satisfied:

(*a*) that every person whose consent is necessary, and has not been dispensed with, has consented to and understands the nature and effect of the proposed Adoption Order; in particular that every parent understands that the effect will be to deprive him or her permanently of his or her parental rights;

(*b*) that the proposed Order will be for the child's welfare;

(*c*) that the Applicant has not received or agreed to receive, and that no person has made or given, or agreed to make or give, any payment or other reward, in consideration of the adoption, except such as the Court may sanction (if any).

As to (*a*), the Court must have regard to the Applicant's health, to be evidenced by the certificate of a fully registered medical practitioner; the Court shall also give due consideration to the wishes of the child, having regard to his or her age and understanding. The Court may impose such terms and conditions as it thinks fit, including a requirement that the adopter shall make such financial provision for the child as is just and expedient. It may postpone a decision on the application and make an interim order giving the Applicant *custody* of the child for a probationary period not exceeding two years, upon such terms as it may think fit, for the maintenance, education, and supervision of the child's welfare. The same rules apply to an interim order for custody, as to consent and dispensing with consent, as for a final Adoption Order; but the Court may not make an interim order without the three months' care and possession and notice to the Local Authority as are provided above. An interim custody order for less than two years may be extended to the full two years, but no longer. An interim order for custody is not an Adoption Order.

Procedure and Appeals.—To safeguard the child's interests during the hearing the Court has to appoint a guardian *ad litem* (*see Applications for Adoption*, para 3).

Effects of Adoption Orders.—Upon an Order being made, all rights, duties, obligations, and liabilities of the parents or guardians in relation to custody, maintenance, and education of the child, including rights to appoint a guardian by will, to consent or refuse consent to its marriage, shall be extinguished; and all such rights, etc., shall be exercisable by, and enforceable against, the Adopter(s) as if the child were his, her, or their legitimate child, and the child shall stand to the Adopter(s) in the same position. If two spouses are the Adopters, they shall stand to each other and to the child (for the purpose of court orders for custody, maintenance of and right of access (**D20**)) as if they were the lawful father and mother, and the child shall stand to them in the same relation.

For the purpose of the marriage laws, an Adopter and Adoptee shall be regarded as if they were within the prohibited degrees of blood relationship—even if a later Adoption Order is made in favour of another person (*i.e.*, an Adopter may not in any circumstances marry the Adoptee).

Succession to Property.—If, after an Adoption Order, the Adopter or Adoptee dies without a will in respect of any property, the property shall devolve as if the Adoptee were the lawful child of the Adopter (**D18–20**) and not the child of any other person. In any disposition of property made by will, codicil or settlement (**D16, 20**) after an Adoption Order, a reference to the "child or children" of the Adopter shall include a reference to the Adoptee (unless the contrary intention appears). The will or codicil is treated as having been made at the Adopter's death. But any reference to the "child or children" of the natural parents (or either of them) shall not include a reference to the Adoptee. And any reference to a "relative" of the Adoptee shall (unless the contrary intention appears) be regarded as a reference to the person who would be such a relative if the Adopter were his lawful parent. (But these provisions do not apply to any dignity or title of honour—*e.g.*, a hereditary peerage).

For the purposes of the Administration of Estates Act, 1925 (**D18–19**), an Adoptee shall be regarded as a brother or sister of any child or adopted child of the Adopter. Executors and administrators (**D18–19**) are not liable if they distribute the estate of the Adopter without ascertaining that no Adoption Order has been made; but the Adoptee may sue the beneficiary for the Adoptee's share of the property; but if there has been more than one Adoption Order, the earlier adoption shall be disregarded.

Citizenship.—If the Adoptee was not a citizen of the United Kingdom and Colonies (**D7**) but the Adopter or male Adopter is, the Adoptee shall be such a citizen as from the date of the Adoption Order.

Registration.—The Registrar-General is to keep an Adopted Children's Register, to contain authorised entries but no others. A certified copy of the entries counts as evidence; the index may be searched by anybody, who may obtain a certified copy of any entry. No other record may be seen by the public without a Court Order. Every entry shows only its number, date, and country of birth of the child, the name and adopted surname of the child and of the Adopters, the date of the Adoption Order and of the Court, the date of entry, and signature of the Registrar. The word "adopted" or "re-adopted" is written against the name of the child in the Register of Births; but this shall be cancelled if an Adoption Order is refused or an appeal against adoption succeeds.

If a child adopted by its mother or natural father is subsequently legitimated by their marriage, the Court of Adoption may, on their application, revoke the Adoption Order and the entries in the register and any certificate shall be cancelled.

Local Authorities and Adoption Societies.—Except for the Local Authorities or registered Adoption Societies mentioned at the commencement of *Applications for Adoption*, para 1, no other body may make adoption arrangements; and even the authorised bodies may not place the child in the care and possession of a would-be adopter if the last-named person could not lawfully adopt him, under the penalty of a fine of £100 or six months' imprisonment; and the Court may order the child to be returned to his parent(s) or guardian(s) or to the Local Authority or registered Adoption Society. There are strict provisions as to which Adoption Societies may be registered or struck off the register, and as to appeals.

Care and Possession of Infants awaiting Adoption.—While an application is pending, a parent or guardian who has assented may not, without the court's leave, remove the infant from the care and possession of the Applicant; the Court will not give leave without considering the infant's welfare. The parent(s) or guardian(s) may not take back an infant, in the care and possession of any Applicant, before the actual Adoption Order, and must give written notice to the Authority or Society (before an Adoption Order is made) of the

parent's or guardian's intention to part with the child, in which case the child must be handed to the Applicant(s) through the Authority or the Society. Only in cases where the adoption application is refused by the Court or on appeal, may the child be returned to or retained by the parent or guardian.

Supervision.—Where arrangements have been made for placing a child, below the upper limit of compulsory school age, in the care and possession of a "stranger," or where notice of intention to apply for an Adoption Order is given, then the child is known as a "protected child" while it is in the care and possession of a "stranger"; but not if it is in an Approved School or some other home under the Children's Acts. The child ceases to be a "protected child" at the age of 18, or on the making of an Adoption Order. It is the duty of every Local Authority to see that every "protected child" is periodically visited by its officers, who shall satisfy themselves of the child's well-being and give such advice as may be needed. The officers must produce a document of authority, and may then inspect any premises where the child is kept or to be kept. It is the duty of any "stranger" to give notice of all arrangements with regard to "protected children," including any change of address, and particulars of the name, sex, date and place of birth, and name and address of the parent(s) or guardian(s) or person(s) from whom the child is received. In the event of a "protected child's" death, the person(s) having care and possession must give written notice to the Authority. If neither the Local Authority nor a registered Adoption Society took part in the arrangements, and it appears to the Authority that such arrangements would be detrimental to the child, the Authority may in writing prohibit the proposed Adopters from keeping the child in any premises, subject to appeal to a Juvenile Court. If the Court is satisfied that a "protected child" is received or about to be received by an unfit person, or in non-approved premises, the Court may order his removal to a place of safety until he can be restored to his parent(s) or guardian(s) or relative(s). On proof that there is imminent danger to the child's health or well-being, this power may be exercised by a J.P. A Local Authority may receive any child so removed (even if not a "protected child" and even if he is over 17) informing the parent(s) or guardian(s) of what has been done. There are heavy penalties for any contravention by a "stranger" of these provisions.

A warrant may be issued, in the event of refusal to allow a visit, or the inspection of premises by an authorised person.

General.—It is generally unlawful to give any payment in consideration of the adoption of a child, any grant of consent (*i.e.*, formal or informal) in connection therewith, the transfer of care and possession, the making of arrangements for adoption—penalty, fine £100 and/or six months' imprisonment; but this does not apply to payment of a registered Adoption Society's expenses, or any payment authorised by a Court. No advertisement may be published indicating the desire of the parent(s) or guardian(s) to have his, her, or their child adopted, that a person desires to adopt a child, or that any person (except a Local Authority or registered Adoption Society) can make such arrangements—penalty, fine £50.

Detailed Court Rules have been made for the carrying out of these arrangements.

There are five Schedules to the 1958 Act. Schedule III, the most important, sets out the nature and purposes of the Regulations which every Adoption Society must have.

> Every Adoption Society must set up a "case committee" of not less than three, to consider each individual case.
>
> No child shall be delivered to the proposed Adopter until the latter has been interviewed by the case committee, who must inspect the premises where the child is to live permanently after all the reports have been considered.
>
> Every Society must furnish a report on its activities and the prescribed accounts.
>
> Provision must be made for the care and supervision of any child placed with a Society with a view to adoption.
>
> There is a prohibition of or restriction upon disclosure of records kept by the Society, and provision for their safe keeping.

Note: The Law Commission has recommended a new branch of law called "Family Law" to include *all* matters relating to infants (including adoption, legitimation, care, custody, and control, as well as matters of marriage, divorce, and separation), to be supervised by one Division of the High Court, instead of sharing them (as at present) between the Chancery and Divorce Divisions.

JUSTICES OF THE PEACE

Sentencing Policy.—The arrangements, announced at the end of May 1964, by the Lord Chief Justice, "for the purpose of achieving greater uniformity of sentencing policy and a deeper understanding of the many social factors involved," comprise the organisation of more and longer conferences of all holders of judicial office, including justices of the peace, chairmen of quarter sessions, recorders and High Court judges. Working parties, in groups, are to consider case histories of "offenders," and later meet to discuss the sentences which each group would have passed if these cases had come before them in court. On the same day it was announced from Downing Street that a Royal Commission was being appointed (under the chairmanship of Lord Amory (former Chancellor of the Exchequer)),

> "to conduct a fundamental review of penal methods, the concepts and purposes which should underlie the punishment and treatment of offenders in England and Wales; to report how far they are realized by the penalties and methods of treatment available, and whether any changes are desirable in these, or in the arrangements and responsibility for selecting the sentences to be imposed on particular offenders; and to review the work of the services and institutions dealing with offenders and the responsibility for their administration, and to make recommendations."

Some of the Commission's recommendations are incorporated in the Criminal Justice Act, 1967 (D41).

Compulsory Training of New J.P.s.—Early in June 1964 the Lord Chancellor announced new arrangements for the *compulsory* training and instruction of newly-appointed justices of the peace, and fresh attempts to stop "glaring instances of inadequate, excessive or inconsistent sentences." An advisory council has re-organised the present scheme for *voluntary* training (which started in 1950), and every newly-appointed justice is to give an undertaking not to try cases, without the Lord Chancellor's authority, until he or she has been through a *compulsory* course. The course includes attending as observers in their own and other courts and at quarter sessions, and visits to prisons, borstals, and similar institutions.

General Duties of J.P.s—All these announcements have focused attention upon the work of justices of the peace—the unpaid, lay magistrates throughout the country who deal with the largest proportion of criminal offences, in various courts. Other manifold duties fall upon them—the appointment of special constables, certain matters relating to highways, the grant and renewal of licences for the sale of intoxicating liquors,

"domestic proceedings" (matrimonial orders between husband and wife), custody of children and affiliation and adoption orders. Certain magistrates—both laymen and lawyers—with special qualifications sit in juvenile courts to deal with offences by and against young people, and with the committing of young people to the care of approved persons or authorities, whenever the young people are in need of care and protection.

Although, therefore, the criminal jurisdiction of J.P.s (as they are generally known) is by no means the full extent of their duties, it is this criminal jurisdiction which has been most frequently in the public eye; and the three announcements mentioned above relate only to that aspect of the J.P.s' duties. Neither historically nor currently are J.P.s expected to be lawyers; the clerk of the court, who advises them on points of law, is always a solicitor; and at quarter sessions the chairman and deputy chairman are usually barristers or solicitors of not less than ten years' standing, with special qualifications for the task.

Procedure and Powers.—For "domestic proceedings" and in juvenile courts (outside the City of London and the metropolitan stipendiary court area, where full-time, legally-qualified, paid magistrates preside), not more than three J.P.s should sit, including both a man and a woman, whenever practicable. For other duties not more than seven J.P.s (and, preferably, not more than five, and an odd, not even, number) should sit. The election of a chairman and a number of deputy-chairmen is held by the J.P.s in October; those elected hold office for one year from January 1, and are eligible for re-election. All sittings are held in public, except in "domestic proceedings," custody and adoption cases; and in these and in juvenile courts the press, though not usually excluded, are not permitted to identify the parties by name or address, or to publish evidence of an indecent character (D25(1)).

The powers of one single J.P., sitting alone, are restricted to adjourning a trial, remanding a prisoner in custody or on bail, and taking recognisances. An information charging an offence may be laid before him; if it is in writing, and substantiated on oath, he may issue a warrant; in a civil matter, in similar circumstances, he may issue a summons. Search warrants may, in most cases, be issued by a single J.P., and so may a summons or warrant requiring the attendance of a witness. A stipendiary (legally-qualified, paid, full-time magistrate) is not so limited; he has all the powers of a court of summary jurisdiction (*i.e.* two or more J.P.s sitting together).

Criminal Jurisdiction.—Except in those instances in which a special limit of time is prescribed by a particular Act of Parliament, no information may be laid (in regard to a criminal offence), nor complaint (in a civil case) after the lapse of six months from the date when the offence was committed or the matter of complaint arose. The J.P.s' criminal jurisdiction covers (1) the trial of "summary offences" (minor offences triable by a magistrates' court other than under (2) below) punishable by a maximum of six months imprisonment for one offence, or a fine (in general) not exceeding £100. The jurisdiction also extends to (2) certain "indictable" (more grave) offences which may be tried summarily if the accused consents; in such cases the maximum punishments are 6 months imprisonment or a fine not exceeding £400, or both, for one such offence, or 12 months imprisonment for two or more such offences. There are also (3) certain petty offences which the accused or the prosecution may elect to be tried on indictment, before a jury at quarter sessions. No offender under the age of 17 may be sentenced to imprisonment by a court of summary jurisdiction; but such young offender may be sent to a detention centre. Alternatively, he may be committed, in custody, to quarter sessions for sentence to a period of borstal training. First offenders should not be sent to prison; they are frequently placed on probation.

One J.P. or more may sit as a court of preliminary enquiry to determine whether there is a *prima facie* case (*i.e.* one that calls for a defence) against an accused which will require his being indicted before a jury. For this purpose the J.P.s take depositions (that is, evidence given (*see* D41) under oath, by prosecution witnesses, and reduced to writing and signed by each witness who has given it). If the J.P.s decide, at the end of the hearing, that the prosecution has disclosed no *prima facie* case, the accused is discharged; if there is such a case, then after due warning to the accused that he is not obliged to say anything but that, if he does answer the charge, anything he says will be written down and may be used in evidence at his trial, he is committed for trial, on bail or in custody (according to the gravity of the charge), at quarter sessions or assizes. (For restrictions on newspaper reports of such proceedings, see Criminal Justice Act, 1967 (D41(2)).

History of the Office of J.P.—The above is by no means an exhaustive account of the duties of J.P.s and of the procedure before them; but sufficient has been said to indicate the vital importance of their work. The office is both honorary and honourable; as early as 1327, in the reign of Edward III, the King appointed "conservators" of the peace within his Kingdom; and the Justices of the Peace Act, 1361, in the same reign, determined "what sort of persons should be Justices of the Peace and what authority they should have." From that day to this their duties have gradually become more difficult and extensive, as society has grown more complex. It would seem that, while there are many advantages in leaving the trial of the less grave offences to lay magistrates (as J.P.s are), the system, which for over six centuries has prominently figured in our penal practice, will be brought up to date and made more efficient by the proposed compulsory training. The only doubts have arisen on the ground that persons "of the best of reputation in the counties" (Act of 1344), who are prepared to give their time, without remuneration, to these public-spirited duties, may find it difficult, or in some cases impossible, to attend courses of training, in their spare time, in addition.

Recruitment of J.P.s.—The Lord Chancellor in his 1965 presidential address to the Magistrates' Association at Guildhall, London, said he would like to see the J.P.s recruited from more varied walks of life, a new system of training for the Bench and the abolition of the *ex officio* justices (*e.g.*, Mayors during their term of office). "The strength of the lay magistracy," he said, "is dependent on the ordinary man and woman realising that the Benches reflect all shades of opinion and are not representative of one section only." He said he would also like to see more coloured magistrates appointed. "There are now two coloured justices serving on the Bench and these appointments have both been tremendously successful."

FREE SPEECH AND PUBLIC ORDER

In the constitution of our parliamentary democracy (*see* D5) certain unwritten rules have been recognised for about three centuries past. These rules, which are not always easy to reconcile, may be summarised as follows:

(1) Free Speech.—Free and open discussion, *within the law*, ought to be permitted, both in private and in public, of all political, social, moral and religious questions.

(2) Unpopular Opinions.—Unpopular or minority opinions, *lawfully expressed*, privately or publicly, by act or word, *do not become unlawful* merely because their expression may induce *other people* to commit *unlawful* acts.

(3) **Provocation.**—Every man is presumed to *intend* the *natural consequences* of his acts; hence, the use of *threatening, abusive or insulting* language or behaviour, if it is *naturally* provocative of disorder, is *unlawful*.

(4) **Public Order.**—The *preservation of public order* is of paramount importance; a magistrate or police officer has a *right and duty* to take *any steps* necessary to *stop a breach of the peace* taking place, or to prevent a breach which he reasonably apprehends.

These rules have recently been widely discussed, as a result of the activities of political extremists who make a special feature of propaganda against racial or religious minorities. Some of their meetings and marches have been accompanied by grave public disorder.

Until comparatively recent times the whole subject depended upon common law decisions (D4), not statute law (D5). For example:

Unlawful Assembly is a common law offence, constituted by an assembly of three or more persons, intending either *to commit a crime* by open force, or to carry out any *common purpose, whether lawful or unlawful*, in such manner as to give *firm and courageous persons* in the neighbourhood *reasonable grounds* to apprehend a *breach of the peace* in consequence of the assembly. (The words "any *common* purpose, *whether lawful or unlawful*," should be noted.)

Sedition is a common law crime, which includes the doing of *acts* or the speaking of *words* with the *intention* of promoting feelings of *ill-will or hostility* between different classes of the Queen's subjects. If the words or acts (whatever the intention) have a *direct tendency* to cause *unlawful meetings or disturbances*, they are seditious, since "a man is *presumed to intend* the *natural* consequences of his acts" (see (3), above). This does not mean that there must be no full and free discussion, nor that there is any prohibition upon criticism, or even censure; but there must be *no malignity*, nor any imputation of *corrupt or malicious motives*, such as to incite people *to take the law into their own hands* and to provoke them to *tumult and disorder*

With these principles in mind, let us consider some actual cases (decided during the past eighty years) in which these rules have been applied.

Beatty v. Gillbanks (1882) arose from the activities of the newly-founded Salvation Army, which was "an association for carrying out religious exercises among themselves, and for a religious revival among certain classes of the community." Its leaders formed their followers into *processions* which marched through the streets of Weston-super-Mare, with *bands and banners*, collecting people as they marched back to their hall, where *prayer-meetings* were held. They were opposed on several occasions by an organisation calling itself the "Skeleton Army," which objected to these religious exercises. In consequence, disorders frequently arose, and the Salvation Army leaders were charged with "unlawfully and tumultuously assembling to the disturbance of the peace." The Magistrates bound them over to be of good behaviour; the Salvation Army appealed to the High Court.

The Judges decided that *the Magistrates were wrong*. "Everyone must be taken to intend the *natural* consequences of his acts" ((3), above) "and *if* this disturbance of the peace was the *natural consequence* of the Salvation Army's activities, they would have been liable, and the Magistrates would have been right to bind them over. But the evidence does not support this contention. . . . There was nothing in their conduct which was either tumultuous or against the peace; on the contrary, the evidence shows the disturbances were caused by other people, antagonistic to them. What has happened here is that an *unlawful organisation* has assumed to itself the right *to prevent* the Salvation Army from *lawfully assembling*, and the *decision of the Magistrates* amounts to this—that a man may be *convicted for doing a lawful act if he knows that his doing it may cause another to do an unlawful act*. There is *no authority* for such a proposition."

Wise v. Dunning (1902) is a contrasting case. A fanatical *Protestant clergyman* had, on several occasions, held meetings in parts of Liverpool containing a *strong Roman Catholic population*. At these meetings he had used *offensive, violent, and provocative language*, attacking the Pope and the Roman Catholic Church. In consequence, breaches of the peace had occurred, and the Liverpool Magistrate had bound him over to be of good behaviour. The Protestant clergyman appealed to the High Court, protesting that there was no evidence that he had committed or intended to commit a breach of the peace, and that the Magistrate's decision (as in the earlier case) was wrong. But the Judges *upheld the Magistrate's decision and dismissed the appeal*. The Lord Chief Justice said "there was abundant evidence that, in the public streets, he had used *language which was abusive*, which had *caused an obstruction*, and that he intended to do *similar acts* in another place." The two other Judges said that every case depends upon its own *facts* and *evidence*:

> "The law does not as a rule regard an illegal act as being the natural consequence of a temptation held out to commit it; but . . . the cases show that *the law regards the infirmity of human temper* to the extent of considering that a breach of the peace, although an illegal act, may be the *natural consequence* of *insulting or abusive* language or conduct".

The clergyman's behaviour (unlike that of the Salavation Army leaders in the earlier case) was *in itself violently provocative;* therefore the Magistrate was justified in binding him over, "under preventive power" to stop breaches of the peace, which were the "natural result" of his behaviour.

Both the above cases, as it happened, dealt with religious controversies. But the same rules apply in controversies of other kinds.

Duncan v. Jones (1936) was concerned with provocation on a *political and social* question. There was grave unemployment at the time, and feelings between the unemployed, and their supporters, against the Government, and its policies, ran high. Mrs. Jones had held a *meeting of unemployed* men right *opposite an unemployed training-centre*; she had made a speech strongly attacking the Government's policy, and a *disturbance had followed*. Fourteen months later, when she appeared at the *same place* for the *same purpose*, the Police Superintendent forbade her to hold the meeting there. She insisted on doing so, stepped on her box, and began to address the bystanders. It was not, at that stage, suggested that she was obstructing the highway, or inciting anybody to commit a breach of the peace. Nevertheless she was *convicted of obstructing* the Superintendent *in the execution of his duty*, and her conviction was upheld by the High Court. "She must have known (from earlier experience) the *natural consequence* of holding such a meeting at that place; the Superintendent *reasonably apprehended a breach of the peace;* it therefore became *his duty to prevent it*, and she was guilty of *obstructing him in carrying out that duty*."

The Public Order Act, 1936.—In the period preceding the Second World War, extremist political organisations held meetings at which they wore political uniforms and used "strong-arm" tactics similar to those in vogue among the Italian Fascists and German Nazis. They also indulged, like the Nazis, in virulent propaganda calculated to stir up racial hatred. As a result of the exasperation of public feelings, in the existing state of international tension, grave disorders took place in London and other cities. The situation was discussed in both Houses of Parliament and it was generally agreed that the law required to be *clarified and strengthened*. On December 18, 1936, the *Public Order Act* received the Royal Assent, and came into force on January 1, 1937.

Prohibition of Political Uniforms.—Section 1 of the Act (subject to certain exceptions) *forbids the wearing*, in a *public place* or at a *public meeting*, of *uniform* signifying the wearer's association with a *political organisation*, or with the promotion of a *political object*. (The exceptions are "ceremonial, anniversary or other special occasions" on which the Chief Officer of Police may permit a relaxation of the prohibition (with the Home Secretary's consent) only if he is satisfied that no risk of public disorder is likely to be involved.)

Prohibition of Quasi-Military Organisations.—Section 2 makes it an *offence* to participate in the *control or management* of an *association* whose members are (*a*) *organised* or *trained* or *equipped* to enable them to be employed "in usurping the functions of the police or of the armed forces of the Crown," or (*b*) *organised and trained*, or *organised and equipped* as follows: either (i) for the purpose of the use or display of *physical force* in promoting a *political object*, or (ii) in such manner as to arouse *reasonable apprehension* that they are *organised*, and either *trained or equipped*, for the purpose described in (i). (It was under (*b*) (ii) that two of the leaders of a present-day extremist political organisation were convicted and sentenced to imprisonment in October, 1962, at the Central Criminal Court; their appeals were dismissed.) The consent of the Attorney-General (the Senior Law Officer of the Crown) is required before a prosecution under Section 2 can be instituted. In certain circumstances a High Court Order may be made to search the premises of the organisation and to impound its property.

Preservation of Public Order on the Occasion of Processions.—Section 3 confers powers for this purpose, as follows:

(1) On a *Chief Officer of Police*, if he has *reasonable grounds* for *apprehending* that a *procession* may occasion *serious public disorder* (having regard to time, place and circumstances), power *to impose* on the organisers or participants in the procession such *conditions* as appear *necessary for preserving public order* (including the route of the procession and power to prohibit it from entering any "public place"); but no conditions restricting the display of *flags, banners or emblems* are to be imposed unless they are *reasonably necessary to prevent risk of a breach of the peace*.

(2) On a *Borough or Urban District Council* (if the Chief Officer of Police believes that his powers under (1) (above) will not suffice to prevent serious public disorder, and on application by him) power to *make an Order* (with the consent of the Home Secretary) *prohibiting* all *public processions*, or certain classes of public processions in the area for a period *not exceeding three months*. (This power does not apply within the City of London or the Metropolitan Police Area, as to which see (3) (below).)

(3) On the *Commissioner of the City of London Police*, and the *Commissioner of Metropolitan Police*, a power similar to that described in (2) (above), and on similar conditions. Thus, within the *London Area* the *Police Authorities*, and in *urban areas outside London* the *Local Authorities*, are given *power to prohibit processions* (or "marches") on the conditions described in (2) above.

It is an *offence* for anybody *knowingly to fail to comply* with any *Order* or *condition* imposed, *or to organise* or *assist in organising* a public procession *in contravention* of the Section.

Prohibition of Offensive Weapons.—By Section 4, anybody is guilty of an *offence* if he has with him any *offensive weapon* at a *public meeting* or *on the occasion of* a *public procession*, without lawful authority. (Note the words "*on the occasion of* a public procession": it is *not only those taking part* in the procession, *but also bystanders*, who may commit this offence.) "Lawful authority" extends to servants of the Crown, Members of Parliament or of a Local Authority (acting as such), police officers, members of Fire Brigades or Cadet Corps, and so forth.

Prohibition of Offensive Conduct Conducive to Breaches of the Peace.—Section 5 (as now amended by the Race Relations Act, 1965) reads—"Any person who in any public place or at any public meeting (a) uses threatening, abusive or insulting words or behaviour, or (b) distributes or displays any writing, sign or visible representation which is threatening, abusive or insulting with intent to provoke a breach of the peace, or whereby a breach of the peace is likely to be occasioned, shall be guilty of an offence."

Disorderly Conduct at a Public Meeting.—Section 6 refers to the **Public Meeting Act, 1908**. Section 1 of the 1908 Act makes it an offence for a person to *act in a disorderly manner* at a *lawful* public meeting for the purpose of *preventing the transaction of the meeting's business*. Section 6 of the 1936 Act gives power to a constable, if he *reasonably suspects* an offence under the 1908 Act, *to demand* of the suspected offender his *name and address* (provided that the chairman of the meeting requests him to do so). If the suspected offender *refuses* or fails to give his name and address, or gives a *false name and address*, he *commits an offence*, and the constable may arrest him without warrant. (Note that, to qualify for protection, the public meeting must in the first place, be *lawful*.) Section 6 of the 1936 Act has been considerably extended and strengthened by Section 6 of the Race Relations Act, 1965, for stirring up hatred on grounds of race or colour. The **Public Order Act, 1963**, has greatly increased the penalties under Section 5 of the Act of 1936 and Section 1 of the Act of 1908; but an undertaking has been given by the Home Office that the new Act will not be used to suppress mere "heckling" at a public meeting.

Jordan v. Burgoyne (1963) was similar to *Wise v. Dunning* (1902), except that the 1963 case was concerned with section 5 of the Public Order Act, 1936. At a *public meeting* in Trafalgar Square, to an audience of 5,000, *which included many Jews*, Colin Jordan used the words—"Hitler was right. Our real enemies—the people we should have fought—were not the National Socialists of Germany, but World Jewry and its associates." There was *complete disorder* and a general surge towards the speaker by the crowd, but they were restrained by the police, under Superintendent Burgoyne; and 20 arrests were made while the crowd was being dispersed.

Before the Bow Street Magistrate Jordan was convicted and sentenced to imprisonment, for "*using at a public meeting insulting words whereby a breach of the peace was likely to be occasioned.*" He appealed to Quarter Sessions, who found as a fact that, though *the words were highly insulting*, they were *not likely to lead ordinary responsible persons to commit breaches of the peace*; they therefore allowed Jordan's appeal against conviction. The prosecution then asked for "a case to be stated" for the High Court on the question whether the words in section 5 could properly be interpreted to mean "likely to lead to a breach of the peace by ordinary citizens."

The Lord Chief Justice, with two other Judges, decided that *Quarter Sessions were wrong*. *The test was not* whether the insulting words were likely to cause a breach of the peace by a *hypothetical audience*, whatever their creed, faith, race, or political views; in any case the Judges imagined that any *reasonable citizen would be provoked* beyond endurance. But this was an *Act to keep order in public places*, and "a speaker must *take his audience as he finds it*. If those words to that audience are likely to provoke a breach of the peace, the *speaker is guilty of an offence*. The right of *free speech is not in question*; he *may express his views as strongly* as he likes, *but he must not threaten, abuse or insult that audience*." The case was sent back to Quarter Sessions with a direction to find the offence proved, and to dismiss Jordan's appeal from the Magistrate's conviction. *See* D44.

D. LAW REFORM

The Lord Chancellor, among his many duties, acts as a sort of Minister of Justice. The present Lord Chancellor is an enthusiastic reformer; the setting up of the Law Commission (D5(2)) was on his initiative. Many recommendations of the Law Commission, and fresh legislation resulting from them, have been noted under their various headings in the main text of the section. Further new legislation is referred to below.

Law of Contract–Misrepresentation (D10(2))

By the **Misrepresentation Act, 1967,** if a person enters into a contract (later than April, 1967, when the Act became law) after a misrepresentation has been made by the other party, and:

(*a*) the misrepresentation has become a term of the contract, or

(*b*) the contract has been carried out, or both,

then, if under the old law he would have been entitled to rescind (*i.e.*, cancel) the contract without alleging fraud, he shall be entitled to do so, in spite of (*a*) and (*b*).

(*Note:* Under the old law, once the contract had been carried out, his only remedy was damages, if he had suffered loss.) It is now provided that where such misrepresentation has been made to a person as a result of which he has suffered loss, then the other party shall be liable to damages even if there was no fraud (*i.e.*, deliberate deceit), unless he proves that he believed, on reasonable grounds, up to the date of the contract, that his representations were true. In any case the Court may award damages instead of, or in addition to, rescission, if the Court thinks it equitable to do so (D4–5), whether the misrepresentation was innocent or fraudulent.

If an agreement is made containing a clause excluding or restricting liability for misrepresentation, that clause shall be ineffective unless the Court thinks it fair and reasonable. In sales of goods rescission and/or damages are to be available to the buyer even after he has become the owner of the goods. And he is not deemed to have accepted them until he has been afforded and has had a reasonable opportunity of inspecting them to ascertain whether they conform to the contract or not.

(*Note:* This Act is expected to remove abuses, particularly at some auction sales, where the sellers, in their catalogues, have been reckless in attributing a work of art to a particular artist, and have excluded liability for misdescription in the contract.)

Criminal Law and Procedure (D6–7)

In earlier editions we published in this section an article entitled "Crime and Punishment in a Changing Society." Many of the proposed reforms referred to have now been carried out by Parliament.

The Criminal Justice Act, 1967, which contains 106 sections and 6 schedules, revolutionises many provisions of criminal law and procedure:

Secs. 1–2.—Magistrates or J.P.s conducting a preliminary inquiry to determine whether there is a *prima facie* case for Quarter Sessions, Assizes or the Central Criminal Court (D44) may commit an accused for trial on written evidence, signed by the witness(es) who made the statement, and declared by them to be true, provided that a copy is handed to the defendant(s), solicitor, or counsel, none of whom objects; but only if the accused is represented by counsel or solicitor. (The statement must be read over to any person who cannot read it.) If the witness is under the age of majority, it must state his age. (The purpose is to save spending time in giving evidence by word of mouth at the preliminary hearing.) In any case the Court may require such witness to give evidence by word of mouth, either on its own initiative or on the request of any party.

Sec. 9.—The same applies to the trial itself, and admissions are to be good evidence.

Secs. 3–5.—Although the examining justices must sit in open Court, no report of the proceedings may be published, unless (*a*) one of the accused so requests, or (*b*) the magistrates discharge the accused, or (*c*) a brief summary of matters excluding evidence is printed. Penalty for unauthorised publication is £500. (*Note:* The purpose of these provisions is to avoid prejudice to the accused at the main trial.) Notice of discharge or committal must be displayed after the preliminary hearing. Any permitted publication is privileged.

Sec. 8.—A Court shall not be bound to infer intention or foresight of the results of the accused's actions, but in every case shall decide whether that particular accused did intend or foresee them, on the whole of the evidence. (This reverses a decision in 1962, *Director of Public Prosecutions* v. *Smith*, where the House of Lords inferred an intent to kill from the mere fact that the accused accelerated a car and drove with a policeman clinging to the bonnet. That decision was much criticised; the new law is that the prosecution must prove the action and the intention.)

Sec. 11.—Notice of the defence of *alibi* must be given to the prosecutor at least 7 days before the end of the committal proceedings, except with leave of the Court. (This is intended to avoid an alibi being "sprung" on the prosecutor at the last moment, when he cannot disprove it.)

Secs. 12–15.—Verdicts of juries need no longer be unanimous. If there are not less than 11 jurors, 10 may return a verdict; if there are 10, 9 may do so. But the jury must be allowed at least 2 hours for deliberation. Persons who have served a term of at least 3 months imprisonment (or in a borstal), summarily, or who have been sentenced to at least 5 years or for life (which usually means about 12 years), are disqualified from serving on a jury—penalty £25; but a verdict is not to be held void because of such disqualification. (These provisions are intended to prevent pre-corruption of jurors.)

Secs. 18–23.—Magistrates hearing an indictable offence (D38(2)), may no longer refuse bail to an accused over seventeen, on remand or committal, or in certain other cases. No J.P. may take part in the trial if he knows of previous convictions (to avoid prejudice). A constable may arrest without warrant any person who he believes is likely to break his bail. If the J.P.s refuse bail, the accused may apply for bail to the High Court.

Secs. 26–28.—A Magistrates' Court shall not sentence an accused to imprisonment in his absence. And they may try a summary offence (D38) for which he could be tried in the area in which the offence was committed.

Secs. 37–42.—Preventive detention and corrective training are abolished as is also (Sec. 65) corporal punishment in prisons. Suspended sentences may be passed: if the accused commits a further offence, he may have to serve the suspended sentence.

Secs. 43–50.—Magistrates may now impose fines up to £400 (instead of £100). Imprisonment in default of payment is abolished, except when the accused has means to pay but will not. Instead, enforcement shall be by seizing his goods, or by deduction from his earnings (D32(1)). (*Note:* These provisions are to avoid overcrowding in prisons. "Conditional discharge" may be substituted for probation orders.)

Secs. 57, 58.—The Home Secretary may make rules requiring a "Social inquiry report" before sentence. Deportation of a Commonwealth immigrant may be substituted for imprisonment for life.

Secs. 59–72 give power to release prisoners on licence, to revoke such licence, to remand or release young offenders to or from detention or approved schools. (These provisions have the purpose of preventing overcrowding in such institutions.)

Secs. 73–85 give details of arrangements for legal aid in suitable criminal cases.

Secs. 85–88 make it an offence to sell or give shot-guns to unauthorised persons.

Secs. 95–96 extend probation arrangements.

Secs. 97–98 reform the rules relating to Criminal Appeals.

Criminal Law (D6(1))—categories (*a*) and (*b*).

The Criminal Law Act, 1967, came into operation on January 1, 1968. Its main provisions affect the text on D6 in the following ways: Except for the offence of treason, the old distinction into felonies and misdemeanours is abolished; the expressions "indictable" and "summary" offences are retained, but for some purposes offences are divided into "arrestable" and "non-arrestable" offences. Arrestable offences are those for which (i) the sentence is fixed by law; those for which (ii) the offender is liable to five years imprisonment, and those which (iii) there has been an attempt (D6(2)–(b)) to commit. Arrestable offences, therefore, now include practically every variety of grave crime. Others are known as non-arrestable offences.

The rule stated in the text under "Joint Crimes" (D6(2))—that all accessories and principals are to be regarded as equally guilty, and subject to the same punishment, applies from January 1, 1968, to all offences, except treason. But the offence of being an accessory after the fact (except in treason) is abolished; instead, a new offence of "assisting offenders" is created (Sec. 4(1)), providing that "where a person has committed an arrestable offence, any other person who, knowing or believing him to be guilty, does, without lawful authority or reasonable excuse, any act with intent to impede his apprehension or prosecution" shall be liable to periods of imprisonment proportionate to the sentence for the main offence. Where the arrestable offence is itself triable summarily (*i.e.*, by a Magistrates' Court) with the defendant's consent, then the offence of "assisting" is also so triable. But the proceedings may be brought only by or with the consent of the Director of Public Prosecutions. A husband or wife has no special exemption.

By Sec. 5(1) a new crime of "concealing arrestable offences" is created. In effect the new offence amounts to the prohibition of accepting a bribe in consideration of such concealment, and the consent of the Director of Public Prosecutions must be obtained beforehand, if a prosecution is contemplated. The defendant must know or believe that his information might be of material assistance in securing the conviction of an offender. But the common law rule that "you may show mercy but shall not sell mercy" is modified, so that it is not unlawful to agree not to prosecute or give information on condition that the offender makes good any loss or injury caused by his offence, or makes reasonable compensation for it. It remains unlawful to help to conceal any act of treason.

A new summary offence is created under the Act—the making of false reports to cause wasteful employment of the time of the police in regard to any kind of alleged offence. (Hitherto such false reports have sometimes been dealt with under the heading of "public mischief", and this kind of offence is not affected by the Act.)

Power is given to award compensation to the injured party, in case of any indictable offence, up to the sum of £400 (but compensation for damage due to an accident arising out of the presence of a motor vehicle on a road is excluded; such claims are covered by compulsory insurance). Such compensation may be awarded by the Court trying the offence.

Powers of arrest: Any person may now arrest (i) anyone who is in the act, or whom he suspects to be in the act, of committing an arrestable offence, and (ii) where an arrestable offence has been committed, anyone who is guilty, or whom he suspects to be guilty, of the offence. A constable may without warrant arrest (i) where he suspects with reasonable cause that an arrestable offence has been committed, anyone whom he, with reasonable cause, suspects to be guilty, and (ii) anyone who is about to commit, or whom the constable, with reasonable cause, suspects to be about to commit an arrestable offence. Other common law powers of arrest, such as to prevent violence or breach of the peace, are unaffected by the new Act. A constable may enter (if necessary by force) and search any place where anyone (whom he has the right to arrest) is or where, with reasonable cause, he suspects him to be. (Other existing rights to enter are unaffected.) A person may use such force as is reasonable in the circumstances in the prevention of crime or in effecting or assisting in the lawful arrest of offenders or suspected offenders or of persons unlawfully at large. (This power is not restricted to constables, nor in actual terms to indictable offences; but the words "such force as is reasonable in the circumstances" prevent or, by implication, forbid the use of force for arrest in the case of trivial offences.)

The common law offence of receiving is defined as follows: "A person shall be treated as receiving property if he dishonestly undertakes or assists in its detention, removal, or realisation by or for the benefit of another or if he arranges so to do."

Sexual Offences Act, 1967.

Male homosexual practices are no longer an offence if committed in private between consenting adults, except on merchant ships; but living on the earnings of a male prostitute is still liable to punishment from 6 months to 3 years imprisonment. (Female homosexual practices have never been an offence.) If an adult commits a homosexual act with a minor over 16, imprisonment is for 10 years, unless the minor consented, in which case it is 5 years (instead of life imprisonment). If the minor is under 16, the penalty is 10 years. No proceedings may be brought more than 12 months after the act was committed, nor without the consent of the Attorney-General. (This is to avoid blackmail.)

Abortion Law Reform

The Abortion Act, 1967, provides for an abortion to be performed by a registered medical practitioner if two registered medical practitioners are of the opinion:

> (1) that the continuance of the pregnancy would involve risk to the life of the pregnant woman, or of injury to the physical or mental health of the pregnant woman or any existing children of her family, greater than if the pregnancy were terminated; or
>
> (2) that there is substantial risk that if the child were born it would suffer from such physical or mental abnormalities as to be seriously handicapped.

The Act states that in determining whether the continuance of a pregnancy would involve risk of injury to health as is mentioned in (1) above, account may be taken of the pregnant woman's actual or reasonably foreseeable environment. (The provision under (1) for a termination on the grounds of injury to the health of other children in the family became known as the "social" clause during the course of the debate on the Bill).

The Act provides for abortions to be carried out in National Health Service hospitals or in premises approved by the Minister of Health or the Secretary of State for Scotland, unless a termination is immediately necessary. Notification must be made of all abortions carried out.

THE WORLD OF MUSIC

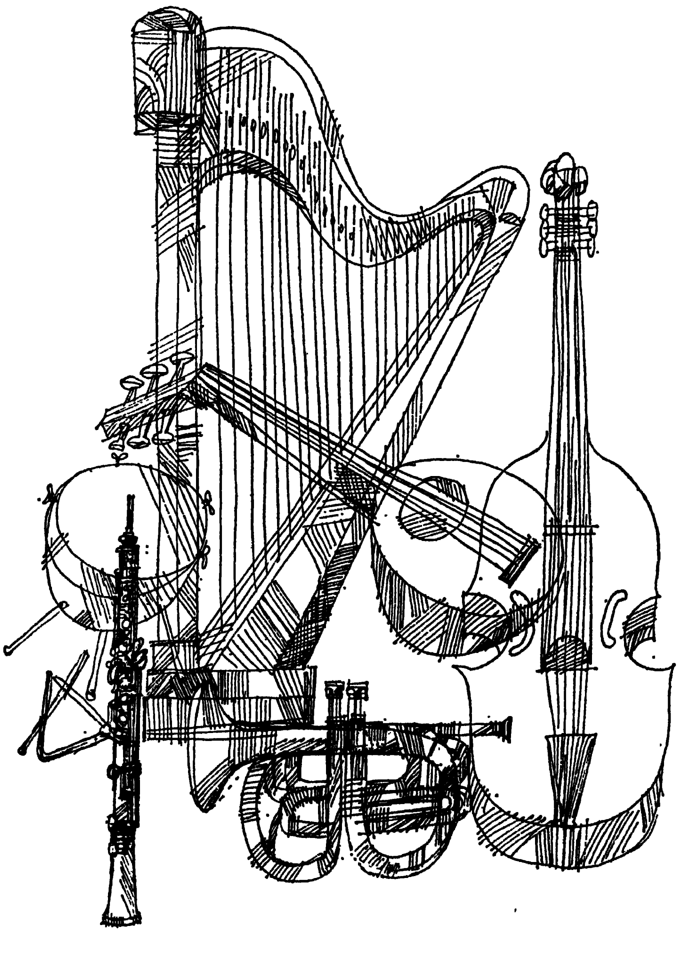

TABLE OF CONTENTS

THE WORLD OF MUSIC

This section is concerned with the art of music as it has developed in the Western world. It assumes no special knowledge on the part of the reader and is for those who want to know about the history of music, how different styles evolved, and how one composer influenced another. It is a background to music as the science section is a background to science, and just as the latter cannot show the reader the colours of the spectrum but only tell of Newton's experiments and of the relationship between colour and wavelength, so in this section we can only describe man's achievements in the world of sound. But knowing something about a composer, his work, and when he lived can help to bring fuller understanding and enjoyment when listening to his music.

The section is in three parts:

I. HISTORICAL NARRATIVE AND DISCUSSION

The history of music, like that of any people or art, is not one of uninterrupted progress towards some ideal perfection. For five centuries or more music in the West has achieved peaks of accomplishment in one style or another before society has dictated or composers have felt the need for something new and different. Thus Wagner's music-drama *Parsifal*, lasting five hours, is not necessarily a more rewarding work than what Monteverdi achieved in *Orfeo* 250 years earlier. More complex yes, more rewarding—well, that is for the listener to judge.

We must keep this in mind when considering the development of music from a starting point of, say, Gregorian chant down to the complicated structures of a Schoenberg in our own day. In this development there is no true dividing line between one period and another, nor must simplifying terms such as "classical" or "romantic" be taken too literally.

The earliest history of Western music as we know it today is closely bound up with the Church, for music had to be provided for services. The earliest Christian music was influenced by Greek songs, few of which unfortunately have survived, and by the music of synagogues, where the art of chanting originated. The modal system of the ancient Greeks was highly organised. The earliest Greek scale was from A to A and the four descending notes A,G,F,E became the basis of their musical theory, and it is from them that Western music learned to call notes after the letters of the alphabet. A scale can begin on any note and always includes two semitones upon which much of the character of a melody depends.

The Greek modes were based on the white notes only; the Dorian, Phrygian, Lydian, and Mixolydian began respectively on E,D,C, and B. Their character was thus decided by the position of the semitones, and they formed the basis, often corrupted, of the mediaeval modes. This system was transmitted through Latin writers such as Boethius and Cassiodorus, and through Arabic writers. The eight Church modes were not established until the 8th or 9th cent. These plagal modes, as they are called, started in each case, for technical reasons, a fourth below the authentic modes.

By the end of the 6th cent. Gregorian chant had developed so far that some sort of permanent record was required. *Neumes*, signs placed over the Latin text, were the earliest attempt at musical notation. Gradually lines came into use until a four-line stave was established, probably in the 11th and 12th cent., and with them clef signs, although the treble clef as we know it today did not appear until the 13th cent.

And what is this music—plainchant—like? It is an unaccompanied, single line of melody, which, when we have become used to its "antique" flavour is heard to have a wide range of spiritual and emotional expression, not excluding word painting. The texts used came from the Liturgy. These beautiful, extended lines of flowing, flexible melody can still be heard on Sundays in Roman Catholic cathedrals and churches.

Polyphony is Born.

The 10th cent. saw the appearance of a book called *Musica Enchiriadis* (whose authorship is disputed) which introduced theories about unison singing in which the melody is doubled at the fourth or fifth. Organum, or diaphony, is used to describe this method of writing, a term which confusingly could also be used for a kind of singing where melismatic melody was heard over a drone note on the organ. Rules came into fashion defining which intervals were allowed and which parts of the church services could be sung in more than one part. By the time of Guido d'Arezzo (*c.* 990–1050), a Benedictine monk who helped advance notation, contrary motion was permitted as the cadence was approached, another technical advance. Gradually the voices became more and more independent, and the third, so long considered a discord, came into use. Pérotin, of Notre Dame, was the first composer to write for three and four voices, and he and his great predecessor Léonin were the great masters of early polyphony. The proximity and spikiness of Pérotin's harmony is almost modern-sounding, and as with Gregorian chant, once we have adjusted ourselves to the sound, this music can be a rewarding experience.

Early Secular Music.

In mediaeval France, towards the end of the 11th cent., there developed what has become known as the age of the troubadours, poet-musicians. They were the successors to the *jongleurs*, or jugglers, and minstrels about whom we know little as practically none of their music has survived. The troubadours hymned the beauty of spring and of ladies. Contemporary with them in Germany were the Minnesingers. Their songs were mostly set in three modes. Adam de la Halle (d. 1287), because so much of his music survives, is perhaps the best-known of the troubadours. He was a notable composer of *rondels*, an early form of round, of which the English *Sumer is icumen in*, written by a monk of Reading *c.* 1226, is a fine example.

Ars Nova.

The term *ars nova* derives partly from writings of Philippe de Vitry (1291–1361) who codified the rules of the old and the new music in a valuable treatise. This *new art* represented a freeing of music from organum and rhythmic modes, and an increase in the shape and form of melodic line. France was the centre of music during the 14th cent. and apart from Philippe de Vitry the leading composer was Guillaume de Machaut (1300–77), who wrote many secular works as well as a polyphonic setting of the Mass. His music is notable for its vigour and tenderness as well as for its technical expertise. Meanwhile in 14th-cent. Italy a quite separate branch of *ars nova* was developing. Imitation and canon were to be noted in the music of Italian composers, and choral forms such as the Ballata, Madrigal (which often included instrumental accompaniment) and Caccia (a two-voice hunting song in canon) were common. The greatest Italian composer of this period was the blind organist and lutenist Francesco di Landini (*c.* 1325–97).

England was less affected by *ars nova* and tended to remain loyal to older forms. Not until the 15th cent. did she begin to make a significant contribution to the history of music. Both John Dunstable (*c.* 1380–1453), who was no less eminent as a mathematician and an astronomer than as a musician, and his contemporary Lionel Power advanced the technique of music by their method of composition (use of the triad, for instance) and mellifluous style. Their musicianship was much appreciated on the Continent. Dunstable did away with the use of *cantus firmus*—a fixed melody—and increased the use of free composition.

After Dunstable the next great figure in European music was Guillaume Dufay (*c.* 1400–74), the most celebrated composer of the Burgundian school. His music is distinguished for its blend of flowing melody, cleverly wrought counterpoint and tender expressiveness. Much travelled, Dufay was a man of catholic outlook. Together with Dunstable and the Burgundian Gilles Binchois he bridged the gap between 14th cent. *ars nova* and the fully developed polyphony of the 15th cent.

Ars nova composers also showed an interest in secular music and many of their *rondeaux* and *chansons* (those of Binchois particularly) have been preserved. Personality began to play a distinguishing part in composition.

The results of Dufay's good work can be heard in the flowering of the Franco-Netherland school later in the 15th cent. Its two most notable representatives are Ockeghem (c. 1420–95) and his pupil Josquin des Prés (*c.* 1450–1521), who carried musical expressiveness even further than Dufay; their work can also be grand and majestic. Indeed Josquin's wide range, from the humorous to the dignified, partially accounts for his justly deserved high reputation. He was a master of counterpoint but tempered his mechanical ingenuity with imaginative insight.

Throughout the Renaissance choral music was breaking away, as we have seen, from its earlier bonds. The mediaeval tradition of having the *cantus firmus* in the tenor went by the board; the use of dissonance, when only two voices were used in mediaeval times, was abandoned in favour of euphony; and all the voices, democratically, came to share the musical lines. Composers also began to respect their texts; where words were previously fitted to the music, the reverse was now the case. In Josquin's music, indeed, we have the first attempts at symbolism: matching verbal ideas with musical ones. The importance of this musical renaissance has been realised only over the past twenty years. At last the Renaissance composers are coming to be seen not merely as historical figures relevant only in so far as their work culminated in the great classical composers, but as masters in their own right, whose music should be nearly as familiar to us as is that of a Mozart or a Beethoven.

With the exception of Dufay, little is known of the lives of the musicians so far mentioned. Most of them were in the service of royal or ducal households where they were in charge of the chapel choir, or else they worked in or around the great cathedrals, teaching at choir-schools. They were well rewarded for their services and their social position was probably high.

The Sixteenth Century.

By the 16th cent. music in England was a steadily expanding art and much encouraged. Music-making in the home was becoming quite the fashion in social circles. The Chapels Royal remained the chief musical centres but the music was changing with the development of new secular forms so that it was not so much religious as a part of life. Composers began their lives as choirboys and received a thoroughgoing education, both theoretical and practical.

Carrying on from where Josquin and his contemporaries left off, Palestrina in Italy, Victoria in Spain, Lassus in the Netherlands, and Byrd in England brought the polyphonic style to its zenith. At the same time came the rise of the madrigalists, first in Italy, then in the Netherlands; and then the beginnings of instrumental music as it came to be known in the succeeding centuries.

The vocal composers began to use chordal (homophonic) as well as contrapuntal (polyphonic) methods of writing—examples are Victoria's *Ave Verum Corpus* and Palestrina's *Stabat Mater*—but polyphony was still the fullest most magnificent instrument of composition, as for instance in Byrd's *O Quam Gloriosum* which shows an eager response to the mood and to the inflection of the words in a kind of vocal orchestration. A feature of all these composers' music, but more especially that of Victoria (*c.* 1535–1611) and Palestrina (1525–94), is its serene simplicity and fervour of utterance. Palestrina was perhaps more spacious in his effects, Victoria the more passionate. How well we can imagine—and sometimes hear—their music resounding down the naves of the great cathedrals of Europe.

The music of Lassus (*c.* 1530–94) is distinguished both in sheer amount and in vitality. His mastery in the field of motets was unrivalled, encompassing a wide range of subject and mood. He and his fellow Flemish composers, Willaert, de Monte and Arcadelt, were also expert in the Madrigal, a form popular in Italy and England as well. The Madrigal was a contrapuntal setting of a poem, usually not longer than twelve lines, in five or six parts. The subject (of the poetry) was usually amorous or pastoral. It was a short-lived, but highly prolific vogue. Orlando Gibbons (1583–1625), Thomas Weelkes (*c.* 1575–1623), and John Wilbye (1574–1638) were the most prominent English exponents.

Instrumental Music.

By the end of the 14th cent. instrumental music began to become something more than mere anonymous dance tunes or primitive organ music. Instruments often accompanied voices, or even replaced them, so that the recorder, lute, viol, and spinet indoors, and sackbuts and shawms outdoors, had already been developed by the time instrumental music came to be written down. Gradually a distinction grew up between what was appropriate to the voice and what was suitable for instruments. Byrd, Gibbons, and Giles Farnaby in England, the great blind keyboard player, Cabezón (1510–66) in Spain, and Frescobaldi (1583–1643) in Italy produced valuable instrumental works. Perhaps the *Parthenia* and the *Fitzwilliam Virginal Book*, collections of Early English Keyboard music, give as fair a representative idea as any of the development of instrumental form at this time.

In chamber music musicians often played collections of dance tunes strung together to make a whole; or they chose fantasies (or " fancies "), where a composer altered a tune as he wished. Then there were sets of variations on a ground,

that is a simple tune played over and over again on a bass viol.

As far as brass instruments are concerned, they were often used on festive occasions in spacious halls or in cathedrals. The Venetian composer Andrea Gabrieli (*c.* 1510–86) was the first to combine voice and instruments and his son Giovanni Gabrieli (1557–1612) carried the process further to produce sacred symphonies, often using antiphonal effects.

Drama in Music.

Not until the end of the 16th cent. did anyone begin to think about combining drama and music, and so " invent " the new art we know today as opera. A group of artistic intelligentsia met together in Florence and conceived the idea of reviving the ancient declamation of Greek tragedy. They took Greek mythological subjects, cast them in dramatic form, and set them to music, not in the choral polyphonic style of the Madrigal, but with single voices declaiming dialogue in music. The earliest examples of what was called *Dramma per Musica* were Peri's *Daphne* in 1597 (now lost) and his *Eurydice*, in which he co-operated with Caccini. The new style came to its full flowering with the appearance of Monteverdi (1567–1643), whose genius would surely have shone in any age.

Monteverdi's first opera, *Orfeo*, produced in 1607, is a landmark of dramatic expression, and it is nothing less than a catastrophe that so many of his later operas have been lost. His *Orfeo* provides the basic ground work for the operas of the next two centuries: recitative, accompanied recitative, and aria. His last opera *L'Incoronazione di Poppaea*, written when he was at the great age (for those days) of 75, succeeds in its aim of creating a free, fluid form, slipping easily from recitative to arioso and even aria without the strict, closed forms that were to be used in the 17th and 18th cent. He focusses attention to an almost unbelievable extent on character rather than situation. He creates real people with all their faults and foibles—the kittenish, sexually attractive Poppaea, the power-drunk, infatuated Nero, the wise counsellor Seneca, and the noble, wronged empress Octavia. As recent productions have shown these characters leap from the musical page as if they had just been created, each unerringly delineated in musical terms. Only the vocal line, the continuo, and very incomplete instrumental ritornelli parts have been preserved, but in sensitive, knowledgeable hands tonal variety in the shape of wind and string parts can be added, as we know certain instruments were available to the composer.

Monteverdi's successors were Cavalli (1602–76), Cesti (1623–69) and Stradella (1642–82), who gave the solo voice more and more prominence encouraged by the advent of the castrati's brilliant voices. These artificially created singers had a vogue and popularity similar to " pop " singers of today, fêted wherever they appeared. The aria became more extended and ornate, and dramatic verisimilitude gradually but inexorably took second place to vocal display. An aria was nearly always in *da capo* form, the first section being repeated after a contrasting middle one.

Sixteenth- and Seventeenth-century Church Music.

Of course, the invention of a new dramatic style affected church music too. The concentration on the vertical aspect of music (homophony) as opposed to the horizontal (polyphony) led to the increasing importance of the voice in religious music. In Italy, it is true, there was the late-flowering, great madrigalist Carlo Gesualdo (1560–1614), whose harmonic daring still astonishes us today, but by 1600 the cantata was coming to replace older forms in church music. In its simplest form this was a story told in accompanied recitative. Giacomo Carissimi (*c.* 1604–74) was one of the first significant composers of this new form. He too was in on the birth of the oratorio, whose forerunner was the *sacra rappresentazione* (mystery or miracle play) of early 16th-cent Florence. Then in the mid-16th cent. St. Philip Neri brought in elements from popular plays on sacred subjects in his services in Rome, designed to hold the attention of youth—rather as certain parsons have tried with " pop " services today. Emilio di Cavalieri (*c.* 1550–1662) and Carissimi developed the form adding arias and choral movements, omitting actual representation. Alessandro Scarlatti (1660–1725), whose oratorios bear a close resemblance to his operas, brought oratorio to its zenith in Italy.

Heinrich Schütz (1585–1672), Bach's great predecessor, was the founder of German church music. His historical place has never been called into question but only in recent times have the intrinsic merits of his own music come to be recognised. He studied with Giovanni Gabrieli in his youth and later came under the influence of Monteverdi, so it was not surprising that he brought Italian ideas across the Alps to Germany and wrote the first German opera *Daphne*, now sadly lost. He also introduced his country to the Italian declamatory style and to the new kind of concertato instrumental writing. But his dramatic religious works were his greatest contribution to musical development. He wrote with a devout intensity, bringing to life the scriptural texts by closely allying his urgent music to the words. His three settings of the Passions—Matthew, Luke, and John—paved the way for Bach's even more remarkable works in this genre. Two contemporaries of Schütz, Johann Hermann Schein (1586–1630) and Samuel Scheidt (1587–1654), were both important figures in German Reformation music.

Lully, Purcell, and Seventeenth-century Opera.

France resisted the tide of Italian opera, although paradoxically it was an Italian, Jean-Baptiste Lully (*c.* 1632–87), who charted the different course of French opera which was from the beginning associated with the court ballet. His musical monopoly during the reign of Louis XIV was put to good use. In his thirteen operas the libretto, usually on classical, allegorical themes, plays a vital part in the composition, which is therefore less clearly divided between recitative and aria than in Italian opera. The orchestration and the ballets assume greater importance than in the traditional Italian form. It was, in short, a more realistic, less stylised art.

In England, opera developed out of the entertainment known as the Masque, a succession of dances, accompanied by voices and instruments and often incorporated in a drama or spectacle. Henry Lawes's (1596–1662) setting of Milton's *Comus* is probably the most famous of these entertainments. The *Venus and Adonis* of John Blow (1649–1708) can be called the first English opera because here the music is gradually gaining the ascendancy over the spoken word. However, it was Purcell (1658–95), Blow's pupil, with *Dido and Aeneas*, who really gave dramatic life to the new medium by giving his characters a true musical personality that was subtler than anything the mere spoken word could achieve. The grief-laden lament of the dying Dido " When I am laid in earth " has an expressive power, achieved by extraordinarily bold harmonic effects, never before and seldom since achieved. The opera was in fact written for a young ladies' boarding school. Purcell followed it with several outstanding semi-operas—such as *The Fairy Queen* (to Dryden's text). His untimely death at the age of 36 probably robbed us of several full-length operas—and perhaps a consequence of this was that English music after him did not develop as it should have done.

His verse anthems and much of his instrumental music, especially the Fantasias, are also rich in imaginative mastery through his original use of harmony and counterpoint. However, a great deal of his pieces were written for a specific occasion and many of the odes are set to impossibly trite texts. At least his genius was partly acknowledged in his own day, and he was appointed organist in Westminster Abbey where he was buried with due pomp. He is said to have died through catching cold when locked out of his own house at night.

Vivaldi and the Rise of Instrumental Music.

Out of the dance suites popular in the 16th cent. and the beginning of the 17th (known in Italy as the *Sonata da Camera*) developed the concerto. This began as two groups of instrumentalists compared and contrasted with each other as in Giovanni Gabrieli's *Sonata piano e forte*. With Arcangelo Corelli (1653–1713) the concerto grosso took a more definite shape, alternating a solo group of instruments with the main body of strings in three or more contrasting movements. Guiseppe Torelli (1658–1709), Francesco Geminiani (1687–1762) and Tommaso Albinoni (1671–1750) were other notable contributors to the form, but none of the composers so far mentioned has today achieved the popularity of the priest Antonio Vivaldi (*c.* 1678–1741), himself a violinist, who had at his disposal the orchestra at the Ospedale della Pieta in Venice. The young women at this music school also contributed the vocal side of the concerts there of which there are many descriptions. One says: "They sing like angels, play the violin, flute, organ, oboe, cello, bassoon—in short no instrument is large enough to frighten them . . . I swear nothing is so charming than to see a young and pretty nun, dressed in white, a sprig of pomegranate blossom behind one ear, leading the orchestra, and beating time with all the grace and precision imaginable." For this body, Vivaldi wrote about 500 concertos which maintain a remarkably even quality, of which "The Four Seasons" are perhaps the most felicitous.

Meanwhile organ music was advancing rapidly in technique. Girolamo Frescobaldi (1583–1643) and Jan Pieterszoon Sweelinck (1562–1621) wrote works that provided the foundation of the Italian and Northern German schools of organ music. Their ricercares gradually developed into the fugue, a vein so richly mined by Bach. Among their successors the most notable figure before Bach was Johann Pachelbel (1653–1706).

Other keyboard music, especially for the harpsichord, was the particular province of France and Jean-Philippe Rameau (1683–1764) and François Couperin (1668–1733) were both masters of keyboard style and harmonic invention.

Bach (1685–1750).

The two giant figures of Bach and Handel bestride the first half of the 18th cent. Their differences are perhaps greater than their similarities. Bach wrote essentially for himself (although of course, he had to satisfy his employers at Cöthen and Leipzig) while Handel was composing to please his wide public. Bach was a provincial, always remaining in central Germany; Handel was widely travelled. Bach was devoutly religious, almost ascetic; Handel was more a man of the world. They never met.

To summarise Bach's vast output in a short space is virtually impossible. One can only try to distil the flavour of his music. He brought the art of polyphony to the highest pitch of mastery that has ever been achieved or is ever likely to be achieved. In his famous "Forty-Eight" and "the Art of the Fugue" he explored all the fugal permutations of the major and minor keys. At the same time his music rose above technical brilliance to achieve, especially in his organ music, the two Passions, many of the church cantatas, and the B minor Mass, intense emotional and expressive power. The cantatas, from his Leipzig appointment (1723) onwards, were integrated into the services. They consisted usually of a chorus based on a Lutheran hymn tune, recitatives, several extended arias, and a concluding chorus usually a straightforward version of the hymn tune in which the congregation joined. There are some two hundred of these works and they contain a wealth of comparatively unknown and sometimes even unrecognised beauties. The St. John and the St. Matthew Passion extend these procedures to a grand scale, an Evangelist telling the new Testament story in vivid recitative, the chorus taking the part of the crowd, soloists pondering in arias on the meaning of the Gospel, and Jesus's words being sung by a bass. Anyone who has heard either of these works well performed cannot help but dismiss from his mind any idea of Bach as a mere dry-as-dust musical mathematician. In the St. Matthew Passion, every suggestion in the text that can possibly be illustrated by a musical equivalent is so illustrated. The Old Testament Pharasaic law is represented by strict musical forms such as the canon; Christ's sayings are given noble arioso life; and the arias reflect truly the New Testament's compassionate message. Technically the work is a marvel; expressively it is eloquent. The B minor Mass, although it contains borrowings from many of his own works, still stands as a satisfying monumental whole in which Bach's choral writing achieved a new richness, the adaptations being in accord with their new setting.

Bach's instrumental music, especially the violin concertos and the unaccompanied works for violin and cello, not only show the immense range of his powers but also contain many of his deeper thoughts, whereas the orchestral suites and the Brandenburg concertos are more extrovert, particularly the rhythmically exuberant fast movements.

Bach closes an era—that of the later contrapuntalists—by achieving the *ne plus ultra* in fugal composition; his last, incomplete work, the Art of the Fugue, is evidence of this.

Handel (1685–1759).

During his lifetime Handel was far more widely recognised as a great composer than Bach, and his music, unlike Bach's, maintained its place in popular esteem until the re-discovery of Bach and the dominance of the symphony placed Handel somewhat in the background.

During the latter part of the 19th cent. Handel's name was mainly associated with mammoth, anachronistic performances of a small sample of his oratorios at the Crystal Palace and elsewhere in England. In his lifetime these works, and all his other works in the genre, were sung by a small choir who were outnumbered by the instrumental players. Over the past few years authentic-sized performances of his oratorios and a revival of interest in his operas have revealed the real Handel, unknown to our grandparents.

The operas were neglected partly because the vocal prowess they required—and which the castrati so brilliantly supplied—was no longer available and because their dramatic life, at least according to 19th- and early 20th-cent. tenets, hardly existed. Now it is realised that this neglect has deprived us of an unending stream of glorious melody and of much daring harmony. But perhaps it is in the hitherto disregarded oratorios, such as *Semele*, that Handel's innate dramatic sense and musical range are to be heard gloriously fulfilled, and the pastoral serenade *Acis and Galatea* is surely one of the most delightful scores ever composed.

Handel was a colourful, imaginative orchestrator, and this can be heard both in his accompaniment to vocal music and in his concerti grossi, op. 3 and 6, the earlier set exploiting a diversity of interesting string and wind combination. In his writing he was at home in a polyphonic or homophonic style as his superb choruses show. His organ concertos, of which he was the "inventor" (to quote a contemporary source), were often played between the acts of his oratorios. They are alternately expressive and exuberant pieces calling for some virtuosity from the player. His occasional works, such as the Water Music and Fireworks Music show his ingenuity in extending the range of the typical 17th cent. suite to serve a particular occasion.

Handel's working life was mostly spent in England where his Italian operas were acclaimed. In the years between his arrival here in 1711 and 1729 he wrote nearly thirty operas. It was only when the public tired of these and his reputation slumped that he turned to oratorio with equal

Bach and Handel between them crowned the age of polyphony that had lasted for two hundred years or more. After them, it is hardly surprising that composers began looking for a new style, already anticipated in the music of Rameau and particularly Dominico Scarlatti (1685–1737), whose harpsichord sonatas foreshadowed the classical sonata form that was to dominate music for the next two hundred years. The change in musical style about 1750 was partly the result of a change in musical patronage. Bach was the last great composer to earn his living through being employed by the church. The new patrons were the nobility who liked to have a composer on hand to write for the various evening entertainments of the time. For this purpose the princes and dukes had their own orchestras and their own small opera houses. The music required had to be elegant, formal, *galant*. Haydn was exceptionally fortunate in having an employer, Prince Nicholas of Esterhazy, who allowed him to write more of less as he wished so that he was able to develop symphonic form into something more than a pleasing way of passing an evening.

The early symphonists, culminating in Haydn, broke away from Bach's contrapuntal treatment of the orchestra. Instruments now came to be treated in a more colourful manner according to their particular timbre. The court of Mannheim had an orchestra of a standard unheard hitherto, and Johann Stamitz (1717–57) and his son Karl (1745–1801) influenced the great composers who were to follow in their footsteps. The composition of their orchestra was flexible, oboes, flutes, and horns often being added to the standard string section. Bach's son Carl Philipp Emanuel (1714–88) added to and developed symphonic and sonata form, especially as regards keys and subjects.

Haydn and Mozart.

These two figures dominate the second half of the 18th cent. as Bach and Handel did the first. In a brief space only a general picture can be presented of their huge output and influence. Of Haydn's 104 symphonies (there may even be others) more than half are worthy of study and hearing. The craftsmanship is always remarkable, the invention ever new. Indeed without Haydn's harmonic daring or his melodic ingenuity, the even greater symphonic thought of Beethoven would have been impossible: Haydn laid the groundwork on which his successor built towering edifices. A work such as the 93rd symphony in D is typical of his mature style with its searching introduction, powerfully wrought, earnestly argued first movement, beautiful *Largo* and resourceful bustling finale. Haydn did not fight shy of contrapuntal writing: the development section of this symphony's first movement and the finale are evidence of that, but it was only as an integral part of a predominantly homophonic technique.

Mozart's symphonies are not so different in form from Haydn's but—and this must be a subjective judgment—he put more emotional feeling into his. Nobody could listen to the heart-searching first movement of his 40th symphony without being deeply moved. It was in his final three works in the medium that Mozart brought his symphonic art to perfection, and these obviously had an effect on Haydn's later symphonies written after them. For passion and tenderness contained within a classical form these late symphonies, and many other of Mozart's works, have yet to be surpassed.

Haydn, who has been rightly termed "the Father of the Symphony" was also the founder of the string quartet—perhaps the most perfect, because the most exactly balanced, form of musical expression. The four instruments—two violins, viola, and cello—discuss, argue, commune with each other over the whole gamut of feeling. In his quartets Haydn's mastery of structure is even more amazing than in his symphonies. Mozart's quartets (especially the six devoted to Haydn) and even more his quintets achieve miracles of beauty in sound, nowhere more so than in the first movement of the G minor (his most personal key) quintet. The two late piano quartets show how the piano *can* be ideally combined with strings. His clarinet quintet is also a masterly work.

Haydn did not leave any concertos of consequence. Mozart's, especially those for piano, are among his greatest works. As a brilliant clavier player himself, he showed a consummate skill in writing for the keyboard. Although the instrument he knew was slightly less advanced than the piano today, his concertos call for virtuosity in execution, yet they are as searching in emotional content as the late symphonies and quartets. Indeed the C major concerto (K. 467) and the C minor (K. 491) may be said to hold the quintessential Mozart. As well as twenty (mature) piano concertos, Mozart wrote six for the violin, four for the horn, and eighteen others, but none of these delightful as they are, can be placed in quite the same class.

Of their church music, Haydn's sixteen masses and his oratorios—*The Creation* and the *Seasons* (both late works)—are perhaps more worthy of attention than Mozart's various masses, but we must not forget Mozart's final work—the Requiem or the serene late Motet *Ave Verum Corpus*.

Eighteenth-century Opera.

Mozart—for many the first great opera composer—did not, of course, create his masterpieces out of nothing. In France, Lully was followed by Rameau (1683–1764), who carried on his tradition of using classical themes but developed a more flexible style of recitative and greatly increased vividness of expression. But it was Gluck (1714–87) who more than anyone broke out of the straitjacket of the now ossified Italian form of opera—dominated by the singer—and showed just what could be achieved in moving human terms. Drama in music really came of age with his *Orfeo e Eurydice* (1762), *Alceste* (1767) and *Iphigénie en Tauride* (1779). His simplicity and poignancy of expression were not lost on Mozart.

Meanwhile in Germany a kind of opera called *Singspiel* appeared during the 18th cent. Breaking away from classical themes, mundane stories were told in dialogue and music.

Until quite recently Haydn's operas were dismissed as unworthy representations of his genius but, chiefly through the enlightening efforts of the Haydn scholar, H. C. Robins Landon, some of his fifteen surviving works in the medium have been successfully revived. They have proved to be perfectly viable for the stage and, especially in the ensembles, full of that delightful invention to be found in the rest of his opus, if on a less fully developed scale. Still as musical drama they inevitably fall far short of Mozart's achievements, for the younger composer seems to have had an instinctive feeling for the stage. Into his operas he poured his most intense, personal music. He vividly portrays the foibles, desires, loves, and aspirations of mankind.

The earlier, immature stage pieces of his youth led to such works as *Lucio Silla* (1772) and *La Finta Giardiniera* (1775) with their first glimpses of the glories to come. His first indubitably great opera is *Idomeneo* (1781). Despite its unpromisingly static plot, *Idomeneo* reveals Mozart's stature through its ability to breathe new life into a conventional *opera seria* form. Though influenced by Gluck it is yet more human and touching in its musical expression. To succeed this Mozart wrote a much more frivolous piece *Die Entführung aus dem Serail*. Stemming from the *Singspiel* tradition, it none the less creates real-life characters who have much charming music to sing.

After three lesser pieces Mozart embarked on his four masterpieces—*Le Nozze di Figaro* (1786), *Don Giovanni* (1787), *Così fan tutte* (1790), and *Die Zauberflöte* (1791).

Figaro, as well as being a delightful comedy, explores more fully than any previous opera situation and character, which find expression in

beautiful arias and in two finales of symphonic proportion. In *Don Giovanni*, less satisfactory as a dramatic structure, the range of musical characterisation and insight into human motives is widened still further. *Così* lyrically but humorously expresses the follies of love. Mozart could not help but love his characters and his music for them is at one and the same time amusing and heartfelt. *Die Zauberflöte*—The Magic Flute—displays Mozart's deep-felt love of his fellow men and of truth in an opera of great spiritual strength. Nor has opera any more loveable personality than the birdcatcher Papageno. Mozart's final opera *La Clemenza di Tito*, extolling imperial magnanimity, has never achieved the success or popularity of his other maturer stage works, though it contains much excellent music.

Beethoven.

Mozart was the last major composer to depend, to any large extent, on private patronage for his living, and even he left the service of the Archbishop of Salzburg because he could not stand the restrictions imposed on his freedom. Henceforth composers would have to stand on their own two feet with all the advantages (liberty) and disadvantages (lack of security) that implied. Beethoven (1770–1827) was the first such composer of importance.

Although his work is usually divided into three periods, this division is somewhat too arbitrary, for no other composer in history, with the possible exception of Wagner, has shown such a continual development of his genius. Coming at just the right moment in musical history, he crowned the achievements of Haydn and Mozart with music of the utmost profundity of thought and feeling that looks back to its classical heritage and forward to the romantic movement of the 19th cent. His influence on musical thinking and writing is incalculable.

His first period shows his strong melodic gifts and the beginning of his individuality in developing form and structure to suit his own ends and match his particular genius. Unusual keys are explored, unusual harmonic procedures employed. With the "Eroica" (his third symphony) he established his position as a great composer. The unity of purpose he here achieved within a long and diverse structure is truly staggering, even today. In the first movement alone the structural invention and cogency went far beyond what even Mozart had achieved in his "Jupiter" symphony, and the second movement—a vast funeral March—has an overwhelmingly tragic emotional content. But the "Eroica" was followed by six equally great symphonies, each one as varied, as inventive, as unified as the others. The ninth symphony is significant in both its length and finale. Here Beethoven crowns three superb instrumental movements with a choral movement that, as well as summing up all that has gone before, expresses in music the joy in existence more ecstatically than any other work.

The burning intensity of Beethoven's genius is just as evident in his chamber music. His quartets are the product of a revolutionary age in which the social graces and formal restraint of the 18th cent. were thrown off in a search for a more personal mode of expression. The early op. 18 set, and the Razoumovsky quartets, op. 59, go even beyond the range of Haydn's and Mozart's works in the medium but it was in his late quartets, his final musical testament, that Beethoven refined and distilled his art for posterity. No words can possibly describe their unique quality, but any and every chance should be taken to make their acquaintance: the effort required will be more than amply rewarded.

The early piano concertos do not reach quite this level of attainment, but the last three, together with the violin concerto, are on a par with the finest of the symphonies and quartets, as well as being considerable tests of the performers' technique. The Triple Concerto for piano, violin, and cello is an unusual and rewarding work.

Beethoven's grandest choral work—and one of the most noble in existence—is the Mass in D (*Missa Solemnis*). Its vast scale and sublime utterance often defeat performers, but when it is successfully done there is no more spiritually uplifting experience for the listener. Except perhaps Beethoven's only opera, *Fidelio*. This simple escape story was transformed by Beethoven's creative fire into a universal symbol of liberty, the composer identifying himself with the struggle for freedom from tyranny and release from darkness.

Beethoven lived in a period of war and revolution. A passionate belief in the brotherhood of man and in liberty, he was shocked to find his ideals thrown over by revolutionaries-turned-dictators. His own tragedy of deafness, which came upon him at the moment of his triumph, nearly submerged him, but in the end he won through and produced the string of masterpieces from the "Eroica" onwards. Hope springing from despair, love from hatred, victory over defeat, these are the unquenchable legacies left by Beethoven.

The Romantic Movement.

Inevitably, the Romantic movement in literature that burst forth about 1800 was bound to have its counterpart in music. And so it was. Breaking the classical bonds, composers such as Schubert, Schumann, Liszt, and Berlioz sought a new freedom in musical expression. Form became of less importance than content; and that content often had literary connections. For their purposes a larger orchestra was needed and supplied, but the miniature, the song especially, because of its very personal connotation, was also a favourite form.

Schubert (1797–1828)—described by Liszt as "the most poetic of musicians"—is perhaps the greatest lyrical genius in musical history. In him the Viennese tradition and influence of Haydn, Mozart, and Beethoven reached its zenith. The song was always Schubert's starting point, so it is hardly surprising that his reputation as a song writer has never been impaired but in his symphonic and instrumental works too it is always his inexhaustible fund of melody that first calls for attention. Nobody could listen to his "Trout" quintet, for piano and strings, his octet, his fifth symphony, or his song cycle *Die Schöne Müllerin* without being enchanted and invigorated by the sheer tunefulness of the music. But there is much more to Schubert than this: his understanding of the possibilities of harmonic change, his grasp of orchestral coloration (in the great C major symphony, for instance), his free use of sonata structure.

Although Mozart, Haydn, and Beethoven had all contributed to the song as an art form, it was with Schubert that it achieved its first full flowering. If he had written nothing but his songs, his place in the musical firmament would be assured. With his *Erlkönig* in 1815 the German *Lied* came of age and from then until the end of his life he wrote more than six hundred songs, hardly a dud among them. Whether it is the charm of *Heidenröslein*, the drama of *Der Doppelgänger* or the numbed intensity of the *Winterreise* cycle Schubert unerringly went to the heart of a poet's meaning; indeed he often raised poor verses to an inspired level by his settings. And for the first time the pianist shares a place of equal importance with the singer.

There is only room to mention one or two other composers, some of them wrongly neglected, who were roughly contemporaries of Beethoven and Schubert: the Czech Dussek (1760–1812), who like Beethoven bridges the classical–romantic gulf, Boccherini (1743–1805), the two Italian opera composers Cimarosa (1749–1801) and Paisiello (1740–1816), the Frenchman Méhul (1763–1817) and the German Hummel (1778–1836).

Weber (1784–1826) lacked Beethoven's energy and constructive powers and Schubert's sheer lyrical profundity, but he is an important figure, especially in the field of opera, where his *Der*

Freischütz and *Oberon* led the way to a more flexible, dramatically realistic form of opera. His vivid imagination exactly fitted the new romantic mood abroad. The sheer beauty in the melodic shape of his music is also not to be denied.

Mendelssohn and Schumann.

Mendelssohn (1809–47) was the civilised craftsman among the Romantic composers. A boy genius—many of his finest works were written before he was twenty—he maintained the importance of classical form while imbuing it with his own affectionate brand of poetic sensibility. His third and fourth symphonies—the "Scottish" and "The Italian"—(and possibly the fifth "The Reformation"), his string quartets (some of which go deeper than most of his music), violin concerto, first piano concerto, and of course, the incidental music to "A Midsummer Night's Dream" represent his tidy yet effervescent style at its most winning.

Schumann (1810–1856) is less easy to categorise. His early romantic flame was burnt out by some flaw in his intellectual and/or emotional make-up, and his inspiration seems to have declined in later years. No matter, by then he had given us the marvellous song cycles of 1840, an ever fresh piano concerto, many fine piano solos, including the mercurial, popular *Carnaval* and several symphonies, which, if not structurally perfect, contain much lovely music. The joys and sorrows of love and the feeling for natural beauty are all perfectly mirrored in these charming, lyrical works.

Romantic Giants.

Berlioz (1803–69) and Liszt (1811–86) are the two most typical representative figures of the Romantic era. Both have always been controversial figures, with ardent advocates and opponents either unduly enthusiastic or unfairly derogatory. Berlioz might be termed the perfect painter in music. With an uncanny mastery of orchestral sound he could conjure up the countryside, the supernatural and the historical with the utmost ease. He based his music on the "direct reaction to feeling" and a desire to illustrate literature by musical means. That his technical expertise was not always the equal of his undoubted genius, can be heard in many of his larger works such as the dramatic cantata *The Damnation of Faust* and the dramatic symphony *Romeo and Juliet*, yet most people are willing to overlook the occasional vulgarity for the ineffable beauty of his many fine pages, but brutal cuts in his music, such as are often made in, for instance, his epic opera *The Trojans* only have the effect of reducing the stature of his works. We must accept him, warts and all. Anyone who has seen the two parts of *The Trojans*, presented complete in one evening at Covent Garden, will realise that Berlioz knew what he was about.

His output is not quantitatively large but includes several monumental works, as well as *The Trojans*. The *Requiem* ("Grand Messe des Morts") requires a tenor solo, huge chorus and orchestra, and brass bands, although Berlioz uses these forces fastidiously. The *Symphonie funèbre et Triomphale*, calls in its original form, for choir, brass, and strings. But Berlioz was just as happy writing on a smaller scale as his exquisite song cycle, to words of Théophile Gautier, *Nuits d'Été*, shows. Gautier perhaps summed up better than anyone Berlioz's singular talent: "In that renaissance of the 1830s Berlioz represents the romantic musical idea, the breaking up of old moulds, the substitution of new forms for unvaried square rhythms, a complex and competent richness of orchestration, truth of local colour, unexpected effects in sound, tumultuous and Shakespearian depth of passion, amorous or melancholy dreaminess, longings and questionings of the soul, infinite and mysterious sentiments not to be rendered in words, and that something more than all which escapes language but may be divined in music."

During his lifetime Liszt was fêted and honoured not only by his musical colleagues but by the world at large, which idolised him and his piano. Then his reputation took a plunge from which it has only recently recovered. To be sure much of his early music is glitter and gloss, but his symphonies and tone poems—especially the Faust Symphony, the Dante Symphony (both, of course, inspired by literature), and *Orpheus* and *Prometheus*—and his late piano works show that he was an extraordinary harmonic innovator. The piano sonata in B minor brings his romantic, wilful temperament within a reasonably stable, pianistic form, and as such is a landmark in the repertory of the instrument. Liszt's output was prodigious, but the inquiring listener should explore the more original of his compositions already mentioned to form a true picture of his fertile genius.

Chopin.

Chopin (1810–49) was the master of the keyboard, par excellence. His development of the technical and expressive capabilities of the piano is unique in musical history. His inventive powers were poured out with nervous passionate energy and in a highly individual style through twenty astonishing, possibly agonised years of creative activity before his early death. A Chopin melody, limpid, transparent, singing, can be recognised easily by anyone, but his style gradually developed into something more subtle, more satisfying than pure melody. He took the greatest care of every detail so that any alteration, however small, upsets the perfect balance of his work. His poetic sensibility can be found in any of his works; for his constructive ability we must turn to the Ballades, the B minor Sonata, and the Barcarolle, while the Preludes and Studies blend technical powers and emotional expressiveness in ideal proportions.

Nineteenth-century Opera.

After Mozart's operas and Beethoven's *Fidelio*, the medium might have been expected to decline. Instead it took on a new, if different, lease of life that culminated in Verdi's extraordinary output.

Rossini (1792–1868) created a world of exuberant high spirits in his operatic works that are as cheerful and heart-warming today as they were a hundred or more years ago.

He always worked in and around the lyric theatres of Italy and between 1810 and 1830 poured out a stream of works, not all of which can be expected to be masterpieces. However, *Il Barbiere di Siviglia*, *L'Italiana in Algieri*, *La Cenerentola* and *Le Comte Ory* will always delight audiences as long as opera houses exist. Although these works are difficult to sing really well, their vitality and charm can never be submerged even by poor voices or indifferent staging.

His German contemporaries were critical of his confidence and frivolity, but his works show a consistency of invention and an irresistible tunefulness that anyone might envy. In recent years, there has also been a renewed interest in his more serious operas—*Otello* (1816), *La Gazza Ladra* (1817), *Semiramide* (1823), *La Siège de Corinthe* (1820), and *Guillaume Tell* (1829)—which were certainly surpassed in dramatic power by his successors but which nevertheless are not to be despised or neglected.

William Tell, to give it its more popular title, was his last work for the stage although he lived on for nearly forty years in retirement in Paris, scene of many of his greatest successes. There he enjoyed good living, dispensing *bons mots*, and occasionally composing trifles. An exception is the unpretentious *Petite Messe Solennelle*, written originally for soloists, chorus, a harmonium, and two pianos. Rossini later orchestrated it, but he would not allow it to be performed during his lifetime. The first public performance was on 28 February 1869, as near as possible to the 78th anniversary of the composer's birth on Leap Year Day 1792.

In contrast to the mercurial Rossini, Vincenzo Bellini (1801–1835) was an exquisite, romantic figure dealing with exquisite, romantic stories, an operatic equivalent to Chopin, who much admired him. His delicate, sinuous vocal line (in the arias) and brilliant acrobatics in the final sections (cabalettas) require singers of the utmost accomplishment to do them justice, although his music is never as florid as Rossini's. His most typical and popular works are probably *La Sonnambula* (1831), *Norma* (1831) and *I Puritani* (1835). The first is a tender, homely country story, the second an almost heroic lyrical drama of sacrifice, and the third a rather unsatisfactory historical story redeemed by its appealing music. In the past few years singers of the calibre of Maria Callas, Joan Sutherland, Guiletta Simionato, and Marilyn Horne have brought Bellini's operas a popularity almost equal to that they enjoyed at the time they were written.

Gaetano Donizetti (1797–1848) was an even more prolific operatic composer than Rossini. He wrote at least 75 works, mostly for the Italian stage, several of which, such as *Alfredo il Grande* or *Emilia di Liverpool*, are never likely to be revived, but during the past few years, with the renewed interest in what are called the *Ottocento* operas, many of his serious operas have been resuscitated and found as enjoyable in performance as his more frequently heard comedies.

He was a well-grounded musician and although his invention is often criticised for being too tied to the conventions of his day performances often belie this reputation, his dramatic instinct proving sure. *Lucia di Lammermoor*, because of the chances it offers to a coloratura soprano with tragic pretensions, has always held the stage and of late *Lucrezia Borgia*, *Anna Bolena*, *La Favorita*, and *Poliuto* have all been successfully revived. Of his lighter works, the comedies *L'Elisir d'Amore* and *Don Pasquale* have never declined in popularity. One of his last works was *Linda di Chamounix* (1842) which he wrote for Vienna where it aroused such enthusiasm that the Emperor appointed him Court Composer and Master of the Imperial Chapel.

French Opera.

The taste in Paris was for more and more lavish productions. Following Spontini (1774–1851), whose works were comparatively austere, came Halévy (1799–1862) and Giacomo Meyerbeer (1791–1864) whose operas contain all the ingredients that came to be expected of "Grand Opera"—spectacle, huge ensembles, showpieces for the soloists, and extended, if superfluous ballet. Drawing from Italian, German, and French traditions Meyerbeer's music contained everything the public wanted, yet today they are seldom revived, perhaps because his creative powers were essentially derivative, yet when they *are* given, operas like *Les Huguenots*, *Le Prophète*, and *L'Africaine* still have the power to fascinate and his influence on his successors, notably Wagner, was considerable.

Verdi.

Italian opera in the 19th cent. culminated in the works of Giuseppe Verdi (1813–1901), who rose from a peasant background to become his country's most noted composer, as well as something of a natural hero during the period of the Risorgimento. His earliest works, indeed, often roused his hearers to patriotic fervour. For instance, *Nabucco* (1842), with its theme of an oppressed people seeking deliverance, was treated as a symbol of the Italians' fight for freedom.

Musically, Verdi developed out of all recognition during the course of his long career. The continuously flowing structure of his last two operas *Otello* and *Falstaff* is very far removed from the start–stop formulas, inherited from his predecessors, of his first works, yet even they are touched, in harmonic subtleties, orchestral felicities, and a sense of drama, by a spark of genius, a burning inspiration that sets him apart from all other operatic composers. *Ernani* (1844), *I due Foscari* (1844), and *Luisa Miller* (1849) all have foretastes of glories to come even if as a whole they are flawed dramas, and these "galley years", as Verdi himself later described them, gave him the essential know-how to produce his later, greater operas, as well as establishing him incontrovertibly as the most popular Italian composer of the time.

However, it was with *Rigoletto* (1851), *Il Trovatore* (1853), and *La Traviata* (1853) that Verdi first really staked his claim to immortality. In these pieces his increasing dramatic mastery are married to a wonderful flow of lyrical melody, at the same time controlled by a fine musical sensibility. They were followed by four operas—*Simon Boccanegra* (1857), *Un Ballo in Maschera* (1858), *La Forza del Destino* (1862), and *Macbeth* (revised version, 1865)—in which Verdi overcame complexities of story line by his continually developing musical powers. This period is crowned by *Don Carlos* (written for the Paris Opéra, 1867) a masterly exercise in combining private and public situations in a single, grand, and characterful work. In some respects Verdi never surpassed the subtlety of his writing in this opera. *Aida* (1871) carried on the process but the characterisation in this ever-popular piece is less refined than in *Don Carlos*, if the grandeur of the design is more spectacular.

The success of *Otello* (1877) owes nearly as much to the skill of Boito whose literary ability combined with musical knowledge (he was himself a composer) presented Verdi with an ideal libretto for his seamless music in which the drama moves inevitably to its tragic end. Recitative, aria, ensemble are fused in a single, swiftly moving music-drama, which in its very different way equals that of Wagner. *Falstaff* (1893) achieves the same success in the field of comic opera, a brilliant, mercurial ending to a distinguished career. If Verdi had written only these two final masterpieces his place in musical history would be assured.

Brahms.

Brahms (1833–1897) has justly been described as "a romantic spirit controlled by a classical intellect," for while complying with most of the formal regulations of sonata form he imbued them with an emotional content that accorded with his time. Indeed Schumann declared that he was the "one man who would be singled out to make articulate in an ideal way the highest expression of our time."

Perhaps in his chamber music will be found the quintessence of his art. The piano and clarinet quintets, the two string sextets, the horn trio, and the violin sonatas all are designed on a large scale yet the expression remains intimate, the design and structure clear.

The symphonies and concertos, though, remain his most popular works; they are part of the solid repertory of every orchestra and most piano and violin players in the world. Their high seriousness, constant lyrical beauty, and control of form are deeply satisfying. They do not provide the extremes of passion and excitement provided by his contemporaries, but their study provides continuous absorption and delight. The double concerto for violin and cello deserves a mention as a unique work in music.

Brahms wrote more than two hundred songs in which the desire for melodic beauty takes precedence over the words and meaning. Many are set to poor poetry, but hidden away are still some unexplored treasures, and the Four Serious Songs, at least, are tragic masterpieces. In a lighter vein the two sets of *Liebeslieder Walzer* for four voices are irresistible. The choral Requiem, too, is a fine work.

Bruckner.

In recent years Bruckner's reputation *vis-à-vis* his great contemporary Brahms has been enhanced in England. The old conception of him

as a naïve Austrian unable to grasp the fundamentals of symphonic architecture has died hard, and the prevailing popularity of his grandest works is at last gaining him his rightful place in the 19th-cent. firmament. The nine symphonies and the masses are his chief claim to immortality. They contain melodies of unforgettable beauty, symphonic paragraphs of unparalleled grandeur, and an appreciation of formal development that, though different, is as equally valid as that of Brahms. The movements of his symphonies are long and he often pauses, as if for breath and to admire the scenery, before he reaches the climactic peak of his musical journey. His idiom is best approached by a newcomer to his work through the fourth and seventh symphonies as they are perhaps the easiest to understand, but the fifth, sixth, eighth, and ninth (unfinished) are just as beautiful—and cogently argued—once one has acquired the knack, so to speak, of listening to his music. Most of these works are now to be heard in their original form, stripped of the veneer of "improvements" suggested to the diffident composer by his friends.

As well as the masses, which translate Bruckner's symphonic ideas to the choral plain, Bruckner's delightful string quintet is worth investigating.

Wagner.

Praised only this side of idolatry by his admirers, unmercifully criticised by his detractors, Richard Wagner (1813–83) is perhaps the most controversial composer in musical history. And so it was bound to be with such a revolutionary figure, whose writings, other than his music, contain, to say the least, dubious theories and whose operas, composed to his own libretti, broke the bonds of the form as known until his time. He regarded music-drama as a fusion of all the arts—music, literature, painting—in one unity. With *The Ring of the Nibelungs* he achieved his purpose; no other work of art has ever tried to encompass the whole of existence. Today, and surely forever, musicians, philosophers, and writers will argue over its meaning, and each age will reinterpret it according to its own lights.

But before he reached this pinnacle of achievement, Wagner gradually transformed opera—through *Rienzi*, *The Flying Dutchman*, *Tannhäuser*, and *Lohengrin*—so that a new mould was fashioned to take what he wanted to pour into it. He introduced the *Leitmotiv*, a musical theme that could be associated with a particular person, situation, or idea, each time it occurred. Slowly he developed the musical form so that the drama could unfold continuously without breaks for arias. By the time he began to write *Tristan and Isolde* and *Die Meistersinger*, he had perfected his methods and had he never undertaken *The Ring* that tragedy and that comedy would have assured him his place in the musical firmament. Indeed, *Die Meistersinger* is considered a masterpiece even by those who are not willing or prepared to accept the rest of the Wagnerian ethos.

The length and complexity of these operas, and of *Parsifal*, a work of unique beauty in spite of certain *longueurs*, means that it is almost essential to prepare oneself by homework, with libretti and records, before attempting to assimilate them in the opera house. The added effort is well worth while for the ultimate musical satisfaction they bring because Wagner was more than an operatic reformer: he opened up a new harmonic language (especially in the use of chromaticism) that was logically to develop into the atonality of the 20th cent.

Wolf.

As Wagner was the culmination of the 19th cent. symphonic and operatic tradition, so Hugo Wolf (1860–1903) summed up, if he did not surpass, the achievements in song-writing of Schubert Schumann, and Loewe (1796–1869).

Wolf was a lonely pathetic man. He lived much of his life in poverty, and eventually lost his reason and died of an incurable disease. These circumstances account perhaps for his almost feverish bursts of creative activity, which were also the outward sign of his burning genius. His greatest contributions to the art of *Lieder* were his extraordinary insight into the poet's meaning and the harmonic means by which he heightened the expression of the words. He raised the importance of the piano part even higher than had Schumann, and in some of his songs the vocal part takes the form of a free declamation over a repeated idea in the piano. However, in the main the vocal and piano parts are interweaved with great subtlety, and he unerringly matched the very varied moods of the poems he chose to set. His greatest creative period was between early 1888 and early 1890 when songs poured from his pen daily—more than 50 settings of the German poet Mörike, 20 of Eichendorff, more than 50 of Goethe, and more than 40 of Heyse and Geibel (the Spanish Song-book). Later he composed songs from Heyse's Italian Song-book and the three Michelangelo sonnets. And the range of his creative understanding was wide, taking in the almost wild passion of the Spanish songs, the humanity and humour of the Italian love-songs, the titanic power of *Prometheus* (Goethe), the varying moods of the Mörike book, and the intangible power of the Michelangelo sonnets. There are almost inexhaustible riches here for the inquiring mind to discover. Outside Lieder, Wolf's output is small, but it includes a sadly neglected opera, *Der Corregidor*, the Italian Serenade for string quartet (alternatively for small orchestra) and a tone poem *Penthesilea*.

Ernest Newman, his greatest champion, summed up his work most aptly: "Wolf practically never repeats himself in the songs; every character is drawn from the living model. It is a positively Shakespearian imagination that is at work—Protean in its creativeness, inexhaustibly fecund and always functioning from the inside of the character or the scene, not merely making an inventory from the outside."

National Movements.

During the course of the 19th cent., alongside the emergence of national political identity, came the rise of nationalism in music, fertilising traditional Western—that is basically German—musical forms with folk material. Of these groups the Russian is certainly the most important, if not the most vital.

Glinka (1804–57) was the first important Russian composer of the national school and, although his two operas *A Life for the Tsar* (sometimes called *Ivan Susanin*) and *Russlan and Ludmilla* are strongly influenced by Italian models, they do introduce Russian song and harmony into the texture. He undoubtedly influenced Borodin (1833–87), Cui (1835–1918), Balakireff (1837–1910), Mussorgsky (1839–81) and Rimsky-Korsakov (1844–1908)—the so-called "Five" of 19th-cent. Russian music. However, each was very much of an individualist too. Borodin was a lecturer in chemistry who wrote in his spare time. His two symphonies, two string quartets led up to his most notable work, the opera *Prince Igor*, left incomplete at his death. Balakireff, friend and adviser to the rest of the group, wrote little himself, but his orchestral works and the piano fantasia, *Islamey*, are worthy of investigation.

Modest Mussorgsky (1839–81) is today seen as the most important and inspired of "The Five." More than the others he used Russian song and Russian speech as the basis of his operas in which he portrayed the lives and destinies of his own people. Although his capacities were seriously impaired by an uncongenial job, poverty, and drinking, he produced two great operas, *Boris Godunov* and *Khovanshchina*, and another *Sorochinsy Fair* that is immensely enjoyable. *Boris* should be given in its original, with spare orchestration, but more often than not it is heard in Rimsky-Korsakov's more elaborate revision. In any case the opera exists in various versions, none of them necessarily the right one: what is im-

portant is to hear it in one or the other because of its great portrayal of Boris's personality set against the background of the Russian people, unforgettably presented in choral outbursts. *Khovanshchina* was completed by Rimsky-Korsakov, *Sorochintsy Fair* by Tcherepnin (although other versions also exist). Mussorgsky's songs explore a new vein of naturalistic vocal declamation. Each of the four *Songs and Dances of Death* is a miniature drama worthy of Wolf, although of course in a quite other idiom. The *Nursery* songs miraculously conjure up a child's world as seen from a child's point of view. Many of the individual songs, the *Sunless* cycle too, should be investigated.

Rimsky-Korsakov (1844–1908) is perhaps a less attractive figure because so much of his music seems heartless or merely decorative, but this judgment is probably made on the strength of hearing *Shéhérazade* and the *Capriccio Espagnol* a few too many times. Such of his 15 operas that are played evince a (literally) fantastic mind and lyrical vein, and it is a pity that *Sadko*, *The Snow Maiden*, and *The Tsar's Bride*, at least, are not heard more often.

Tchaikovsky.

Peter Ilyich Tchaikovsky (1840–93) is a more universally admired figure than any of "The Five" and his music is indubitably closer to the mainstream than theirs in that it adheres more nearly to Western European forms. His popularity is due to his unhesitating appeal to the emotions and to his tender, often pathetic melodic expression. His lyrical gift is stronger than his sense of architecture, as he himself admitted. Yet his later symphonies—the fourth, fifth, and sixth (the *Pathétique*)—are all cogently enough argued and invigorating, as can be heard in the hands of a conductor willing to emphasise their formal power rather than their tendency towards sentimentality: the orchestral craftsmanship is also superb. The three piano concertos and the violin concerto offer rare opportunities for virtuoso display within a reasonably dramatic structure and his various overtures are always exciting to hear.

The three ballets—*The Sleeping Beauty*, *Swan Lake*, and *Nutcracker* show Tchaikovsky's skill on a smaller and perhaps more congenial scale, but only two of his operas—*Eugene Onegin* and *The Queen of Spades*—survive in regular performance. They demonstrate his ability to delineate character and his always eloquent melodic invention. His songs often felicitously capture a passing mood or emotion.

Bohemia (Czechoslovakia).

The Czech national school is dominated by two composers—Smetana (1824–84) and Dvořák (1841–1904). In his own country Smetana holds a unique position as the father of his country's music—which is remarkable when you consider that he lived in a country that was then under Austrian rule and never spoke the Czech language perfectly. Yet his music is filled with the spirit of Czech history and national life, and many of his operas, his most important contribution, deal purely with national subjects. The reawakening of interest in things national, after Austria's defeat by Italy in 1859, led to the establishment of a Provisional Theatre in 1862 and Smetana's first opera *The Brandenburgers in Bohemia* was produced there in 1866, but its success was eclipsed by the enormous popularity of *The Bartered Bride*, which appeared the same year. Its melodic charm, lively characterisation and cosy humour have carried it round the world and it is the one Smetana opera to be in the repertory of most opera houses. However, his next opera *Dalibor* (1868) is considered by some authorities as his masterpiece. It is conceived on a heroic scale, and frequently rises to great dramatic heights. His later operas include *Libuše* (1872) a solemn festival tableau, *The Two Widows* (1874), a delightful comedy, *The Kiss* (1876), *The Secret* (1878), and *The Devil's Wall* (1882).

His main orchestral work *Má Vlast* (My Country), written between 1874 and 1879, is a cycle of six symphonic poems nobly depicting the life and legends of his country. He wrote only three mature chamber works—an elegiac piano trio, written in 1855 in memory of the death of his eldest daughter, and two string quartets, both autobiographical. The first in E minor (1876)—"From My Life"—tells of his youth and aspirations until a terrible, screeching E in *altissimo* describes the onset of deafness; the second in D minor, sadly neglected, was described by the composer as an attempt to explain the "whirlwind of music in the head of one, who has lost his hearing," and was probably influenced by Beethoven's later music.

Dvořák combined a fecund melodic gift with an intelligent grasp of structure. His symphonies and chamber music are mostly written in classical form, yet the works are imbued with a spontaneity and freshness that have not lost one whit of their charm over the years.

He wrote nine symphonies and, although only the last three or four are regularly performed, they are mostly mature works, several of which, for instance No. 7 in D minor (formerly known as No. 2) reach a tragic grandeur at times. They are all orchestrated in a masterly way and are full of delightful detail. Dvořák wanted to show that a Brahms could come out of Bohemia—and he succeeded in doing so while maintaining a definitely individual flavour, strongly influenced by natural rhythms.

He wrote three concertos, one each for piano, violin, and cello. The earlier ones are interesting without being quite in the first flight of the composer's output, but the cello concerto of 1895 is perhaps the composer's crowning achievement—warm, mellifluous, romantic.

He wrote chamber music throughout his long creative life. Some of the early works are weak and derivative, but the later string quartets, the "Dumky" trio, and the piano quartet and quintet are expressive and full of unforced invention. Dvořák felt himself somewhat hampered when setting words, nevertheless his *Stabat Mater* and *Te Deum* are both deeply felt choral works and he wrote songs throughout his career, many of them very fine indeed. He wrote ten operas, but only *Rusalka* (1901) has gained a foothold outside Czechoslavakia.

Janáček.

The Moravian composer Leoš Janáček (1858–1928) spent most of his life in Brno as a working musician. His music has recently come to be recognised as some of the most original written in the past hundred years. His operas, in which he closely followed the inflection of the speech of his native land, are his finest works. Over the score of his last opera, *From the House of the Dead*, he wrote the words "In every human being there is a divine spark" and it is this deep love of humanity that permeates all his works. Of his operas *Kátya Kabanová* (1921) and *The Cunning Little Vixen* (1924), the *Makropoulos Affair* (1926), and *From the House of the Dead* (adapted from a Dostoyevsky novel, 1928) are the most important and they have all been produced in Britain in recent years. His original genius is self-evident in all of them.

Among his orchestral works *Taras Bulba* and *Sinfonietta* should be noted, and his two string quartets, very difficult to play, should be better known. The song cycle, *Diary of one who has disappeared*, for tenor, contralto, and three female voices with piano, and the Glagolithic Mass contain music of much expressive beauty.

Hungary.

The Hungarian musical outburst came somewhat later than that in other countries. Its great figure is Bela Bartók (1881–1945) who, as well as being a national figure, has proved an influential composer in the whole of 20th-cent. music. His

mind was full of folk music, but it was transmuted by his strongly personal style and powerful intellect into something highly original. His music is tense and volatile but this restlessness is sometimes relieved by a kind of other-wordly, ethereal lyricism, as in the lovely slow movements of his quartets.

Bartók was affected as much by the musical innovations of Debussy and Stravinsky (see below) as by East European, notably Magyar, folk music and many of his works are an attempt to meld the two.

The most important part of his output is undoubtedly his string quartets which cover most of his creative life. To this intimate form he confided his personal innermost thoughts and in it conducted his most far-reaching musical experiments, thereby extending its boundaries beyond anything previously known. As with Beethoven's late quartets many of Bartok's rely on organic or cyclic development while remaining just within the laws of classical form. As Mosco Carner puts it, "For profundity of thought, imaginative power, logic of structure, diversity of formal details, and enlargement of the technical scope, they stand unrivalled in the field of modern chamber music."

The most important of his orchestral works are the three piano concertos, of which the first two are harsh and uncompromising, and fiendishly difficult to play, while the third, written in 1945, is mellower and more diatonic. The second violin concerto (1937–8) shows the various elements of Bartók's style in full flower, by turns exhuberant, passionate, and brilliant. The *Music for Strings, Percussion and Celesta* (1937) is remarkable for its strange sonorities and its fascinating texture. The *Concerto for Orchestra* (1944) is more immediately appealing and again shows the composer in complete command of a large canvas. Of the piano works *Mikrokosmos* (1935) and the sonata for two pianos and percussion (1937) are especially to be noted.

His chief stage pieces are *The Miraculous Mandarin* (1919), a harsh, cruel ballet which drew appropriately dramatic music from the composer, and the opera *Duke Bluebeard's Castle* (1911), a luscious, original score that makes one regret that he wrote no more operas later in his career.

Kodály (1882–1967) was from early years closely associated with Bartók and with him collected Hungarian folk melodies using many of them in his music. He worked in many forms and the more important of his works are the Peacock Variations for orchestra, the choral *Psalmus Hungaricus* and *Te Deum*, The *Dances of Galánta*, and the opera *Háry János*, and the sonatas for cello and for unaccompanied cello.

Sibelius, Nielsen and Grieg.

Among Scandinavian composers the Finn Jean Sibelius (1865–1957) and the Dane Carl Nielsen (1865–1931) are outstanding. Sibelius is a lone northern figure ploughing his own furrow, oblivious or, at any rate, ignoring the unusual developments that were taking place in Central Europe, yet his seven symphonies are strong as granite, honest, rugged works that will undoubtedly stand the test of time. They are not by any means all similar in mood, or even form. The first is very much influenced by Tchaikovsky and Borodin, the second and third show a more personal style developing, the fourth is terse and tragic, the fifth lyrical, bright, and lucid; the sixth is perhaps most typically Sibelian in its evocation of primeval nature, and the seventh—in one continuous movement—is a more purely abstract piece, notable for its structural logic and the grandness of its themes. The violin concerto is the most easily understood of the composer's main works and has a grateful part for the soloist.

The tone poems *The Swan of Tuonela*, *Pohjola's Daughter*, *En Saga*, *Night Ride and Sunrise*, *The Bard*, and *Tapiola* uncannily evoke the icy words of the legends of the far north, and the primeval forces of nature. Sibelius's one string quartet *Voces Intimae* and many of his songs are worth hearing too. The quality of this enigmatic composer's music has recently been the subject of much argument, but his musical personality is probably strong enough to survive the quirks of fashion.

Carl Nielsen (1865–1931) is another individualist. His six symphonies, like Sibelius's seven, are the most important part of his output, but whereas Sibelius was dealing with a huge, uninhabited northern landscape, Nielsen is more friendly and serene in his music, which is seldom forbidding, always inventive, throwing a new light, through unusual ideas about harmony, structure and tonality, on traditional forms. He also wrote highly individual concertos for the flute and clarinet, four string quartets and two operas—the dramatic, rather Brahmsian *Saul and David* (1902) and a delightful comedy, *Maskarade* (1906), full of lyrical music.

The Norwegian composer Edvard Grieg (1843–1907) was essentially a miniaturist whose range of feeling was not wide but whose music is always gentle and appealing. His most notable works are the romantic piano concerto, the atmospheric incidental music to Ibsen's play *Peer Gynt*, the charming Lyric Suite, and the small piano pieces. Not an important composer, then, but always an attractive one.

Elgar and the English Revival.

After the death of Purcell there is hardly a name in English music worth speaking of until the 19th cent. when Hubert Parry (1848–1918) and Charles Villiers Stanford (1852–1924), actually an Irishman, led a revival. Their music is seldom heard today, but their pioneer work paved the way for Edward Elgar (1857–1934). Although all were influenced by Brahms they nevertheless managed to establish a new English tradition that has been carried on in our own day. Elgar's symphonies are laid out on a grand, leisurely scale and they are both eloquent and exhilarating. His violin concerto has an elegiac slow movement as has the glorious cello concerto and both contain many fine opportunities for the soloist. The cello concerto is as appealing a work as any by Elgar expressing his innermost thoughts. His *Enigma* variations are a series of portraits in sound of his friends, but there is another overall theme to go with them that has never been identified. This has not prevented the work from becoming Elgar's most popular, not surprisingly when one considers its charm and melodiousness. Three other orchestral pieces that should not be neglected are his symphonic study *Falstaff*, a many-sided musical picture of the Fat Knight, and the overtures *Cockaigne*, a happy evocation of London, and *In the South*, inspired by a visit to Italy. His three late chamber works, written when he was 61, are reticent, economic pieces that remove any misconception of Elgar as a bombastic composer. His songs are mostly feeble, but the oratorios, notably *The Dream of Gerontius*, show the composer's ability to control a large canvas. The composer himself wrote over the score of *Gerontius*, "This is the best of me"—a verdict with which we can readily agree.

The French Impressionists.

César Franck (1822–90) was the main figure in mid-19th-cent. musical France and his influence spread even wider than his music of which only the D minor Symphony, the Symphonic Variations for piano and orchestra, the piano quintet, and the violin sonata are likely to be encountered today. The leading French opera composers of that time were Massenet (1842–1912) and Gounod (1818–93).

Concurrently with similar movements in French painting and poetry came the French Impressionist composers at the end of the 19th cent. Their leader—and one of the great seminal forces of modern music—was Claude Debussy (1862–1918). His aim was to capture a mood or sensation and he did that by more or less inventing a fresh system

of harmony using a whole-tone scale, unusual chords, and creating in the orchestra new, highly personal textures—there is no mistaking the Debussy idiom once you have heard at least one piece by him. His impressionistic style did not lead him, however, to abandon form as some have suggested, and his main works are just as closely organised as those by classical German composers. His music is sensuous and poetic yet nearly always formally satisfying as well.

His reputation, at least with the general musical public, rests largely on his orchestral music, a few piano pieces and his only opera *Pelléas et Mélisande*. *La Mer* is a scintillating evocation of the sea in all its moods; *Nocturnes*, *Images*, and *Prélude à l'Après midi d'un Faune* exactly suggest different places, times, moods—the "Iberia" and "Gigues" sections of *Images*, calling to mind respectively the spirit of Spain and the flickering light of a rainy English night. *Pelléas*, based on a Symbolist drama by Maeterlinck, tells a story of love, jealousy, and murder in predominantly restrained yet emotionally loaded terms. It is an elusive original work that has no predecessor or successor. Intensely atmospheric, rivetingly beautiful, it weaves an irresistible spell over the listener.

Debussy's chamber music is unjustly neglected. His string quartet (1893) was one of the first works in which he displayed his new and strange world of sound, and the three late sonatas, one for violin, one for cello, and the third for flute, viola, and harp are elliptical, compressed pieces which seem to be questing disjointedly into new regions of sound. His songs too, are worthy of investigation, and his piano music, especially the twenty-four Preludes and some of the shorter pieces, contain some of his most imaginative and original ideas and thoughts.

Gabriel Fauré (1845–1924) is a difficult figure to place. He lived through all kinds of musical revolutions yet they seemed to affect the character of his work very little. He has never been, and is never likely to be, a widely known or popular composer, yet his music has a reticence and delicacy that is very appealing. Despite his dreamy, retiring art he was not a recluse, but a very sociable

He was content with forms as he found them, but he imbued them with a very personal, human style. Perhaps his art is best heard in his songs. They are not overtly passionate or dramatic but the long, sinuous melodies and subtle harmonies are exquisitely wrought. Of the song-cycles, *La Bonne Chanson*, *Cinq Mélodies* (Verlaine), *Le Chanson d'Eve*, and *L'Horizon Chimérique* are best known. The last written in 1922, when the composer was seventy-seven, is a beautiful setting of words by a soldier killed in the first World War. There are also many remarkable single songs, many of them settings of poems by Verlaine.

He wrote few orchestral pieces, but the *Ballade* for piano and orchestra and the *Pavane* are among his most typical, and delicate compositions, and his outstanding piano music, modelled on Chopin's, includes Nocturnes, Impromptus, and Barcarolles. His chamber music covers more than half a century from the violin sonata of 1876 to the string quartet written the year he died. In that period he composed two piano quartets, two piano quintets, another violin sonata and two cello sonatas, the later works failing to show quite the unforced lyrical grace of the earlier ones. Perhaps Fauré is best approached with the first piano quartet, a charming, easily assimilated work, and the beautiful choral *Requiem*.

Saint-Saëns (1835–1921), an accomplished, cultivated musician, has had a "bad press" but his craftsmanship, as displayed in his symphonies, concertos, and *Samson et Dalila* (one among his 12 operas) is not to be despised.

Henri Duparc (1844–1933), despite a very long life, is known today only for a group of songs he wrote before he was forty. They are among the most emotionally direct yet tasteful melodies ever written. Paul Dukas (1865–1935) is another figure off the beaten track, as it were. He, too, is known only for a handful of compositions. He was strongly influenced by Vincent d'Indy (1851–1931) and the school who strongly opposed Debussy's new ideas, yet he could not help but come under Debussy's spell. Dukas's one great work is his opera *Ariane et Barbe-Bleue*, the text adapted from a Maeterlinck play written with the composer in mind.

Maurice Ravel (1875–1937), a pupil of Fauré, followed in Debussy's footsteps, although his later pieces were more ascetic. Indeed, he was one of the most fastidious of composers, always seeking, and often finding, artistic perfection. The works he wrote before 1918 are definitely of the Impressionist School and it would be difficult to imagine more beautiful sounds than are to be found in the ballet *Daphnis et Chloé*, in the song-cycle *Shéhérazade*, and the piano fantasy *Gaspard de la Nuit*. His first style was summed up in the A minor piano trio (1915). In his later music Ravel was struggling, not always successfully, to keep up with new developments such as jazz and atonality. The piano concerto, for instance, shows very strongly the influence of jazz.

Outstanding orchestral works of his, other than *Daphnis* are *Rapsodie espagnole* (1907), *La Valse* (1920), a sumptuous evocation of the Vienna waltz, and the ever-popular *Boléro*. Two chamber works, besides the trio, are masterpieces—the string quartet (1902–3) and the Introduction and Allegro for Harp, String Quartet, Flute, and Clarinet. This Septet composed in 1906, ravishes the senses with magical sound.

Ravel's piano pieces are perhaps his most notable contribution to music, combining an extraordinary feeling for the instrument's technical possibilities with the sensibility of a Chopin, and in this field *Jeux d'eau*, *Miroirs*, and *Ma Mère l'Oye*, all written just after the turn of the century, come very close to the perfection of *Gaspard de la Nuit*. His songs show his unusual appreciation of the need to fuse poetic and musical values, and he set exotic poems for preference. The song-cycle *Histoires naturelles* (1906) is an acutely observed setting of five poems about birds and animals; *Cinq Mélodies populaires Grecques* (1907) are charming settings of Greek folk songs; *Trois Poèmes de Mallarmé* (1913), *Chansons Mendécasses* (1926), are suitably exotic settings of three poems by an 18th-cent. Creole poet called Parny. Finally in 1932 came *Don Quichotte à Dulcinée*, three poems by Paul Morand, Ravel's last composition.

Ravel wrote two operas—the slight but moderately amusing *L'Heure espagnole* (1907), nicely orchestrated in a faintly and appropriately Spanish style and *L'Enfant et les Sortilèges* (1925) to a story by Colette, a delicious fantasy about a naughty child who gets his due punishment for tormenting animals and destroying furniture.

Spain.

Felipe Pedrell (1841–1922) has been aptly described as the midwife of Spanish nationalist music. As a musicologist and teacher he strongly influenced the two main composers of the school, Manuel Falla (1876–1946) and Enrique Granados (1867–1916). Falla's output was not large and most of it was written about the time of the first World War. He had spent the years before the war in Paris and there he naturally came under the influence of Debussy. Debussy wrote Spanish music without ever having been to Spain but so true was it that even to Falla, born and bred in Andalusia, it had new things to say. He was able to take something from Debussy and blend it with his own highly individual style, evoking in his music all the passion and gaiety of his native land. Perhaps his most typical works are the two ballets *Love the Magician* (1915) full of Spanish atmosphere, and *The Three-Cornered Hat* (1919). The opera *La Vida Breve* (1905), despite its weak libretto, has much appeal, especially when the leading rôle is sung by such a vibrant artist as Victoria de los Angeles. The Seven Popular Spanish Songs (1914) conjure up the vivacity and

smouldering passion at the heart of the country's character, as does *Nights in the Garden of Spain* (1916), an evocative piece for piano and orchestra. His later works, especially the harpsichord concerto of 1926, show Falla tending towards a less ebullient, more neo-classical style. His second opera *Master Peter's Puppet Show* (1923) is a miniaturist work, refined and intense. His third opera *Atlantida*, left unfinished at his death, was completed by his pupil Ernesto Halffter and first staged in 1962. It is a long work, more a dramatic cantata than an opera, and as such a rather unwieldy epic.

Granados, who was drowned when his ship was torpedoed by the Germans in 1916, was perhaps a more restrictedly Spanish composer than Falla, but his music is unfailingly attractive, and surely others of his seven operas, besides *Goyescas* (which is heard occasionally), deserve to be rescued from oblivión. *Goyescas* itself is especially famous for the second interlude and opening of Act III—*La Maja y el Ruiseñor* (The lover and the nightingale), a haunting, sinuous melody for soprano, sometimes heard in its original form as a piano solo. He wrote a set of *Tonadillas*. A tonadilla is a type of Spanish song popular in the 18th cent., and Granados's set ably and enchantingly recaptures a lost age of grace and character. His exciting Spanish Dances are heard in both their piano and orchestral form.

The chief claim to fame of Albéniz (1860–1909) is *Ibéria*, masterly descriptive pieces for piano. Turina (1882–1949), not altogether successfully, attempted a more cosmopolitan style, but his most often heard music, especially that for guitar, is typically Spanish.

The Late German Romantics.

While composers such as Debussy, Sibelius, Stravinsky, and Schoenberg (see below for the latter pair) were striking out along new paths, Richard Strauss (1864–1949) continued in the trend of 19th-cent. German composers; he was the tradition's last great figure. At least two of his operas—*Salome* and *Elektra*—were considered shocking at the time, but today we can hear that they are essentially big-scale, romantic works—natural successors to Wagner's—however startling the harmonies may once have seemed.

If Strauss did not achieve the granite intellectual greatness of Beethoven or Wagner, there is no denying his melodic genius and powers of fertile invention which overlaid the streak of vulgarity and inflation in his musical make-up. His first outstanding achievement was in the field of the symphonic poem, where he carried the work of composers such as Liszt and Berlioz to its logical conclusion. Starting with *Don Juan* in 1888 and ending with *Sinfonia Domestica* in 1903 he wrote a series of kaleidoscopic works, full of enormous vitality, endless melody, and fascinating orchestration. The most easily assimilated—and the most popular—are *Don Juan* and *Till Eulenspiegel* but some of the longer works, notably *Also Sprach Zarathustra* (based on Nietzsche's prose poem) and *Don Quixote* (based, of course, on Cervantes's great work) will reward the persistent, inquiring mind with long hours of enthralled listening. Other works sound somewhat dated in their bombastic over-confidence, though Strauss's skill in composition seldom flagged at this stage of his long creative career. The symphonic poems all tell something of a story usually based on a literary source, but it is not essential to the enjoyment of the music to know what this is, although it may be helpful.

Strauss's reputation is even more solidly based on his fifteen operas, the earliest of which *Guntram* was first performed in 1894, the last, *Capriccio*, in 1942. During these years the essentials of Strauss's style changed little, though it became very much more refined as the years passed. His first operatic period ended with the violent, sensuous tragedies *Salome* (1905) and *Elektra* (1909), the latter being his first collaboration with his chief librettist Hugo von Hofmannsthal. Then came their unique *Der Rosenkavalier* (1911), which filters the charm and the decadence of 18th-cent. Vienna through early 20th-cent. eyes. This was followed by *Ariadne auf Naxos* (1912). Originally intended to be given after Molière's *Le Bourgeois Gentilhomme*, it was later presented (1916) without the play but with a preceding scene, written by von Hofmannsthal. *Die Frau ohne Schatten* is the most grandiose result of the Strauss-Hofmannsthal partnership. It is a complex psychological allegory, but Strauss's contribution is not on as consistently lofty a level as is his librettist's. *Intermezzo* (1924), which has a libretto by Strauss himself, is a largely autobiographical domestic comedy, which has lately gained in reputation as a compact, charming piece. With *Die Aegyptische Helena* (1928), an opera on a mythical theme, and *Arabella* (1933), another charming Viennese comedy, the Strauss-Hofmannsthal collaboration ended on account of the librettist's death. Strauss then wrote *Die Schweigsame Frau* (1935) to a libretto by Stefan Zweig, based on a play by Ben Jonson, and *Friedenstag* (1938), *Daphne* (1938)—a beautiful opera—and *Die Liebe der Danae* (written 1938–40) with Josef Gregor as librettist. His swan-song was *Capriccio*, a dramatisation of the old argument about the relative importance of words and music in opera. The libretto is by the conductor Clemens Krauss and the opera, a serene, melodious work, was a fit end to a great operatic career.

However, Strauss went on composing till nearly the end of his life, adding a group of late orchestral pieces to his already large catalogue of works. The *Metamorphoses* for 23 solo string instruments, is probably the best of these. During his long creative career he wrote numerous songs, many of them, such as *Morgen*, *Wiegenlied* and *Ruhe, meine Seele* of surpassing beauty.

Other notable figures in German music at this time were Max Reger (1873–1916), a somewhat ponderous but highly accomplished composer who, in a quarter of a century of creative life, wrote more than 150 works, of which his sets of variations, his piano concerto, and chamber music are probably the most impressive. Hans Pfitzner (1869–1949), another German traditionalist, is chiefly remembered today for his opera *Palestrina*, about events, now known to be spurious, in the life of the 16th-cent. Italian composer.

Mahler.

Gustav Mahler (1860–1911), the Austrian Jewish composer, is one of the most important figures in 20th-cent. music. In a sense he bridges the gulf between the late Romantics, who were tending more and more towards chromaticism and away from established key relationships, and the atonalists, who abandoned key signatures entirely. His detractors maintain that his inflation of allegedly banal Viennese beer-house music to unheard-of lengths rules him out of court as a serious writer. His admirers would claim that his music encompasses the whole of life in enormous, valid structures. The truth, if truth there be, perhaps lies somewhere in between: that if his material does not always justify the length of his symphonies, if there are occasional imperfections and *longueurs*, these shortcomings are worth putting up with for the sake of the depth of utterance, the humanity and the poetry of the great pages. He admitted himself that "I cannot do without trivialities," but it is out of these impurities that he forged his titanic victories.

His music is undoubtedly best approached through his songs, where the words force him to discipline his wide-ranging vision. *Lieder eines fahrenden Gesellen* (1884), to his own words, *Kindertotenlieder* (1901–4), to poems by Rückert, and some individual songs perfectly relate words to music, and are all of a poignant loveliness. Similarly *Das Lied von der Erde* (1908), especially the last of the six songs, is a touching farewell to the world, nobly expressed.

The ten symphonies, however, are Mahler's most impressive legacy to posterity. They are almost impossible to characterise briefly so vast are they in terms of both length and variety. The first, fourth and ninth are probably the easiest

to grasp but the fifth, sixth and seventh, despite flaws, contain some of his most awe-inspiring conceptions. The second and third, both of which use soloists and chorus, are revolutionary in layout and concept; they both try, inevitably without complete success, to carry out the composer's dictum, "a symphony should be like the world—it must contain everything." The eighth is even more gargantuan, but as in all Mahler's work size does not mean loss of clarity or an overloading of the structure. Part one—a mighty choral invocation—is a visionary setting of the mediaeval hymn *Veni Creator Spiritus*. Part two, which incorporates adagio, scherzo, and finale in one, is a setting of the final scene of Goethe's *Faust*. Until recently all of Mahler's unfinished tenth symphony that was ever performed was the Adagio, but the musicologist and Mahler scholar, Deryck Cooke, has recently completed the symphony to critical and popular acclaim and thus added a noble, and also optimistic epilogue to the Mahler opus. The debate over the quality of Mahler's music is likely to continue: one fact, however, that cannot be gain-said is his popularity with an ever-increasing audience, many of them young people. There must be something in his uncertainty and intense self-inquiry that accords with the mood of today.

Schoenberg and the Second Viennese School.

Arnold Schoenberg (1874–1951) revolutionised Western music by his twelve-note theory—a system which uses all the notes of the chromatic scale "and denies the supremacy of a tonal centre," as Schoenberg himself puts it. This serial technique of composition, as it is commonly called, naturally sounds strange to an ear acclimatised to music written, as it were, with a home base, but Schoenberg and his disciples Berg and Webern showed that the system could produce works that were something more than mere intellectual exercises. None of the more recent advances in music would have been possible, even thinkable, without Schoenberg's pioneer work.

Schoenberg always regarded himself as much as a composer as a theorist or teacher, and his works are supposed to appeal as much to the emotions as to the intellect, although to be understood they do, of course, require the listener's concentrated attention. To appreciate how his ideas developed it is necessary to hear first his pre-atonal music, such as the *Gurrelieder* (1900–1) and *Verklärte Nacht* (1899), in which he carried Wagnerian chromaticism to extreme lengths. The *Gurrelieder*, in particular, is a luxuriant, overblown work that shows the Wagnerian idiom in an advanced stage of decay, in spite of many beautiful pages of music. In his succeeding works the feeling of tonality began to disappear until in the Three Piano Pieces (opus 11), of 1909, he finally rejected tonality, although the new 12-note scheme is not yet evident; traces of the old order can still be heard. The succeeding works were mostly short, highly compressed, and very expressive. Schoenberg was reaching out for a new system, which would "justify the dissonant character of these harmonies and determine their successions." By 1923 he had formulated his 12-note system and the Five Piano Pieces (opus 23), and the Serenade (opus 24) of that year, can thus be considered the first works that used a note-row as the fundamental basis of their composition. Between 1910 and 1915, however, the Russian composer Alexander Scriabin (1872–1915) had attempted to define a new method of composition of his own employing the "mystic chord" of ascending fourths, but his scheme proved comparatively abortive when compared with Schoenberg's. Josef Hauer (1883–1959) also developed a 12-note system which he propounded in 1919 and he always considered himself, rather than Schoenberg, as the true founder of the system. He later worked out a system of tropes (*i.e.*, half-series of six notes).

To return to Schoenberg, in later works he shows much more freedom and assurance in the use of his system. The wind quintet (1924), the variations for orchestra, opus 31 (1927–8), the third (1926), and fourth (1936) string quartets, and the string trio (1946) are modern classics of their kind: they require concentrated listening and a degree of understanding of the unfamiliar style of composition. The set of songs with piano *Das Buch der hängenden Gärten* (opus 15), written in 1908, *Pierrot Lunaire*, opus 21 (1912) and the Four Songs, opus 22 (1913–14) provide a kind of bridge between tonality and atonality that the adventurous mind should cross. The monodrama *Erwartung* (1909) is another fascinating work, but perhaps the unfinished *Moses and Aaron* (1932) is Schoenberg's masterpiece as its production at Covent Garden in 1965 showed. Here, for certain, the composer matched his obvious intellectual capacities with an evident emotional content and managed to combine *Sprechgesang* (speech-song) and singing with a real degree of success.

It is only in recent years that Schoenberg's music has had a real chance to make its mark through the essential prerequisite of frequent performance. If his idiom now seems approachable, and a reasonably natural outcome of late 19th-cent. developments, it is perhaps because other, more recent composers have extended the boundaries of sound much further.

Schoenberg's two most respected disciples were Anton Webern (1883–1945) and Alban Berg (1885–1935). Webern's output is small, reaching only to opus 31, and many of his works are very brief. They are exquisitely precise, and delicate almost to a fault. He was trying to distil the essence of each note and in so doing carried the 12-note system to its most extreme and cerebral limit. His music has often been described as pointillist in the sense that one note is entirely separated from the next, there being little discernible melody. Beyond Webern's music, there is indeed the sound of nothingness, and he was rightly described during his lifetime as the "composer of the *pianissimo espressivo*". In his later works, Webern tended towards a strict, and often ingenious use of form and the Variations for Orchestra of 1940 are a good example of this and of his delicacy of orchestration. Webern's influence has perhaps been greater than the impact of his own music, even though he has had no direct successor.

Berg's music is much more accessible. Like Webern his total output was not large but nearly all his works are substantial additions to the repertory. He is also the directest link between Mahler and the second Viennese School, as Mahler's music influenced him strongly. He studied with Schoenberg from 1904 to 1910. His music is more intense, more lyrical, and less attenuated in sound than Schoenberg's or Webern's. His humanity and abiding compassion can be heard most strongly in his finest opera *Wozzeck* (1925) and his violin concerto (1935), written as an elegy on the death of Manon Gropius, a beautiful 18-year-old girl. Both works are very carefully designed yet formal considerations are never allowed to submerge feeling, and the note-row is fully integrated into the structure.

Both *Wozzeck* and the unfinished but rewarding *Lulu* are concerned with society's outcasts who are treated with great tenderness in both operas. The later work is entirely dodecaphonic, all the opera's episodes being based on a theme associated with Lulu. Between these operas Berg wrote the highly complex Chamber Concerto for piano, violin, and thirteen wind instruments (1925) and the expressive Lyric Suite (1926). Among his early works the Seven Early Songs (1908–9) and the concert aria *Der Wein* (1929) are notable.

Stravinsky.

Igor Stravinsky (b. 1882) is another vital figure in 20th-cent. music. If his influence has been in quite another and perhaps less drastic direction than Schoenberg's it is hardly less important. Indeed, future musical historians may consider his achievement the more significant. He has been compared with the painter Picasso in his almost hectic desire to keep up with the times, yet, although he has written in a number of very different styles during the past fifty years, every work of his is stamped with his own definitive

musical personality. His most revolutionary and seminal work is undoubtedly *The Rite of Spring* (written for the ballet impresario Diaghilev), which caused a furore when it first appeared in 1913, and although it no longer shocks, the rhythmical energy, the fierce angular thematic material, and the sheer virtuosity of the orchestration will always have the power to excite new audiences. Before *The Rite* Stravinsky had written two ballets for Diaghilev—*The Firebird* and *Petrushka*—that are no less filled with vitality and new, albeit not so violent, sounds. During the next thirty years Stravinsky wrote a series of ballet works, gradually becoming more austere and refined in composition. *Apollo* (1928) and *Orpheus* (1947) belong among his most attractive scores.

Stravinsky has not confined himself in stage works to the ballet. *The Nightingale* (1914) is a charming, early opera; *The Soldiers Tale* (1918) is a witty combination of narration, mime, and dance; *Les Noces* (1923) is a concise, original choreographic cantata for soloists and chorus; *Oedipus Rex* (1927) is a dignified version of the Sophocles play, which can be staged or given on the concert platform; either way it is a moving experience. *Perséphone* (1934), a melodrama for reciter, tenor, chorus, and orchestra is an appealing, lucid score. Since the war his most important stage work by far has been *The Rake's Progress* (1951), with a libretto by W. H. Auden and Chester Kallman. This fascinating opera is deliberately based on 18th-cent. forms and the music itself is neo-classical, always attractive, sometimes haunting.

Stravinsky has been no laggard in writing for the concert-platform either. The finest of these works are probably the fervent impressive choral *Symphony of Psalms* (1930), the Violin Concerto (1931) and the aggressive compact Symphony in three movements (1945). Of his chamber music the Octet (1923), a Duo Concertant (1932), and Septet (1952) are probably the most important, but no piece, even the dryest and most pedantic, is without redeeming features.

Stravinsky is often thought of as an aloof, detached figure. He has been castigated for his lack of lyrical warmth. But in spite of his own professed desire to drain his music of specific emotion, craftsmanship and originality, often with a strange other-worldly beauty added, are unmistakeably there throughout his many scores. Quirky and annoying he may be, dull never.

Busoni and Puccini.

Italian music in the early part of the century was dominated by two very different composers—Ferruccio Busoni (1866–1924) and Giacomo Puccini (1858–1924). Busoni is a difficult figure to place. His austere, intellectual power is never called in question, but he seldom, if ever, succeeded in translating his technical prowess into altogether successful compositions. We can admire the strength, honesty, and often beauty of such works as his huge piano concerto (1903–4), *Fantasia Contrappuntisca* (1912)—for piano solo—and his unfinished opera *Doktor Faust* without ever capitulating to them entirely. None the less, it has to be admitted that those who have studied his music closely have always fallen completely under his spell. In style his music is anti-Romantic and often neo-Classical yet he was an ardent admirer of Liszt and more especially of Liszt's realisation of the possibilities of the pianoforte. Busoni, himself a great pianist, carried on where Liszt had left off in his own piano music, in which form and expression often find their perfect balance. *Doktor Faust* is undoubtedly his most important opera but *Die Brautwahl* (1908–10) and *Turandot* (1917) have many points of interest too.

Puccini's *Turandot*—his last opera—is a much grander version of the same Gozzi fable and the culmination of this great opera composer's work. His achievement is at an almost directly opposite pole to Busoni's. Not for him the severity or intellectuality of his contemporary. He sought and found an almost ideal fusion of straight-forward lyricism and dramatic truth. His music unerringly follows the pathos and passion of the stories he sets and all his characters "live" as human beings. That, and his abundant flow of easy, soaring melody, are the reasons for his immense popular success, unequalled by any other 20th-cent. composer. Whether it is the pathetic Mimi (*La Bohème*—1896) and Cio-Cio-San, (*Madama Butterfly*—1904), the evil Scarpia, (*Tosca*—1900), the cunning Schicchi (*Gianni Schicchi*—1918), the ardent Rudolfo (*La Bohème*) and Cavaradossi (*Tosca*), or the ice-cold Turandot (*Turandot*—1926), Puccini's musical characterisation is unfailing. And he backs his *verismo* vocal writing with an orchestral tissue that faithfully reflects the milieu of each opera, for instance, Japanese for *Butterfly*, Chinese for *Turandot*, while never losing his particular brand of Italian warmth. His orchestration is always subtle and luminous.

Other Italian composers who wrote operas in the *verismo* style of Puccini were Leoncavallo (1858–1919), Mascagni (1863–1945), and Giordano (1867–1948).

Prokofiev, Shostakovich, and Rachmaninov.

Sergey Prokofiev (1891–1953) spent part of his creative life in his native Russia, part of it (1918–34) abroad, mostly in Paris. His early music, apart from the popular Classical Symphony (1916–17) tended to be acid and harsh, but on his return to Russia his style, though still frequently satirical, became warmer, more Romantic. The third piano concerto (1917) and the second symphony (1924) are good examples of the former period, the ballets *Romeo and Juliet* (1935) and *Cinderella* (1941–44) and the fifth (1944) and sixth (1949) symphonies of the latter. His music gives the impression of immense rhythmical energy, as in the outer movements of several of his nine piano sonatas, but this fierce drive is often leavened by the soft, wistful lights of his slow movements. His second string quartet (1941), perhaps, presents all the elements of his music in the kindest light.

His strong leaning towards fantasy and mordaunt parody is felt in his earlier operas *The Love of the Three Oranges* (1921) and *The Fiery Angel* (1922–25). *War and Peace* (1941–42) was written in the face of strong pressure from the Soviet authorities.

Dmitri Shostakovich (b. 1906) has also suffered from attacks of "formalism". He had to conform to Stalin's requirements for writing music, but he has survived and continues to produce music of universal appeal, as, for example, his most recent string quartets. Like Prokofiev, his music falls into two very distinct styles: one humorous and spiky, the other intense, very personal and often large-scale in its implications. Not all his twelve symphonies reach the expressive depths of numbers one, five, six, and eight, but they all have rewarding passages and his recent violin and cello concertos are of high quality. He has so far written eleven string quartets, a piano quintet (an attractive piece) and two operas: the satirical *The Nose* (1930) and *Katerina Ismailova* (1934, revised 1959), originally known as "Lady Macbeth of Mstensk." It is much too early to "place" Shostakovich in musical history, but his original genius cannot be doubted.

Although Sergey Rachmaninov (1873–1943) was born in Russia, he left his home country in 1918, disliking the Soviet régime, and lived mostly in Switzerland and the United States. His music is chiefly notable for its Romanticism, nostalgic melody, nervous energy and, in the piano works, its opportunities for displays of virtuosity. The first three piano concertos, the third symphony, the piano preludes, and the Rhapsody on a theme of Paganini, are his most typical and attractive works, and many of his songs are touching and beautiful. He wrote three operas.

Modern French Music.

French music after Debussy and Ravel was dominated by the slighter composers known as *Les Six*, the most important of whom were Arthur

Honegger (1892–1955, Swiss born), Darius Milhaud (b. 1892) and Francis Poulenc (1899–1963). Each has contributed music of some wit and charm to the repertory. They were influenced by Erik Satie (1866–1925), an eccentric but interesting figure, who wrote works with odd titles such as *Three Pear-Shaped Pieces*. His music is entirely unsentimental, often ironic.

Much more revolutionary has been the work of Olivier Messiaen (b. 1908), who has turned to Indian music and, above all, to bird-song for inspiration. He first came to notice as a composer of organ music. Then his *Quatuor pour la fin de temps*, written in captivity between 1940 and 1942, his long piano pieces, based on bird-song (often literally) and his gigantic *Turangalila* symphony show him experimenting with complex rhythms, strange sonorities (using unusual instruments such as the Ondes Martenot in the symphony), and considerably widening music's horizons. Edgar Varèse (1885–1965) cultivated an even broader spectrum of sound, employing electronic instruments to complement and contrast with traditional ones. Pierre Boulez (b. 1925), a pupil of Messiaen, bases his extremely complex works on mathematical relationships. His music, other than that for the piano, mostly calls for a variety of percussion instruments often combined with the soprano voice in evocations of of French poetry (Mallarmé in particular). The resulting timbre and sonorities are intriguing even when the intellectual basis of the music is but dimly perceived.

Modern German Music.

Kurt Weill (1900–50) is chiefly known for his socio-politically pointed operas, such as *Die Dreigroschenoper* (1929), *Mahagonny* (1929), *Der Jasager* (1930), and *Happy End* (1929), all effective works on the stage, and for his particular brand of brittle, yet fundamentally romantic music. His influence on later composers has been considerable.

Carl Orff (b. 1895) has written chiefly for the stage. His music is rhythmically insistent, avoids counterpoint, and is deliberately, even self-consciously straightforward. Most frequently heard is his *Carmina Burana*, lively, rumbustious choral settings of mediæval poems.

Paul Hindemith (1895–1964) in his later years wrote in a strictly tonal, often neo-classical idiom, after being one of the most advanced intellectuals of his time. As well as many chamber and orchestral works, he wrote three formidable operas: *Die Harmonie der Welt*, *Cardillac* and *Mathis der Maler*.

Karlheinz Stockhausen (b. 1928), a pupil of Messiaen, is another extreme innovator. He more than anyone puts electronics to musical use. His scores are a maze of diagrams and instructions, which really need the composer's presence for their true interpretation. It is too early to say whether his music is evidence of a passing vogue or a real step forward in musical ideas.

Hans Werner Henze (b. 1926) has rebelled against the musical climate in Germany, and now lives in Italy, yet his music combines the intellectuality of the modern German schools with the lyricism of Italian music. He has written five symphonies, though none follow the traditional form, and nine operas, among them two impressive large-scale works, *König Hirsch* (1952–55) and *The Bassarids* (1966), to an Auden-Kallman libretto.

American Music.

It was not until the 20th cent. that American music really got under way and an American school came into being. With the possible exception of MacDowell (1861–1908) no earlier composers are remembered or played today. Many composers of the American school have, of course, taken their cue from Europe but the influence of American jazz and folk-song is also recognisable in some of their music. Aaron Copland (b. 1900) is probably the most important figure on the current scene, and such works as *Appalachian Spring*, *Billy the Kid*, and his third symphony have gained a certain amount of international recognition and popularity. Samuel Barber (b. 1910) works along traditional lines and his music, like Copland's, is essentially diatonic. He has contributed to all the usual forms (symphony, concerto, sonata), most recently to opera with *Vanessa* (1958) and *Antony and Cleopatra* (1966), which opened the new Metropolitan Opera House in New York's Lincoln Centre. Roy Harris (b. 1898) has written seven symphonies and several concertos, which include folk elements.

Charles Ives (1874–1954) has recently been recognised as the most original American composer. While carrying on a highly successful career in insurance, Ives yet managed to anticipate in his works, all written before 1920, many of the innovations which were later "invented" in Europe. His orchestral music is much influenced by the sounds, such as brass bands, which he heard in his native New England as a boy. His *Three Places in New England* and *The Unanswered Question* have a beautiful, elusive quality about them. In his five symphonies and *Concord* sonata we notice the working of an original mind employing polytonality and polyrhythms in larger and more complex works. An element of improvisation is sometimes introduced, another anticipation of latter-day technique. Ives is unlikely ever to become a popular composer—his music is too complicated and eclectic for that—but his importance as a prophet is surely established.

Modern English School.

The amazing 20th cent. revival of music in England owes much to Ralph Vaughan Williams (1872–1958) and Gustav Holst (1874–1934). Vaughan Williams's music is today suffering a decline in reputation, but the best of his symphonies (one, four, five, and six), his Fantasia on a theme by Tallis, his ballet *Job*, and the best of his choral music have a sturdiness about them that will no doubt weather the whim of passing fashion. His music alternates between the forceful and the contemplative and both moods are expressed in a distinctive musical vocabulary, based on modalism and 16th-cent. polyphony.

Holst was a more enigmatic figure, but his influence has undoubtedly been greater. Only his suite *The Planets* and the choral *The Hymn of Jesus* have established themselves as repertory works, but his bold harmonic experiments and the austerity, even mysticism, of his style as heard in the orchestral pieces *Egdon Heath*, *Beni Mora*, and the opera *Savitri* are perhaps more typical of this contemplative original composer. His daughter Imogen, a conductor, has done much to promote understanding of her father's music. Contemporaries who deserve a bare mention are John Ireland (1879–1962) and Sir Arnold Bax (1883–1953).

Frederick Delius (1862–1934) was the only important English disciple of the French impressionist school. He lived in France from 1884 onwards. His most important works are the atmospheric orchestral scores, such as *Brigg Fair* and the vocal works *Sea Drift* and *A Mass of Life*.

Of the more recent generation of English composers the most important are undoubtedly Benjamin Britten (b. 1913) Sir Michael Tippett (b. 1905), Alan Rawsthorne (b. 1905), and Sir William Walton (b. 1902). Britten has done more than anyone to establish English music on the forefront of the international stage. Much of his music seems to have an immediate appeal to large audiences and certainly his many stage works have earned him a quite exceptional prestige both at home and abroad. *Peter Grimes* (1945), *Billy Budd* (1951), *Gloriana* (1953), *A Midsummer Night's Dream* (1960) all, in their very different ways, show his consummate mastery of stage technique and the first two are also moving human documents. On a smaller scale he has achieved as much with his chamber operas—*The Rape of Lucretia* (1946), *Albert Herring* (1947),

and *The Turn of the Screw* (1954, based on a Henry James novel)—and with the two recent Parables for Church Performance—*Curlew River* (1964) and *The Burning Fiery Furnace* (1960). If he had written nothing else, those dramatic works would have marked him out as a composer of outstanding imaginative gifts.

But there is more—the choral works culminating in the *War Requiem* (1962), his various song cycles written for the tenor Peter Pears, the Serenade for tenor, horn, and string, *Nocturne* for tenor and orchestra, the three Canticles, and the Spring Symphony are further evidence—in very different media—of both his intense emotional commitment and his technical skill. While being strongly influenced by such composers as Schubert, Verdi, Mahler, and Berg, his style is entirely his own: it is a musical personality that manages to combine, as it has been said, " a deep nostalgia for the innocence of childhood, a mercurial sense of humour and a passionate sympathy with the victims of prejudice and misunderstanding."

This last quality is particularly evident also in Tippett's emotional makeup as expressed in his music, especially in one of his earliest successes, the choral work *A Child of Our Time* (1941), which shows both his compassion and his ability to write on a large scale. But Tippett is as much a mystic and searcher as a composer and he is constantly seeking new and different ways of widening his listeners' horizons, as may be heard in the exceedingly complex *Vision of St. Augustine* (1965), which tellingly sets to music the striving to understand the " beyond " of Augustine's words.

Tippett has also sought new means of musical expression as he has shown in his second opera *King Priam* (1962), very spare and pointed in idiom, and in the concerto for orchestra (1962). These works, as well as his piano concerto (1956) and second symphony—a luminous work—and his three string quartets, are very difficult to perform —and to get to know—but the effort to understand the composer's wide-spanning mind is always richly rewarded. However, perhaps a newcomer to his music does better to approach him through the more straightforward earlier works, the concerto for double string orchestra (1939), the Fantasia Concertante on a theme of Corelli (1953) —a lyrically poetic piece—or the song cycles *Boyhood's End* (1943) and *Heart's Assurance* (1957). The quality of his allegorical opera *The Midsummer Marriage* (1952), in spite of its involved libretto (by the composer), may be better appreciated when it is revived at Covent Garden in 1968. Tippett is an uncompromising individualist, writing without fear or favour, perhaps considerably in advance of his time in thought and achievement.

Rawsthorne's style is admirably direct and honest. Eschewing the latest fashions in music he has ploughed his own furrow of deeply felt writing. His ideas are argued out with considerable lyrical force, and his astute regard for form does not hide the underlying emotional content of his music nor the touch of wit that pervades some of his more lively movements. Among his most important accomplishments to date are his three string quartets, violin concerto, two piano concertos, and the quintet for piano and wind instruments.

Walton's outstanding contribution was made before the second World War in music that was alternately gay and romantic. The irreverent *Façade* (1922) for speaker and chamber orchestra falls into the former category, the poetic viola concerto (1930) into the second. His first symphony (1934) is an arresting, dramatic score, and the oratorio *Belshazzar's Feast* (1929–31) is a landmark in choral music. Since the war his works have never quite recaptured the same urgency of expression.

Elisabeth Lutyens (b. 1906) is Britain's leading twelve-note composer. For long shunned by the musical establishment, she has now been accepted as an important and seminal figure in the history of 20th-cent. music. Her output has been large and includes numerous works for unusual, small groups of instruments, often combined with a solo voice. Benjamin Frankel (b. 1906), Edmund Rubbra (b. 1901), Sir Arthur Bliss (b. 1891), and Lennox Berkeley (b. 1903) are other composers of note among the senior school of living British composers. Egon Wellesz (b. 1885), Austrian born, settled in this country in 1939. He has written operas, choral works, symphonies, and chamber music, and is still active. There is a thriving junior school of British composers who have already made their mark, among them Alexander Goehr, Richard Rodney Bennett, Malcolm Williamson, and Nicholas Maw, each of whom has written one or more operas.

Where Does the Future Lie?

It is anybody's guess which way music will develop during the next few decades. Are older forms quite outmoded, as some recent innovators suggest, and does the future therefore lie with the electronic music and/or percussive sounds—of Boulez, Stockhausen, Luigi Nono (b. 1924), and their disciples? Or will what has been recognised as musical sound for several generations adapt itself to the new mood abroad? Has atonalism still something to offer or was it a passing phase, already dated and out of fashion? Perhaps the only answer that can be given with certainty is that, as with other centuries, a dozen or so composers' music will survive to delight later generations and that these geniuses will be found among composers who do and say what they must in music without regard to fashion, patronage, or fear of what anyone writes about them. May they be worthy of their rich heritage.

II. GLOSSARY OF MUSICAL TERMS

A. Note of scale, commonly used for tuning instruments.

Absolute Music. Music without any literary descriptive or other kind of reference.

A Capella. Literally " in the church style." Unaccompanied.

Accelerando. Quickening of the pace.

Accidental. The sign which alters a note by a semitone, *i.e.*, ♯ (sharp) raises it; ♭ (flat) lowers it; ♮ restores a note to its original position.

Accompaniment. Instrumental or piano part forming background to a solo voice or instrument that has the melody.

Ad. lib. (L. *ad libitum*). Direction on music that strict time need not be observed.

Adagio. A slow movement or piece.

Aeolian mode. One of the scales in mediæval music, represented by the white keys of the piano from A to A.

Air. A simple tune for voice or instrument.

Alberti bass. Rhythmical accompanying figure made up by splitting a chord. Used extensively in 18th-cent. music and associated with the Italian composer Alberti.

Allegretto. Not quite so fast as *Allegro*.

Allegro. Fast, but not too fast.

Alto. An unusually high type of male voice; also the vocal part sung by women and boys with a low range.

Ambrosian Chant. Plainsong introduced into church music by St. Ambrose, bishop of Milan (d. 397), and differing from Gregorian chant.

Andante. At a walking pace, not so slow as *Adagio* nor as fast as *Allegretto*.

Animato. Lively.

Answer. Second entry in a fugue, usually in the dominant.

Anthem. Composition for use in church during a service by a choir with or without soloists.

Antiphonal. Using groups of instruments or singers placed apart.

Appoggiatura. An ornament consisting of a short note just above or below a note forming part of a chord.

Arabesque. Usually a short piece, highly decorated.

Arco. Direction for string instruments to play with bow.

Aria. Vocal solo, usually in opera or oratorio, often in three sections with the third part being a repeat of the first. An *Arietta* is a shorter, lighter kind of aria.

Arioso. In the style of an aria; halfway between aria and recitative.

Arpeggio. Notes of a chord played in a broken, spread-out manner, as on a harp.

Ars antiqua. The old mediæval music, based on organum and plainsong, before the introduction of *Ars nova* in 14th cent.

Ars nova. Musical style current from 14th cent., more independent than the old style in the part-writing and harmony.

Atonal. Not in any key; hence *Atonality.*

Aubade. Morning song.

Augmentation. The enlargement of a melody by lengthening the musical values of its notes.

Ayre. Old spelling of *air.*

B. Note of scale, represented in Germany by *H.*

Bagatelle. A short, generally light piece of music. Beethoven wrote 26 Bagatelles.

Ballad. Either a narrative song or an 18th-cent. drawing-room song.

Ballade. Instrumental piece in story-telling manner. Chopin wrote 4.

Ballet. Stage entertainment requiring instrumental accompaniment; originated at French court in 16th and 17th cent.

Bar. A metrical division of music; the perpendicular line in musical notation to indicate this.

Barcarolle. A boating-song, in particular one associated with Venetian gondoliers.

Baritone. A male voice, between tenor and bass.

Baroque. A term applied, loosely, to music written in the 17th and 18th cent., roughly corresponding to baroque in architecture.

Bass. The lowest male voice; lowest part of a composition.

Bass Drum. Largest of the drum family, placed upright and struck on the side.

Bassoon. The lowest of the woodwind instruments, uses double reed.

Beat. Music's rhythmic pulse.

Bel canto. Literally "beautiful singing"—in the old Italian style with pure tone and exact phrasing.

Berceuse. Cradle song.

Binary. A piece in two sections is said to be binary in form. The balance is obtained by a second phrase (or section) answering the first.

Bitonality. Use of two keys at once.

Bow. Stick with horsehair stretched across it for playing string instruments.

Brass. Used as a collective noun for all brass or metal instruments.

Breve. Note, rarely used nowadays, with tone value of two semibreves.

Bridge. Wood support over which strings are stretched on a violin, cello, guitar, etc.

Buffo(a). Comic, as in *buffo bass* or *opera buffa.*

C. Note of scale.

Cabaletta. Final, quick section of an aria or duet.

Cadence. A closing phrase of a composition or a passage, coming to rest on tonic (key note).

Cadenza. Solo vocal or instrumental passage, either written or improvised, giving soloist chance to display technical skill to audience.

Calando. Becoming quieter and slower.

Canon. Device in contrapuntal composition whereby a melody is introduced by one voice or instrument then repeated by one or more voices or instruments, either at the same pitch (canon at the unison) or at different intervals (canon at the fifth, for example).

Cantabile. Song-like, therefore flowing and expressive.

Cantata. Vocal work for chorus and/or choir.

Cantilena. Sustained, smooth melodic line.

Cantus firmus. Literally "fixed song." Basic melody from 14th to 17th cent., around which other voices wove contrapuntal parts.

Canzonet. Light songs written in England *c.* 1600.

Carillon. A set of bells in tower of church, played from a keyboard below.

Carol. Christmas song.

Castrato. Artificially-created male soprano and alto, fashionable in 17th and 18th cent. (The castration of vocally gifted boys prevailed in Italy until the 19th cent.)

Catch. A part-song like a round, in vogue in England from 16th to 19th cent.

Cavatina. An operatic song in one section, or a slow song-like instrumental movement.

Celesta. Keyboard instrument with metal bars struck by hammers.

Cello. Four-stringed instrument, played with bow, with a bass range. Comes between viola and double bass in string family.

Cembalo. Originally the Italian name for the dulcimer, but sometimes applied to the harpsichord.

Chaconne. Vocal or instrumental piece with unvaried bass.

Chamber Music. Music originally intended to be played in a room for three or more players.

Chanson. Type of part-song current in France from 14th to 16th cent.

Chant. Singing of psalms, masses, etc., in plainsong to Latin words in church.

Choir. Body of singers, used either in church or at concerts.

Chorales. German hymn tunes, often made use of by Bach.

Chord. Sounding together of several notes, always more than three.

Chording. Spacing of intervals in a chord.

Chorus. Substantial body of singers, usually singing in four parts.

Chromatic. Using a scale of nothing but semitones.

Clarinet. Woodwind instrument with single reed in use since mid-18th cent.

Clavichord. Keyboard instrument having strings struck by metal tangents, much in use during 17th and 18th cent. as solo instrument.

Clavier. Used in German (*Klavier*) for piano, in England for any stringed keyboard instrument.

Clef. Sign in stave that fixes place of each note.

Coda. Closing section of movement in Sonata form.

Coloratura. Term to denote florid singing.

Common chord. *See* Triad.

Common Time. Four crotchets to the bar, 4/4 time.

Compass. Range of notes covered by voice or instruments.

Composition. Piece of music, originated by a composer's own imagination; act of writing such a piece.

Compound time. Any musical metric not in simple time.

Con Brio. With dash.

Concert. Public performance of any music.

Concertato. Writing for several solo instruments to be played together.

Concerto. Work for one or more solo instruments and orchestra.

Concerto grosso. Orchestral work common in 17th and 18th cent. with prominent parts for small groups of instruments.

Concord. Opposite of discord, *i.e.*, notes that when sounded together satisfy the ear. (Conventional term in that its application varies according to the age in which one lives.)

Conduct. To direct a concert with a baton.

Consecutive. Progression of harmonic intervals of like kind.

Consonance. Like Concord.

Continuo. Bass line, used in 17th- and 18th-cent-music, for a keyboard instrument, requiring special skill from performer.

Contralto. A woman's voice with a low range.

Counterpoint. Simultaneous combination of two or more melodies to create a satisfying musical texture. Where one melody is added to another, one is called the other's counterpoint. The adjective of counterpoint is contrapuntal.

Counter-tenor. Another name for male alto.

Courante. A dance in triple time.

Crescendo. Getting louder.

Crook. Detachable section of tubing on brass instruments that change the tuning.

Crotchet. Note that equals two quavers in time value.

Cycle. Set of works, especially songs, intended to be sung as group.

Cyclic form. Form of work in two or more movements in which the same musical themes recur.

Cymbal. Percussion instrument; two plates struck against each other.

D. Note of scale.

Da Capo (abbr. D.C.). A *Da Capo* aria is one in which the whole first section is repeated after a contrasting middle section.

Descant. Additional part (sometimes improvised) sung against a melody.

Development. Working-out section of movement in sonata form. *See* Sonata.

Diatonic. Opposite of chromatic; using proper notes of a major or minor scale.

Diminished. Lessened version of perfect interval, e.g., semitone less than a perfect fifth is a diminished fifth.

Diminuendo. Lessening.

Diminution. Reducing a phrase of melody by shortening time value of notes.

Discord. Opposite of concord, *i.e.*, notes that sounded together produce a clash of harmonies.

Dissonance. Like discord.

Divertimento. A piece, usually orchestral, in several movements; like a suite.

Dodecaphonic. Pertaining to 12-note method of composition.

Dominant. Fifth note of major or minor scale above tonic (key) note.

Dorian Mode. One of the scales in mediæval music, represented by the white keys on the piano from D to D.

Dot. Placed over note indicates staccato; placed after note indicates time value to be increased by half.

Double bar. Two upright lines marking the end of a composition or a section of it.

Double bass. Largest and lowest instrument of violin family; played with bow.

Drone bass. Unvarying sustained bass, similar to the permanent bass note of a bagpipe.

Drum. Variety of percussion instruments on which sound is produced by hitting a skin stretched tightly over a hollow cylinder or hemisphere.

Duet. Combination of two performers; composition for such a combination.

Duple time. Time in which main division is two or four.

Dynamics. Gradations of loudness or softness in music.

E. Note of scale.

Electronic. Term used to describe use of electronic sounds in music.

Encore. Request from audience for repeat of work, or extra item in a programme.

English horn (*Cor anglais*). Woodwind instrument with double reed of oboe family.

Enharmonic. Modulation made by means of change of note between sharps and flats, although note remains the same (E flat becomes D sharp, for example).

Ensemble. Teamwork in performance; item in opera for several singers with or without chorus; a group of performers of no fixed number.

Episode. Section in composition usually divorced from main argument.

Exposition. Setting out of thematic material in a sonata-form composition.

Expression marks. Indication by composer of how he wants his music performed.

F. Note of scale.

False relation. A clash of harmony produced when two notes, such as A natural and A flat, are played simultaneously or immediately following one another.

Falsetto. The kind of singing by male voices above normal register and sounding like an unbroken voice.

Fanfare. Flourish of trumpets.

Fantasy. A piece suggesting free play of composer's imagination, or a piece based on known tunes (folk, operatic, etc.).

Fermata. Pause indicated by sign 𝄐 prolonging note beyond its normal length.

Fifth. Interval taking five steps in the scale. A perfect fifth (say, C to G) includes three whole tones and a semitone; a diminished fifth is a semitone less, an augmented fifth a semitone more.

Figure. A short phrase, especially one that is repeated.

Fingering. Use of fingers to play instrument, or the indication above notes to show what fingers should be used.

Flat. Term indicating a lowering of pitch by a semitone, or to describe a performer playing under the note.

Florid. Term used to describe decorative

Flute. Woodwind instrument, blown sideways. It is played through a hole, not a reed. Nowadays, sometimes made of metal.

Folksong. Traditional tune, often in different versions, handed down aurally from generation to generation.

Form. Course or layout of a composition, especially when in various sections.

Fourth. Interval taking four steps in scale. A perfect fourth (say, C to F) includes two whole tones and a semitone. If either note is sharpened or flattened the result is an augmented or a diminished fourth.

Fugato. In the manner of a fugue.

Fugue. Contrapuntal composition for various parts based on one or more subjects treated imitatively but not strictly.

G. Note of scale,

Galant. Used to designate elegant style of 18th-cent. music.

Galliard. Lively dance dating back to 15th cent. or before.

Gavotte. Dance in 4/4 time, beginning on third beat in bar.

Giusto. Strict, proper.

Glee. Short part-song.

Glissando. Rapid sliding scales up and down piano or other instruments.

Glockenspiel. Percussion instrument consisting of tuned steel bars and played with two hammers or keyboard.

Grace note. *See* Ornament.

Grave. In slow tempo.

Grazioso. Gracefully.

Gregorian Chant. Plainsong collected and supervised mainly by Pope Gregory (d. 604).

Ground bass. Figure on theme used as bass in a composition and constantly repeated without change.

Guitar. Plucked string instrument of Spanish origin, having six strings of three-octave compass.

H. German note-symbol for *B.*

Harmony. Simultaneous sounding of notes so as to make musical sense.

Harp. Plucked string instrument of ancient origin, the strings stretched parallel across its frame. The basic scale of C flat major is altered by a set of pedals.

Harpsichord. Keyboard stringed instrument played by means of keyboard similar to a piano but producing its notes by a plucking, rather than a striking action.

Homophonic. Opposite of polyphonic, *i.e.*, indicated parts move together in a compositon, a single melody being accompanied by block chords, as distinct from the contrapuntal movement of different melodies.

Horn. Brass instrument with coiled tubes. Valves introduced in 19th cent. made full chromatic use of instrument possible.

Hymn. Song of praise, especially in church.

Imitation. Repetition, exactly, or at least recognisably, of a previously heard figure.

Impromptu. A short, seemingly improvised piece of music, especially by Schubert or Chopin.

Improvise. To perform according to fancy or imagination, sometimes on a given theme.

In alt. The octave above the treble clef; *in altissimo*, octave above that.

Instrumentation. Writing music for particular instruments, using the composer's knowledge of what sounds well on different instruments.

Interlude. Piece played between two sections of a composition.

Intermezzo. Formerly meant interlude, now often used for pieces played between acts of operas.

Interval. Distance in pitch between notes.

Ionian mode. One of the scales in mediæval music, represented on piano by white keys between C and C, identical therefore to modern C major scale.

Isorhythmic. Term applied to motets of 14th and 15th cent. where rhythm remains strict although melody changes.

Jig. Old dance usually in 6/8 or 12/8 time.

Kettledrum (Timpani). Drum with skin drawn over a cauldron-shaped receptacle, can be tuned to definite pitch by turning handles on rim, thus tightening or relaxing skin.

Key. Lever by means of which piano, organ, etc., produces note; classification, in relatively modern times, of notes of a scale. Any piece of music in major or minor is in the *key* of its tonic or keynote.

Keyboard. Term used to describe instruments with a continuous row of keys.

Key-signature. Indication on written music, usually at the beginning of each line, of the number of flats or sharps in the key of a composition.

Kitchen Department. Humorous term for percussion section of an orchestra.

Lament. Musical piece of sad or deathly significance.

Largamente. Spaciously.

Largo. Slow.

Leading-motive (Ger. Leitmotiv). Short theme, suggesting person, idea, or image, quoted throughout composition to indicate that person, etc.

Legato. In a smooth style (of performance, etc.)

Lento. Slow.

Libretto. Text of an opera.

Lied. (pl. *Lieder*). Song, with special reference to songs by Schubert, Schumann, Brahms, and Wolf.

Lute. String instrument plucked with fingers, used in 15th- and 16th cent. music especially.

Lydian mode. One of the scales in mediæval music, represented by white keys of piano between F and F.

Lyre. Ancient Greek plucked string instrument.

Madrigal. Contrapuntal composition for several voices, especially prominent from 15th to 17th cent.

Maestoso. Stately.

Major. One of the two main scales of the tonal system with semitones between the third and fourth, and the seventh and eighth notes, identical with 16th-cent. Ionian mode.

Mandolin(e). Plucked string instrument of Italian origin.

Manual. A keyboard for the hands, used mostly in connection with the organ.

Master of the King's (or Queen's) Musick. Title of British court appointment, with no precise duties.

Melisma. Group of notes sung to a single syllable.

Mélodie. Literally a melody or tune; has come to mean a French song (cf. German *Lied*).

Metronome. Small machine in use since the beginning of the 18th cent., to determine the pace of any composition by the beats of the music, *e.g.*, ♩ = 60 at the head of the music indicates sixty crotchets to the minute.

Mezzo, Mezza. (It. = "half") *Mezza voce* means using the half voice (a tone between normal singing and whispering). *Mezzo-soprano*, voice between soprano and contralto.

Minim. Note that equals two crotchets in time value.

Minor. One of the two main scales of the tonal system (cf. major), identical with 16th-cent. Aeolian mode. It has two forms—the harmonic and melodic, the former having a sharpened seventh note, the latter having the sixth and seventh note sharpened.

Minuet. Originally French 18th-cent. dance in triple time, then the usual third movement in symphonic form (with a contrasting trio section) until succeeded by scherzo.

Mixolydian mode. One of the mediaeval scales represented by the white keys on the piano from G to G.

Modes. Scales prevalent in the Middle Ages. *See* Aeolian, Dorian, Ionian, Lydian, Mixolydian, Phrygian.

Modulate. Changing from key to key in a composition, not directly but according to musical "grammar".

Molto. Much, very; thus *allegro molto.*

Motet. Sacred, polyphonic vocal composition. More loosely, any choral composition for use in church but not set to words of the liturgy.

Motive, motif. Short, easily recognised melodic figure.

Motto. Short, well-defined theme recurring throughout a composition, cf. *Idée fixe* in Berlioz's *Symphonie Fantastique.*

Movement. Separate sections of a large-scale composition, each in its own form.

Music drama. Term used to describe Wagner's, and sometimes other large-scale operas.

Mutes. Devices used to damp the sound of various instruments.

Natural (of a note or key). Not sharp or flat.

Neo-classical. Term used to describe music written mostly during the 1920s and 30s in the style of Bach or Mozart.

Ninth. Interval taking nine steps, *e.g.*, from C upwards an octave and a whole tone to D.

Nocturne. Literally a "night-piece", hence usually of lyrical character.

Nonet. Composition for nine instruments.

Notation. Act of writing down music.

Note. Single sound of specified pitch and duration; symbol to represent this.

Obbligato. Instrumental part having a special or essential rôle in a piece.

Oboe. Woodwind instrument with double reed, descended from hautboy; as such, in use since 16th cent., in modern form since 18th cent.

Octave. Interval taking eight steps of scale, with top and bottom notes having same "name": C to C is an octave.

Octet. Composition for eight instruments or voices.

Ondes Martenot. Belongs to a class of melodic instruments in which the tone is produced by electrical vibrations controlled by the movement of the hands not touching the instrument.

Opera. Musical work for the stage with singing characters, originated in early years of 17th cent.

Opera seria. Chief operatic form of 17th and 18th cent., usually set to very formal librettos, concerning gods or heroes of ancient history.

Operetta. Lighter type of opera.

Opus. (abbr. *Op.*) With number following *opus* indicates order of a composer's composition.

Oratorio. Vocal work, usually for soloists and choir with instrumental accompaniment, generally with setting of a religious text.

Orchestra. Term to designate large, or largish, body of instrumentalists, originated in 17th cent.

Orchestration. Art of setting out work for instruments of an orchestra. To be distinguished from *Instrumentation* (*q.v.*).

Organ. Elaborate keyboard instrument in which air is blown through pipes by bellows to sound notes. Tone is altered by selection of various stops and, since the 16th cent., a pedal keyboard has also been incorporated.

Organum. In mediæval music a part sung as an accompaniment below or above the melody or plainsong, usually at the interval of a fourth or fifth; also, loosely, this method of singing in parts.

Ornament. Notes that are added to a given melody by composer or performer as an embellishment.

Overture. Instrumental introduction or prelude to larger work, usually opera. Concert overtures are simply that: *i.e.*, work to be played at start of a concert.

Part. Music of one performer in an ensemble; single strand in a composition.

Part-song. Vocal composition in several parts.

Passacaglia. Composition in which a tune is constantly repeated, usually in the bass.

Passage. Section of a composition.

Passion. Musical setting of the New Testament story of Christ's trial and crucifixion.

Pastiche. Piece deliberately written in another composer's style.

Pavan(e). Moderately paced dance dating from 16th cent. or earlier.

Pedal. Held note in bass of composition.

Pentatonic Scale. Scale of five notes—usually piano's five black keys or other notes in the same relation to each other.

Percussion. Collective title for instruments of the orchestra that are sounded by being struck by hand or stick.

Phrygian Mode. One of the scales of mediæval music, represented by the white keys on piano from E to E.

Piano. Soft, abbr. *p*; *pp* = *pianissimo*, very soft; instrument, invented in 18th cent., having strings struck by hammer, as opposed to the earlier harpsichord where they are plucked. The modern piano has 88 keys and can be either "upright" (vertical) or "grand" (horizontal).

Pianoforte. Almost obsolete full Italian name for the piano.

Pitch. Exact height or depth of a particular musical sound or note.

Pizzicato. Directions for string instrument, that the strings should be plucked rather than bowed.

Plainchant, Plainsong. Mediæval church music consisting of single line of melody without harmony or definite rhythm.

Polka. Dance in 2/4 time originating in 19th cent. Bohemia.

Polonaise. Polish dance in 3/4 time.

Polyphony. Combination of two or more musical lines as in *counterpoint.*

Polytonality. Simultaneous use of several keys.

Postlude. Closing piece, opposite of Prelude.

Prelude. Introductory piece.

Presto. Very fast. *Prestissimo.* Still faster.

Progression. Movement from one chord to next to make musical sense.

Quartet. Work written for four instruments or voices; group to play or sing such a work.

Quaver. Note that equals two semiquavers or half a crotchet.

Quintet. Work written for five instruments or voices; group to play or sing such a work.

Rallentando. Slowing down.

Recapitulation. Section of composition that repeats original material in something like its original form.

Recitative. Term used for declamation in singing written in ordinary notation but allowing rhythmical licence.

Recorder. Woodwind instrument, forerunner of flute.

Reed. Vibrating tongue of woodwind instruments.

Register. Set of organ pipes controlled by a particular stop; used in reference to different ranges of instrument or voice (*e.g.*, chest register).

Relative. Term used to indicate common key signature of a major and minor key.

Répétiteur. Member of opera house's musical staff who coaches singers in their parts.

Rest. Notation of pauses for instrument in composition, having a definite length like a note.

Retrograde. Term used to describe a melody played backwards.

Rhapsody. Work of no definite kind with a degree of romantic content.

Rhythm. Everything concerned with the time of music (*i.e.*, beats, accent, metre, etc.) as opposed to the pitch side.

Ritornello. Passage, usually instrumental, that recurs in a piece.

Romance, Romanza. Title for piece of vague song-like character.

Romantic. Term used vaguely to describe music of 19th cent. that has other than purely musical source of inspiration.

Rondo. Form in which one section keeps on recurring.

Rubato. Manner of performing a piece without keeping strictly to time.

Sackbut. Early English name for trombone.

Saxophone. Classified as wind instrument, although made of brass, because it uses a reed.

Scale. Progression of adjoining notes upwards or downwards.

Scherzo. One of two middle movements, usually third, in four-movement sonata form. Displaced minuet in this form at beginning of 19th cent.

Score. Copy of any music written in several parts.

Second. Interval taking two steps in scale, *e.g.*, C to D flat, or to D.

Semibreve. Note that equals two minims or half a breve.

Semiquaver. Note that equals half a quaver.

Semitone. Smallest interval commonly used in Western music.

Septet. Composition for seven instruments or voices.

Sequence. Repetition of phrase at a higher or lower pitch.

Serenade. Usually an evening song or instrumental work.

Seventh. Interval taking seven steps in the scale.

Sextet. Composition for six instruments or voices.

Sharp. Term indicating a raising of pitch by a semitone.

Shawm. Primitive woodwind instrument, forerunner of oboe.

Simple time. Division of music into two or four beats.

Sinfonietta. Small symphony.

Sixth. Interval taking six steps in the scale.

Solo. Piece or part of a piece for one performer playing or singing alone.

Sonata. Term to denote a musical form and a type of composition. In *sonata form* a composition is divided into exposition, development and recapitulation. A *sonata* is a piece, usually, for one or more players following that form.

Song. Any short vocal composition.

Soprano. Highest female voice.

Sostenuto. Sustained, broadly.

Sotto voce. Whispered, scarcely audible, applied to vocal as well as instrumental music.

Sprechgesang. (Ger. Speech-song.) Vocal utterance somewhere between speech and song.

Staccato. Perform music in short, detached manner.

Staff. Horizontal lines on which music is usually written.

Stop. Lever by which organ registration can be altered.

String(s). Strands of gut or metal set in vibration to produce musical sounds on string or keyboard instruments. Plural refers to violins, violas, cellos, and basses of orchestra.

Study. Instrumental piece, usually one used for technical exercise or to display technical skill, but often having artistic merits as well (*e.g.* Chopin's).

Subject(s). Theme or group of notes that forms principal idea or ideas in composition.

Suite. Common name for piece in several movements.

Symphony. Orchestral work of serious purpose usually in four movements, occasionally given name (*e.g.*, Beethoven's " Choral " symphony).

Syncopation. Displacement of musical accent.

Tempo. Pace, speed of music.

Tenor. Highest normal male voice.

Ternary. A piece in three sections is said to be in ternary form. The balance is obtained by repeating the first phrase or section (though it need not be exact or complete) after a second of equal importance.

Tessitura. Compass into which voice or instrument comfortably falls.

Theme. Same as *subject* but can also be used for a whole musical statement as in " theme and variations."

Third. Interval taking three steps in scale.

Time. Rhythmical division of music.

Timpani. *See* Kettledrum.

Toccata. Instrumental piece usually needing rapid, brilliant execution.

Tonality. Key, or feeling for a definite key.

Tone. Quality of musical sound; interval of two semitones.

Tonic Sol-fa. System of musical notation to simplify sight-reading.

Transcribe. Arrange piece for different medium, instrument, or voice than that originally intended.

Transition. Passage that joins two themes of sections of a composition.

Transpose. Perform a piece at different pitch from that originally intended.

Treble. Highest part in vocal composition; high boy's voice.

Triad. A chord consisting of a note with the third and fifth above it, *e.g.*, C–E–G. A common chord is a triad of which the 5th is perfect, e.g., C–E–G or C–E flat–G. Thus major and minor triads are common chords.

Trio. Work written for three instruments or voices; group to play or sing such a work.

Trombone. Brass instrument with slide adjusting length of tube.

Trumpet. Metal instrument of considerable antiquity; modern version has three valves to make it into a chromatic instrument.

Tuba. Deepest-toned brass instrument with three or four valves.

Twelve-note. Technique of composition using full chromatic scale with each note having equal importance. Notes are placed in particular order as the thematic basis of works.

Unison. Two notes sung or played together at same pitch.

Valve. Mechanism, invented in early 19th cent. to add to brass instruments allowing them to play full chromatic scale.

Variation. Varied passage of original theme. Such variations may be closely allied to or depart widely from the theme.

Verismo. Term to describe Italian operas written in " realist " style at the turn of this century.

Vibrato. Rapid fluctuation in pitch of voice or instrument. Exaggerated it is referred to as a " wobble " (of singers) or tremolo.

Viol. String instrument of various sizes in vogue until end of 17th cent.

Viola. Tenor instrument of violin family.

Violin. Musical four-string instrument, played with bow, of violin family, which superseded viol at beginning of 18th cent.

Virginals. English keyboard instrument, similar to harpsichord of 17th and 18th cent.

Vivace. Lively.

Voluntary. Organ piece for church use, but not during service.

Waltz. Dance in triple time, fashionable in 19th cent.

Whole-tone scale. Scale progressing by whole tones. Only two are possible, one beginning on C, the other on C sharp.

Xylophone. Percussion instrument with series of wood bars tuned in a chromatic scale and played with sticks.

Zither. String instrument laid on knees and plucked. Common in Central-European folk music.

III. INDEX TO COMPOSERS

THE WORLD OF SCIENCE

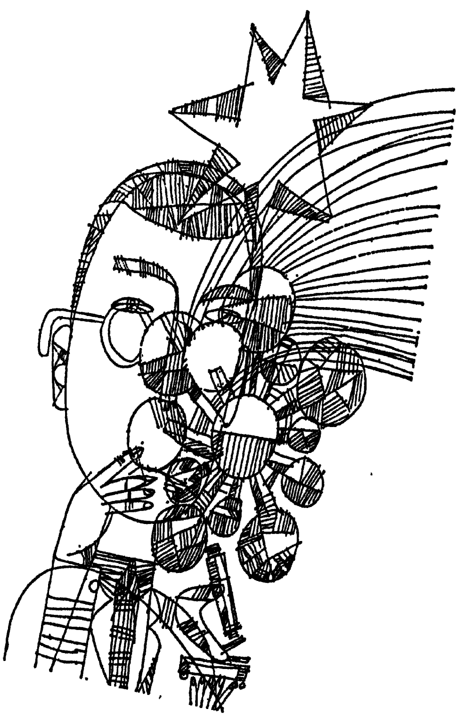

TABLE OF CONTENTS

THE WORLD OF SCIENCE

SCIENCE is not to be confined in laboratories, nor is it exclusively the concern of highly trained specialists. Science has many links, mutually fertile ones, with technology of all kinds, and through technology science changes the aspect of cities, the way of life of peasants, the effectiveness of drugs, the routines of work, the comforts of homes. Science brings knowledge and understanding; indeed it is the most powerful system ever devised for accumulating knowledge and deepening understanding.

Because of its all pervasive social effects, because of the ambiguity of some of its gifts, science presents us with moral choices and therefore enters as an inescapable factor into politics and the arts. Nevertheless, for some scientists, understanding alone would be a sufficient prize to justify their patient studies and it is in this spirit that, in the following pages, a number of scientists have tried to explain in simple language how the universe appears to them at this time.

In Part I the inanimate universe is described. This is the domain of cosmology, astronomy, geology, physics, and chemistry. There are already many interesting links which join this realm to that of the living and make it difficult to say where the boundary lies. Nevertheless it is still convenient to accord to the biological and social sciences two separate chapters, Parts II and III. In Part IV our intention is to give some short accounts of recent developments in both science and technology. They are contributed by scientists actively engaged in these, their own special fields.

I. THE STRUCTURE AND ORIGIN OF THE UNIVERSE

The universe includes everything from the smallest sub-atomic particle to the mightiest system of stars. The scientific view of the universe (not the only view but the one we are concerned with here) is a remarkable achievement of the human mind, and it is worth considering at the outset what a "scientific view" is, and what is remarkable about it.

A scientific view of something is always an intimate mixture of theories and observed facts, and not an inert mixture but a seething and growing one. The theories are broad general ideas together with arguments based on them. The arguments are designed to show that, if the general ideas are accepted, then this, that, or the other thing ought to be observed. If this, that, or the other actually are observed, then the theory is a good one; if not, then the theoreticians have to think again. Thus theoretical ideas and arguments are continually subjected to the severe test of comparison with the facts, and scientists are proud of the rigour with which this is done. On the other hand, theories often suggest new things to look for, *i.e.*, theories lead to predictions. These predictions are frequently successful, and scientists are entitled to be proud of that too. But it follows that no theory is immutable; any scientific view of any subject may, in principle, be invalidated at any time by the discovery of new facts, though some theories are so soundly based that overthrow does not seem imminent.

A remarkable aspect of the scientific view of the universe is that same principles are supposed to operate throughout the whole vastness of space. Thus the matter and radiation in stars are not different from the matter and radiation on earth, and their laws of behaviour are the same. Therefore theories hard won by studies in terrestrial physics and chemistry laboratories are applied at once to the whole cosmos. Astronomy and cosmology are spectacular extensions of ordinary mechanics and physics.

LOOKING AT THE UNIVERSE.

The universe is observable because signals from it reach us and some manage to penetrate our atmosphere.

First, there are waves of visible light together with invisible rays of somewhat longer (infra-red) and somewhat shorter (ultra-violet) wavelengths. These waves show us the bright astronomical objects and, to make use of them, astronomers have constructed telescopes of great power and precision backed up with cameras, spectroscopes, and numerous auxiliaries. The most powerful telescope, at Mt. Palomar, California, has a 200-in.-diameter mirror. The next major advance in optical telescope performance probably awaits the erection of telescopes on satellites outside the earth's atmosphere, which at present acts as a distorting and only partially transparent curtain.

Secondly, there are radio waves of much longer wavelength than light. These can be detected by sensitive radio receivers with special aerial systems. These are the radio telescopes. The most well known British one is at Jodrell Bank and it started working in 1957.

Other types of radiation from outer space impinge on the atmosphere. Cosmic radiation consists of very fast-moving fundamental particles, including protons (F14). Cosmic rays are detected by Geiger counters, by the minute tracks they leave on photographic plates, and by other means. The origin of cosmic rays is still uncertain, but many people think they must have an intimate connection with the nature and evolution of the universe itself.

X-rays and neutrinos (F14) from outer space can also be detected, the former especially by satellite-borne detectors and the latter by apparatus buried in deep mines. X-ray astronomy and neutrino astronomy are being born.

By interpreting the signals that reach us by these various routes, astronomers have formed a remarkably detailed picture of its structure. The merest outline of this will now be given.

Great Distances and Large Numbers.—Let us start with nearby objects. This raises at once the question of what "nearness" and "distance" are in astronomy and how they are to be expressed. A convenient unit of distance is the *light-year*, *i.e.*, the distance that light, travelling at 186,000 miles per second, traverses in one year. Since vast numbers as well as vast distances will enter the question, we need a shorthand for large numbers. Ten times ten times ten will be represented by 10^3; six tens multiplied together (*i.e.*, one million) will be written 10^6, and so on. 10^{14} would mean a hundred million million. One divided by a million (*i.e.*, one-millionth) will be written 10^{-6}; the very small number obtained by dividing one by the product of fourteen tens will be written 10^{-14}. A light-year is $5{\cdot}88 \times 10^{12}$ miles; the radius of an atom is about 10^{-8} cm.

The Solar System.—The earth is the third, counting outwards, of nine planets revolving in nearly circular orbits round the sun. Their names and some other particulars are given in the table (F7). The sun and its planets are the main bodies of the solar system. Between Mars and Jupiter revolve numerous chunks of rock called the asteroids; the largest of these, Ceres, is 480 miles across. Apart from these, the solar system is tenuously populated with gas, dust, and small particles of stone and iron. Dust continuously settles on the earth, and frequently small fragments enter the atmosphere, glow, and evaporate; these are meteors or shooting stars. Sometimes larger rocks, called meteorites, hit the earth. Comets are relatively compact swarms of particles—containing ice according to one theory—which travel in elongated orbits round the sun. Their spectacular tails form under the sun's influence when they approach it. Not all comets stay indefinitely in the solar system; some visit us and go off into space for ever.

The sun itself is a dense, roughly spherical mass of glowing matter, 865,000 miles across. Its heat is so intense that the atoms are split into separated electrons and nuclei (*see* F10) and matter in such a state is called plasma. At the sun's centre the temperature has the unimaginable value of about 13 million degrees Centigrade (a coal fire is about 800° C.). Under such conditions the atomic nuclei frequently collide with one another at great speeds and reactions occur between them. The sun consists largely of hydrogen and, in the very hot plasma, the nuclei of hydrogen atoms interact by a series of reactions whose net result is to turn hydrogen into helium. This is a process which releases energy just as burning does, only these nuclear processes are incomparably more energetic than ordinary burning. In fact, the energy released is great enough to be the source of all the light and heat which the sun has been pouring into space for thousands of millions of years.

Emerging from the sun and streaming past the earth is a "solar wind" of fast-moving electrons and protons (*see* F10) whose motion is closely linked with the behaviour of an extensive magnetic field based on the sun. In fact, the region round the sun and extending far into space past the earth is full of complex, fluctuating particle streams and magnetic fields which interact with planetary atmospheres causing, among other things, auroras and magnetic storms.

Stars.—In colour, brightness, age, and size the sun is typical of vast numbers of other stars. Only from the human point of view is there anything special about the sun—it is near enough to give us life. Even the possession of a system of revolving planets is not, according to some modern views, very unusual.

No star can radiate energy at the rate the sun does without undergoing internal changes in the course of time. Consequently stars evolve and old processes in them give rise to new. The exact nature of stellar evolution—so far as it is at present understood—would be too complex to describe here in any detail. It involves expansion and contraction, changes of temperature, changes of colour, and changes in chemical composition as the nuclear processes gradually generate new chemical elements by reactions such as the conversion of hydrogen to helium, helium to neon, neon to magnesium, and so on. The speed of evolution changes from time to time, but is in any case very slow compared with the pace of terrestrial life; nothing very dramatic may occur for hundreds of millions of years. Evidence for the various phases of evolution is therefore obtained by studying many stars, each at a different stage of its life. Thus astronomers recognise many types with charmingly descriptive names, such as blue giants, sub-giants, red and white dwarfs, supergiants.

The path of stellar evolution may be marked by various explosive events. One of these, which occurs in sufficiently large stars, is an enormous explosion in which a substantial amount of the star is blown away into space in the form of high-speed streams of gas. For about a fortnight, such an exploding star will radiate energy 200 million times as fast as the sun. Japanese and Chinese (but not Western) astronomers recorded such an occurrence in A.D. 1054, and the exploding gases, now called the Crab nebula, can still be seen in powerful telescopes and form a cloud six or seven light-years across. While it lasts, the explosion shows up as an abnormally bright star and is called a *supernova*.

Groups of Stars.—It is not surprising that ancient peoples saw pictures in the sky. The constellations, however, are not physically connected groups of stars but just happen to be patterns visible from earth. A conspicuous exception to this is the Milky Way, which a telescope resolves into many millions of separate stars. If we could view the Milky Way from a vast distance and see it as a whole we should observe a rather flat wheel of stars with spiral arms something like the sparks of a rotating Catherine wheel. This system of stars is physically connected by gravitational forces and moves through space as a whole; it is called a *galaxy*.

The galaxy is about 10^5 light-years across and contains roughly 10^{11} stars. An inconspicuous one of these stars near the edge of the wheel is our sun; the prominent stars in our night sky are members of the galaxy that happen to be rather near us. Sirius, the brightest, is only 8·6 light-years away, a trivial distance, astronomically speaking.

The galaxy does not contain stars only, there are also clouds of gas and dust, particularly in the plane of the galaxy. Much of the gas is hydrogen, and its detection is difficult. However, gaseous hydrogen gives out radio waves with a wavelength of 21 cm. Radio telescopes are just the instruments to receive these, and workers in Holland, America, and Australia detected the gas clouds by this means. In 1952 they found that the hydrogen clouds lie in the spiral arms of the galaxy, and this is some of the strongest evidence for the spiral form.

Another important feature of the galactic scene is the weak but enormously extensive magnetic field. This is believed to have an intimate connection with the spiral structure.

Around the spiral arms, and forming part of the galaxy, are numerous globular clusters of stars. These are roughly spherical, abnormally densely packed, collections of stars with many thousands of members. Because of its form and density, a globular cluster may be assumed to have been formed in one process, not star by star. Thus all its stars are the same age. This is of great interest to astronomers, because they can study differences between stars of similar age but different sizes.

Galaxies.—One might be forgiven for assuming that such a vast system as the galaxy is in fact the universe; but this is not so. In the constellation of Andromeda is a famous object which, on close examination, turns out to be another galaxy of size and structure similar to our own. Its distance is given in the table (F7). The Milky Way, the Andromeda Nebula, and a few other smaller galaxies form a cluster of galaxies called the Local Group. Obviously it would not be so named except to distinguish it from other distinct groups, and it is indeed a fact that the universe is populated with *groups*, or *clusters*, of *galaxies*. A cluster may contain two or three galaxies, but some contain thousands. So far as the eye of the telescope and camera can see, there are clusters of galaxies.

On a photograph a galaxy is a nebulous blob without the hard outline that a single star produces. Such nebulæ were formerly thought to be inside the Milky Way, but, after controversy, it was established that many of them were separate distant galaxies. By about 1920 it was known that there were at least half a million galaxies, and with the advent of the 100-in. Mt. Wilson telescope this number rose to 10^8 and is being increased further by the 200-in. telescope which can see out to a distance of 7×10^9 light-years. Through the powerful telescopes the nearer galaxies reveal their inner structures. Photographs of galaxies are among the most beautiful and fascinating photographs ever taken, and readers who have never seen one should hasten to the nearest illustrated astronomy book. Recent careful co-operation between optical and radio-

astronomers has revealed that some very remote galaxies are strong sources of radio waves. Sometimes these radio galaxies have unusual structures suggestive of violent disturbance.

The Expanding Universe.—Two discoveries about galaxies are of the utmost importance. One is that, by and large, clusters of galaxies are uniformly distributed through the universe. The other is that the distant galaxies are receding from us.

How is this known? Many readers may be familiar with the Doppler effect first discovered in 1842. Suppose a stationary body emits waves of any kind and we measure their wavelength, finding it to be L ins. Now suppose the body approaches us; the waves are thereby crowded together in the intervening space and the wavelength appears less than L; if the body recedes the wavelength appears greater than L. The Austrian physicist, J. Doppler (1803–53), discovered this behaviour in sound waves, and it explains the well-known change of pitch of a train whistle as it approaches and passes us. The same principle applies to the light. Every atom emits light of definite wavelengths which appear in a spectroscope as a series of coloured lines—a different series for each atom. If the atom is in a receding body all the lines have slightly longer wavelengths than usual, and the amount of the change depends uniquely on the speed. Longer wavelengths mean that the light is redder than usual, so that a light from a receding body shows what is called a "red shift." The speed of recession can be calculated from the amount of red shift.

It was the American astronomer, V. M. Slipher, who first showed (in 1914) that some galaxies emitted light with a red shift. In the 1920s and 1930s the famous astronomer E. Hubble (1889–1953) measured both the distances and red shift of many galaxies and proved what is now known as Hubble's Law. This states that the speed of recession of galaxies is proportional to their distance from us. This does not apply to our neighbours in the Local Group, we and they are keeping together. Hubble's Law has been tested and found to hold for the farthest detectable galaxies; they are about 7×10^9 light-years away and are receding with a speed $\frac{2}{3}$ of that of light.

Does this mean that the Local Group is the centre of the universe and that everything else is rushing away from us? No; Hubble's Law would appear just the same from any other cluster of galaxies. Imagine you are in a square on some fabulous chess board which is steadily doubling its size every hour; all other squares double their distances from you in an hour. Therefore the farther squares from you must travel faster than the nearer ones; in fact, Hubble's Law must be obeyed. But anyone standing in any other square would get the same impression.

This extraordinary behaviour of the universe is one of the most exciting discoveries of science. Let us envisage one possible implication. If the galaxies have always been receding, then in the past they must have been closer together. Following this to its conclusion, it seems that all the matter in the universe must have been packed densely together about 10^{10} years ago. Was this really so? The lack of any definite answer to this question is one of the things that makes cosmology so interesting.

Quasi-stellar Objects.—In November 1962 Australian radio-astronomers located a strong radio emitter with sufficient precision for the Mt. Palomar optical astronomers to identify it on photographs and examine the nature of its light. The red shift was so great that the object must be exceedingly distant; on the other hand it looked star-like, much smaller than a galaxy. By the beginning of 1967 over a hundred of these objects had been discovered and other characteristics established, such as strong ultra-violet radiation and inconstancy, in some cases, of the rate at which radiation is emitted. Not all the quasi-stellar objects are strong radio emitters; some show all the other characteristics except radio emission. It has been estimated that the "quiet" kind are about a hundred times more numerous than the radio kind. One great problem here is: how can such relatively small objects generate such inconceivably great amounts of energy that they appear bright at such huge distances? So far this is unanswered; these quasi-stellar objects are a great mystery, though they are generally held to be an important pointer towards a deeper understanding of cosmology.

It is not absolutely certain that the quasi-stellar objects are very distant. Their large red shifts might indicate that they have very large recession velocities while being quite close to our galaxy. But then one would have to explain why they are all going *away* from us, *i.e.*, why there are none (so far) that show a blue shift.

THE ORIGIN OF THE UNIVERSE.

Errors of observation and interpretation occur of course. But there are many checks and repetitions made, so that, on the whole, the descriptive account of the universe would be generally agreed among astronomers. When it comes to inventing theoretical explanations, however, science is on less sure ground, and indeed the theory of the universe is an arena of controversy at present. In most other sciences experiments can be repeated and the same phenomena observed under differing but controlled conditions. This is very helpful. But, by definition, there is only one universe; one cannot repeat it or do experiments with it. On the other hand, it must be remembered that the light from distant galaxies has taken perhaps 10^9 years to reach us, so it tells us what the galaxies were like that number of years ago. Therefore we are not confined simply to describing the present state of the universe; by looking farther into space we are looking farther into the past as well. How, then, does the state of the universe vary with time?

Evolutionary Theories.—One answer to this can be obtained from Einstein's general theory of relativity. Some slight indication of what this theory is about is given on page F15, and its logical development is, of course, a matter for mathematical specialists. It turns out that, if we ume that matter is distributed uniformly throughout space (as observation strongly suggests), then the solutions of Einstein's equations show how the state of the universe may vary with time. Unfortunately there are many possible solutions corresponding to expanding, static, or contracting universes. As we have already seen, the actual universe is expanding, therefore the static and contracting solutions can be ruled out. There is still a multiplicity of expanding possibilities: some correspond to indefinite expansion from an initially very dense state, others to expansion followed by contraction to a dense state followed by expansion and so on repeatedly, *i.e.*, a *pulsating* universe. The "dense state" is presumably to be identified with the time when the receding galaxies were all concentrated near one another, possibly in some dense conglomeration of atoms. This initial state is thought by some to be the origin of the universe; they would say it has been expanding and evolving ever since. If the universe is pulsating, then sooner or later, gravitational attractions between galaxies will slow the observed recession down and turn it into a mutual approach and so back to the dense state. A straightforward application of the mathematics makes this dense state *infinitely* dense, and presumably something must happen before this inconceivable situation arises. For example, forces between atomic nuclei may play an important part and determine what the dense state (if any) is actually like.

The Steady-State Theory.—A rival theory was proposed in 1948 by Bondi, Gold, and Hoyle. They suggested that the universe is not changing with time; there was no initial dense state and no pulsations; the universe always has been, and always will be, like it is now. This does not mean that no local changes can be observed—this would clearly be contrary to the facts. But it does mean that, on the large scale, the clusters of galaxies have a distribution which is uniform in space and unchanging in time. If the numbers of clusters of galaxies in a large volume of space were

counted every few thousand million years the answer would always be the same.

At first sight this appears to contradict outright the observed expansion of the universe. For if the galaxies are receding from one another how can the number in a given volume remain constant? The situation is saved by a bold proposal. It is that matter, in the form of hydrogen atoms, is being *continuously created* throughout space. This gas accumulates in due course into new galaxies, so that as the old ones move apart the young ones appear to keep the numbers up. The necessary amount of continuous creation can be calculated and is equivalent to the appearance of one atom in an average-sized room every 20 million years. If this seems absurdly small, try calculating the rate of creation in tons per second in a sphere of radius 10^9 light-years.

The rate of creation is, however, much too small to have affected any of the laws of ordinary physics. The famous law of the conservation of matter ("matter can neither be created nor destroyed") is violated, but on such a small scale that physicists, it is said, should not complain. Nevertheless, some do complain and see in this violation a strong point against this theory.

The Formation of Galaxies and Stars.—On any theory of the universe, some explanation has to be found for the existence of clusters of galaxies. In all theories galaxies condense out from dispersed masses of gas, principally hydrogen.

Once a huge gas cloud becomes sufficiently condensed to be separately identifiable as a galaxy, further condensation goes on inside it. It is believed on theoretical grounds that it could not condense into one enormous star but must form many fragments which shrink separately into clusters of stars. In these clusters many stars, perhaps hundreds or thousands or even millions, are born at once. A small cluster, visible to the naked eye, is the Pleaides. The Orion nebula, visible as a hazy blob of glowing gas in the sword of Orion, is the scene of much star-forming activity at present.

According to the evolutionary theory, the "initial dense state" consisted of very hot plasma in a state of overall expansion. The expanding plasma was both cooling and swirling about. The random swirling produces irregularities in the distribution of the hot gas—here it would be rather denser, there rather less dense. If a sufficiently large mass of denser gas happened to occur, then the gravitational attraction between its own particles would hold it together and maintain its permanent identity, even though the rest of the gas continued to swirl and expand. Such a large mass would gradually condense into fragments to become galaxies, the whole mass turning into a cluster of galaxies.

The steady-state view is interestingly and significantly different, for, on this theory, galaxies have always been present, and the problem is one of finding how existing galaxies can generate new ones out of the hydrogen gas which is supposed to be continuously created everywhere. Moreover, this has to be done at just the right rate to maintain the galactic population density constant—otherwise it would not be a *steady-state* theory.

A theoretical proposal allowing for galaxy creation was in fact provided by steady-state cosmologists but will not be outlined here because it now seems that the steady-state theory is losing ground.

The Changing Scene.—The 1960s are seeing revolutionary developments in both observational and theoretical astronomy. By 1966 the attractive simplicity of the original steady-state theory had been obscured by modifications forced upon its protagonists by new evidence or theoretical objections. It is an interesting and significant fact that the apparent demise of the steady-state theory has resulted from a welcome injection into cosmology of the characteristic activity of the other sciences, namely, the comparison of theory with observation. For example, it now seems agreed after some years of uncertainty that remote sources of radio waves are the more abundant the weaker their intensity. This strongly suggests that they are more abundant at greater distances. Thus the universe is not *uniform* as the original steady state theory prescribed. Since greater distances correspond to earlier times, any extra abundance of objects observed at the greater distance means that the universe was denser in its younger days than now. This favours an evolutionary theory of the universe.

The same theory requires that the initial dense state of the universe—aptly christened "the primaeval fireball"—should contain intense electromagnetic radiation with a distribution of wavelengths characteristic of the high temperature. As the fireball, *i.e.*, the universe, expanded over a period of about 10^{10} years it cooled, and one feature of this process is that the wavelengths of the radiation increase and their distribution becomes characteristic of a much lower temperature. In fact, the wavelengths should now be concentrated round about 1 mm to 1 cm. (corresponding to about $-270°$ C) and the radiation should approach the earth uniformly from all directions. Radiation just like this has recently been detected in several laboratories, first by Penzias and Wilson in America during 1965. They used very sensitive radio receivers originally designed to detect signals from artificial satellites. No plausible terrestrial or galactic origin for the radiation has yet been conceived; the waves appear to have something to do with the universe itself. Neither is there a rational basis for the radiation within the steady-state theory which probably receives here its *coup de grâce*. The evolutionary theory survives so far.

The Formation of the Chemical Elements.—A stable nucleus is one that lasts indefinitely because it is not radioactive. There are 274 known kinds of stable atomic nuclei and little likelihood of any more being found. These nuclei are the isotopes (*see* F10) of 81 different chemical elements; the other elements, including, for example, uranium and radium are always radioactive. Some elements are rare, others abundant. The most common ones on earth are oxygen, silicon, aluminium, and iron. However, the earth is rather atypical. It is especially deficient in hydrogen, because the gravitational attraction of our small planet was not strong enough to prevent this very light gas from escaping into space.

It is possible to examine the chemical constituents of meteorites and to infer the composition of the sun and other stars from the spectrum of the light they emit. By such means, the conclusion has been reached that 93% of the atoms in our galaxy are hydrogen, 7% are helium; all the other elements together account for about one in a thousand atoms. A glance at the Table of Elements on page N34 will show that hydrogen and helium are two of the lightest elements; they are in fact the two simplest.

According to the steady-state theory, hydrogen atoms are constantly being created. The evolutionary theory supposes that the dense initial state was a system of very hot protons and electrons, *i.e.*, split-up hydrogen atoms. In either case, therefore, the problem is to explain how the heavier chemical elements appear in the universe at all. It is here that a fascinating combination of astronomy and nuclear physics is required.

We have already referred to the fact that the energy radiated from the sun originates in nuclear reactions which turn hydrogen into helium. Why is energy given out? To answer this question we note that nuclei are made up of protons and neutrons (*see* F10). These particles attract one another strongly—that is why a nucleus holds together. To separate the particles, energy would have to be supplied to overcome the attractive forces. This amount of energy is called *binding energy* and is a definite quantity for every kind of nucleus. Conversely, when the particles are brought together to form a nucleus the binding energy is *released* in the form of radiations and heat. Different nuclei consist of different numbers of particles, therefore the relevant quantity to consider is the *binding energy per particle*. Let us call this B. Then if elements of *high* B are formed out of those of *low* B there is a *release* of energy.

Now B is small (relatively) for light elements

like lithium, helium, and carbon; it rises to a maximum for elements of middling atomic weight like iron; it falls again for really heavy elements like lead, bismuth, and uranium. Consequently, energy is released by forming middleweight elements either by splitting up heavy nuclei ("nuclear fission") or by joining up light ones ("nuclear fusion").

It is the latter process, fusion, that is going on in stars. The fusion processes can be studied in physics laboratories by using large accelerating machines to hurl nuclei at one another to make them coalesce. In stars the necessary high velocity of impact occurs because the plasma is so hot. Gradually the hydrogen is turned into helium, and helium into heavier and heavier elements. This supplies the energy that the stars radiate and simultaneously generates the chemical elements.

The very heavy elements present a problem. To form them from middleweight elements, energy has to be *supplied*. Since there is plenty of energy inside a star, a certain small number of heavy nuclei will indeed form, but they will continually undergo fission again under the prevailing intense conditions. How do they ever get away to form cool ordinary elements, like lead and bismuth, in the earth? One view links them with the highly explosive supernovæ, to which we have already referred (**F4** (**2**)). If the heavy elements occur in these stars the force of the explosion disperses them into cool outer space before they have time to undergo the fission that would otherwise have been their fate. The heavy elements are thus seen as the dust and debris of stellar catastrophes. This view is in line with the steady-state theory, because supernovæ are always occurring and keeping up the supply of heavy elements. In the evolutionary theory some of the generation of elements is supposed to go on in the very early stages of the initial dense state and to continue in the stars that evolve in the fullness of time. It cannot be claimed that the origin of the chemical elements is completely known, but we have said enough to show that there are plausible theories. Time and more facts will choose between them.

The Formation of the Planets.—Did the sun collect its family of planets one by one as a result of chance encounters in the depths of space? Or was the solar system formed all at once in some generative process? To this fundamental question at least there is a fairly definite answer. The planetary orbits all lie in about the same plane and the planets all revolve the same way round the sun. This could hardly have happened by chance: indeed, it provides almost conclusive evidence for the alternative view. But what was the generative process?

Many ideas have been proposed, and the problem is very intricate. One view is that the sun and its planets formed in a stellar condensation, a feature of which was the pushing outwards from the central sun of a disc of matter which subsequently became the planets. Such a process would be regarded as normal in stars, and not exceptional.

On the other hand, the planets have been attributed to the effect of a passing star whose gravitational attraction drew out from the sun a jet of gaseous matter which condensed into the planets. Such an encounter between stars is very rare and, on this theory, the formation of planets must be an outside chance. This theory is not widely held now.

The connection between stellar and planetary theory is brought out again by the existence on the planets of the heavier chemical elements. How did they get there? If it be true that heavy elements are hurled into space by exploding supernovæ (see above), then at least one such explosion must have mingled its products with the widespread interstellar hydrogen before the planets condensed. At one time Hoyle put forward the view that the sun was once accompanied by another star (there are many such binary systems known to astronomers) and that the sun's partner exploded. Some of the ejected gases, captured by the sun's gravitational attraction, later condensed into planets, while the remnant of the star recoiled from the explosion and got away into space. This explanation was later modified in that the exploding star and the sun need not be a close pair but merely two of a cluster of stars formed at the same time.

Before leaving this subject, where theories are more numerous than firm conclusions, one more question may be raised: was the earth formed hot or cold? There are adherents to both opinions. One side would say that the planets condensed from hot gases, became liquid, and subsequently cooled and solidified, at the surface if not throughout. Others would say that dust, ice, and small particles formed in space first and subsequently accumulated into large bodies, whose temperature rose somewhat later on. With space exploration beginning in earnest, considerable future progress in understanding planetary formation can be anticipated. (*See also* **Section L: Mars, Venus, Planets.**)

THE SOLAR SYSTEM.

Name.	Distance from Sun (millions of miles).	Diameter (thousands of miles).	Average density (water = 1).	Number of Satellites.
Sun	—	865	1·41	—
Mercury . . .	36	3·1	3·73	0
Venus	67	7·6	5·21	0
Earth	93	7·9	5·52	1
Mars	142	4·2	3·94	2
Jupiter . . .	484	85·0	1·34	12
Saturn . . .	887	70·0	0·69	9
Uranus . . .	1785	30·9	1·36	5
Neptune . . .	2797	33·0	1·32	2
Pluto	3670	?	?	0

SOME ASTRONOMICAL DISTANCES.

(1 light-year = $5{\cdot}88 \times 10^{12}$ miles).

Object.	Distance from Earth (light-years).	Velocity of recession (miles per second).	Object.	Distance from Earth (light-years).	Velocity of recession (miles per second).

Magellanic clouds (the nearest galaxies) .	$1{\cdot}6 \times 10^{5}$	—	Very remote quasi-stellar object . .	$\sim 1{\cdot}5 \times 10^{10}$	~150,000

THE EARTH.

Shape and Size.—The earth has the form of a slightly flattened sphere, the polar radius being 6,357 km. (3,950·4 miles) and the equatorial radius 6,378 km. (3,963·5 miles). Its mass is $5{\cdot}97 \times 10^{27}$ gm. and its volume is $1{\cdot}083 \times 10^{27}$ c.c.; hence its average density is about 5·5 grams per cubic centimetre. This is about twice the average density of the surface material, so it is inferred that there exists a large volume of high density material within the earth.

Structure.—From a study of the passage of earthquake waves through the earth and observations of such properties as magnetism, moment of inertia, temperature increase with depth, etc. it is deduced that the earth has a structure consisting of a series of shells. The central *core* has a radius of some 3,600 km. (2,250 miles); it is probably in part liquid, and is almost certainly composed of an alloy of nickel and iron. Separated from the core by a fairly sharp boundary is the *mantle*: this has a thickness of about 2,800 km. (1,750 miles) and is solid. It is probably composed of silicates of iron and magnesium with some metallic iron in the inner region. The outer 100 km. (62·5 miles) is the *crust*, which is solid under ordinary conditions but which may partially liquefy during periods of igneous activity. Under the continents it is possible to distinguish two layers in the crust: an upper, less dense one, probably granitic in character, known as the sial, and a lower, denser one, the sima, probably basaltic in character. The sial appears to be absent under the Pacific Ocean and very thin or absent under the Atlantic and Indian Oceans. The concept of the sial blocks "floating" in the sima provides an explanation for the observed vertical movements of continents and leads to the theory that they may have "drifted" to their present positions. The junction between the sima and the mantle is quite sharp, the break being known as the Mohorovičić Discontinuity.

Composition.—Direct observation of the crust is confined to the surface and mines or boreholes, the deepest of which reach only to about 5 miles. From analyses of the crustal rocks, the abundance of the elements in the crust can be estimated. The commonest is oxygen (46·6%), followed by silicon (27·7%), aluminium (8·13%) and iron (5%). The next four are calcium, sodium, potassium, and magnesium, ranging between 3·6 and 2%. These 8 elements total 97·57% of the whole crust. Most of the other 84 elements are present in amounts to be measured in parts per million: *e.g.*, copper occurs to the extent of 45 p.p.m., tin, 3 p.p.m. These are average proportions over the whole crust; to be workable as ores, concentrations need to be much higher—*e.g.*, both copper and tin ores have to contain a minimum of 1% metal to be economic. Locating the rare occurrences of such concentrations is the job of the prospecting geologist. Taking the earth as a whole, *i.e.*, core, mantle and crust, most authorities agree that the commonest element is iron, followed by oxygen, silicon, and magnesium in that order: after this, there is only partial agreement.

The Age of the Earth.—It is possible to make an estimate of the age of the earth's crust by considering the rate at which radioactive elements break down into inert elements. A number of methods are now available, the most important being those based on the study of the abundances of isotopes of lead and other elements. From the data obtained, estimates can be made of the following points on the time scale: Age of earth's crust about $5{\cdot}3 \times 10^9$ years (as a planet the earth has existed for several thousand million years); life emerged about 2×10^9 years ago; first large-scale occurrence of fossils, 600×10^6 years ago. Other points on the scale are given in the table in Part II (10^9 = thousand million; 10^6 = million).

The Materials of the Earth's Crust.—Geologists recognise three main classes of rocks making up the crust—Igneous, Sedimentary, and Metamorphic. Rocks are aggregates of minerals, which may be regarded as simpler, homogeneous compounds, in contrast to the complex, inhomogenous mixture which is a rock. The bases of rock classification are minerals present, shape and size of the individual grains, and the mode of origin of the material.

Igneous rocks are usually regarded as having crystallised from a molten state, although certain types may have arisen in other ways, *e.g.*, by reaction between high-temperature fluids, of the right composition, and pre-existing rocks. Typical igneous rocks are granite and basalt; granite is coarse-grained, intrusive into other rocks, and contains the minerals quartz, potash or soda felspar, and usually a mica. Basalt is fine-grained, flows out as lava at the surface and contains the minerals augite, calcium felspar, and usually olivine. Between these extreme types are some thousands of intermediates, but together granite and basalt constitute 90–95% of all igneous rocks seen at the surface.

Sedimentary rocks are derived from pre-existing rocks by the processes of weathering and erosion, followed by transport to the point of ultimate deposition of the material, which is then converted from unconsolidated sediment to rock by the process of lithifaction. Typical sedimentary rocks are sandstone, limestone, and shale. Sandstone consists of particles of quartz and occasional other minerals, whereas shales are compacted clays, which may become slate if compressed very strongly during mountain building. Limestones may be chemical precipitates, but are commonly formed by the aggregation of skeletal material of animals. Some other sedimentary types of interest are conglomerates—lithified pebble beds—and evaporites, such as rock salt and gypsum beds. The bulk of the sedimentary rocks were formed under marine conditions.

Metamorphic rocks are produced by the action of heat and/or pressure upon pre-existing rocks, producing considerable changes in mineralogy and texture. Rocks subjected to heat alone are termed hornfelses (marbles if the original rock was a limestone). Pressure alone may produce slates, but often pressure results in shearing forces which crush and break up rocks to a fine powder (subsequently lithified), known as mylonite. Heat and pressure together produce the type of metamorphism known as regional, because it occurs over large areas (*e.g.*, the Scottish Highlands), where it can be seen to have been associated with mountain-building processes. Typical rocks of this kind are schist and gneiss; the former is a foliated rock, usually with much mica, while the latter is a banded rock, with dark and light bands of quartz and/or felspar and mica and/or hornblende. Some gneisses, called migmatites, were produced by the injection of granitic material along the foliation planes of schists.

Mountain Building.—There is no general agreement among geologists about the origin of mountains, despite many years of argument. It is a matter of observation that the great mountain ranges are built of sedimentary rocks—usually much metamorphosed in the deeper levels—and occur in relatively narrow belts of great length. The idea has developed that long, narrow depressions known as *Geosynclines* develop in the crust, into which vast quantities of sediments are poured. The floor is slowly depressed by the weight of material, and ultimately the two sides of the geosyncline move together, folding the sediments both upwards and downwards, producing the complex structures seen in such regions as the Alps and Himalayas. It has been suggested that convection currents in crust, core, or mantle may provide the forces required, but some geologists believe that the earth is contracting and causing the skin to "wrinkle." Another possibility is that the sial blocks move about in the sima, and the Alps, for example, were formed when Africa drove northwards towards Europe. It is suggested that radioactive heating of the sima layers may make them sufficiently mobile to allow movement to take place, and this seems to be an essential feature of most theories of mountain building.

Glaciation.—Within the last million years much of the northern part of the Northern Hemisphere was covered by ice-sheets, now reduced to the Arctic ice-cap. This has profoundly modified the landscape, especially in mountainous regions such as the Alps, North Wales, and the Scottish Highlands. The ice, moving first as valley glaciers and later as sheets over wide areas, scraped off all loose surface material, which was then available to abrade the bare rocks to give the characteristic scenery. In Britain the maximum advance of the ice-sheets brought them to the line Bristol Channel–Thames Estuary, passing just north of London. The great heaps of débris transported by the glaciers are known as moraines. The cause of the ice age is not fully understood, but it is worth noting that in the Permo-Carboniferous period in the Southern Hemisphere there was a widespread glaciation at the same time as the coal measures and desert sediments were being laid down in the Northern Hemisphere. Other glaciations are known from several other epochs as far back as 2×10^9 years.

The Oceans.—The oceans cover 75% of the earth's surface. They may be divided into three main types of environment—the *shelf seas*, bordering the continents, the *continental slopes*, transitional between the shelves and the *abyssal region*. Each region has its own type of sedimentation, fauna, and flora. Because of the virtual absence of a sial layer under the oceans, the study of the ocean floor yields special information about the sima and mantle, and may provide data leading to a solution of current problems relating to geosynclines and mountain building. Study of sedimentation in the oceans is important for understanding the ancient sedimentary rocks.

The Atmosphere.—The atmosphere at sea-level contains about 78·1% nitrogen and 21% oxygen, the remainder being carbon dioxide (0·03%) and the inert gases. It is thought that in the early stages of the earth's history much more carbon dioxide existed and less oxygen. When plants developed, the carbon dioxide was utilised in the building up of food substances with the release of oxygen in the process of photosynthesis (F19). *See also* **Air, Atmosphere, Section L.**

The International Geophysical Year, 1957–58.—The results of the IGY observations are still being analysed and discussed in order to exhaust their scientific content. It is certain that almost all the principal investigations in geophysics during the next half century and almost all the advances in our knowledge of the earth and of the forces acting upon it will be based upon the global data accumulated during the IGY. The oceans of the world have been so incompletely studied and present so many problems, many of which could not be investigated during the IGY, that further observations are to continue over a period of years, together with a comprehensive programme of observations in the marine sciences.

THE WORLD OF PHYSICS.

Anyone compelled by curiosity or professional interest to look into contemporary journals of pure physics research is soon struck by the fact that the old text-book division of physics into "heat, light, sound, electricity, and magnetism" has become very blurred. The indispensable periodical of research summaries, *Physics Abstracts*, contains about 3,000 entries a month, under many separate headings. This is very daunting even to the experienced physicist and, as a token of the human effort devoted to one single branch of science, it is impressive for variety, for degree of specialisation, and for sheer volume. How can the main features of this great work be presented to the non-specialist?

Two different, though complementary, sections can be distinguished. First, there is the physics concerned with the properties of matter in bulk, with solids, liquids, and gases, and with those odd but very important substances, such as paints, plastic solutions, and jelly-like material, which are neither properly solid nor liquid. In this vast domain of physics questions like this are asked: Why is iron magnetic, copper not? What happens when solids melt? Why do some liquids flow more easily than others? Why do some things conduct electricity well, others badly, some not at all? During the last century, particularly the last few decades, it has become clear that such questions can be answered only by raising and solving others first. In particular, we must ask: (i) Of what nature are the invisible particles of which matter is composed? and (ii) How are those particles arranged in bulk matter?

The first of these two questions has generated the second major category of modern physics: this is the physics of particles and of the forces that particles exert on each other. In this field, which represents science at its most fundamental, questions like this are asked: If matter is composed of small units or particles, what are they like? How many kinds of particle are there? Do the particles possess mass? electric charge? magnetism? How do the particles influence each other? How can their motion be described and predicted?

Once scientists became convinced that matter did indeed consist of particles, the *arrangement* of the particles in matter became an important question. This is the problem of *structure*. It was discovered, by von Laue in Germany and by W. H. and W. L. Bragg in England, that the structure of solids could be inferred from the way X-rays are reflected. It is well known that X-rays can penetrate solids. In doing so, they encounter successive layers of particles and are reflected from them. The reflections reveal how far apart the layers are and how the particles are arranged in space. This is the technique of X-ray crystallography. By now it has shown that most solid matter is *crystalline*, *i.e.*, it consists of a regular pattern of particles repeated over and over again to fill the volume of the solid—just as a wallpaper is covered by repeated units of design. The units in a crystal are very small, often about 10^{-8} cm. across, and the particles in them are very close together.

Liquids, on the other hand, have no repeated pattern, but consist of particles which are jumbled up, though still very closely packed—like marbles in a bag. In gases, the particles are widely separated and moving rapidly about; the average distance between particles in air is about 10 times that in ordinary solids, and air particles have an average speed of 5×10^4 cm. per sec. (1,000 m.p.h.).

In general, therefore, the structure of matter is fairly well understood. This does not mean that structure studies are out of date, but only that now they are devoted to elucidating the structure of particular substances, often extremely complex ones such as are found in living matter. We shall therefore say no more about structure, but turn to the major divisions of physics introduced above: (i) particles and their forces; (ii) the properties of matter in bulk.

I. PARTICLES AND FORCES.

The idea that matter is composed of small particles, or atoms, originated, it is true, in classical times. Nevertheless, the modern views need be traced back no farther than the beginning of the nineteenth century, when Dalton and his contemporaries were studying the laws of chemical combination. By that time the distinctions between elements, compounds, and mixtures were already made. Compounds and mixtures are substances which can be separated into smaller amounts of chemically distinguishable constituents. Elements (*see* N34) cannot be so divided. In a mixture the components may be mixed in any proportion and sorted out again by non-chemical means. In a compound the elements are combined in fixed proportions by weight. This last fact gives the clue to atomic theory.

Dalton and atomic theory.

Dalton pointed out that the fixed combining weights of elements could easily be explained if

the elements consisted of atoms which combined in simple numerical ratios, *e.g.*, 1 atom of element A with one of B, or one of B with two of C, and so on. For instance, 35·5 gm. of chlorine combine with 23·0 gm. of sodium to make 58·5 gm. of ordinary salt. If we assume one atom of chlorine links with one of sodium, then the atoms themselves must have weights in the ratio 35·5 to 23·0. This turns out to be consistent with the combining weights of chlorine and sodium in all other compounds in which they both take part. Sometimes two elements combine in several different proportions by weight. But this is easily explained by assuming that the atoms link up in different numbers, *e.g.*, one iron atom with one oxygen, or two irons with three oxygens, or three irons with four oxygens. Then the three different combining proportions arise from the three different numbers of atoms, *using in each case the same ratio of oxygen atom weight to iron atom weight.*

Atomic weight.

Over the century and a half since Dalton, these ideas have been repeatedly tested by chemical experiments. No one now doubts that every chemical element has atoms of characteristic weight. By convention the number 12·0000 is ascribed to carbon and called its "atomic weight." The atomic weights of other atoms are expressed by giving their ratio to that of carbon, *e.g.*, hydrogen, 1·008; iron, 55·85. These numbers are only ratios; the real weight of one single oxygen atom is $2{\cdot}7 \times 10^{-23}$ gm.

J. J. Thomson and the electron.

Matter is electrically uncharged in its normal state, but there exist many well-known ways of producing electric charges and currents—rubbing amber, or rotating dynamos, for example. It is therefore necessary to have some theory of electricity linked to the theory of matter. The fundamental experiment in this field was made by J. J. Thomson when, in 1897, he discovered the electron.

If you take two metal electrodes sealed inside a glass vessel, and if the air is suitably pumped out and a high voltage applied to the electrodes, then the negative one emits a radiation which causes the walls of the tube to glow. The rays are called *cathode rays*. The discovery of the electron was essentially a clarification of the nature of cathode rays. Thomson showed that they were streams of particles with mass and negative electric charge and a general behaviour unlike any other atomic particle known at that time. The importance of this discovery for the world of science cannot be overestimated, and its technical progeny are in every home and factory in radio valves, television tubes, and other devices.

Rutherford–Bohr atom.

Since the electrons emerge from matter, they are presumably parts of atoms. The relation between the negative electrons and the positively charged constituents of matter was elucidated by the great experimenter Rutherford and the great theoretician Bohr. Their work, just before the First World War, showed that the positive charge, together with almost all the mass, is concentrated in the central core or nucleus of the atom about which the very light-weight electrons revolve. The diameter of an atom is about 10^{-8} cm., roughly one-three hundred millionth part of an inch. The central nucleus has a diameter about 10,000 times smaller still. The nucleus and the electrons hold together because of the electric attraction between them.

At this stage work could, and did, go separately along several different lines:

(i) Electrons could be studied on their own. Nowadays the handling of beams of electrons of all sizes and intensities has become major industry.

(ii) The nucleus could be treated as special problem, and this led to the mid-century flowering of nuclear physics, to the atomic bomb, and to nuclear power.

(iii) The behaviour of electrons in the atom could be analysed; this is the great domain of atomic physics which spreads into many other sciences as well.

Volumes have been written about each of these three fields, but we can spare only a few lines for each.

The Electron.

Electrons are expelled from solids by light, heat, electric fields, and other influences. It has therefore been possible to study beams of electrons on their own *in vacuo*. Electrons inside matter, either as constituents, or temporarily in transit, can also be observed by their innumerable effects. These observations all show the particles to be indistinguishable one from another; all electrons are the same wherever they come from. They have a definite mass ($9{\cdot}11 \times 10^{-28}$ gm.), a negative electric charge, a magnetic moment, and a "spin" (intrinsic rotatory motion). No one has ever subdivided an electron or obtained an electric charge smaller than that on one electron. The electronic charge is therefore used as a basic unit of charge in atomic physics. The electron has come to be the best known of all the "fundamental particles."

The Nucleus.

The early research programmes in nuclear physics were greatly facilitated by the occurrence in nature of certain unstable (radioactive) nuclei which emit fast-moving fragments. The latter can be used as projectiles to aim at other nuclei as targets; the resulting impacts yield much valuable information. This technique still dominates nuclear physics, though nowadays the projectiles are artificially accelerated by one or other of the large costly machines designed for the purpose.

The most important early discovery was that the nucleus consists of two types of fundamental particle—the positively charged *proton* and the electrically neutral *neutron*. These two are of nearly equal mass (about 1,800 times that of the electron), and like electrons, have a magnetic moment and spin. The proton charge is equal to the electron charge, though opposite in sign. Consider a moderately complex nucleus like that of iron. This usually has 30 neutrons and 26 protons. Its atomic weight therefore depends on the total number of neutrons plus protons, but the total charge depends only on the number of protons—called the *atomic number*. The latter is denoted by Z while the total number of neutrons plus protons is called *mass number* and denoted by M. A species of nucleus with given values of Z and M is called a *nuclide*. Z is also the number of electrons in the atom, since the atom as a whole is electrically neutral. The atomic number determines the chemical nature of the atom (see below), so that by altering the number of *neutrons* in a nucleus we do not change the chemical species. It is therefore possible to find—and nowadays to make—nuclei of the same element which nevertheless differ slightly in weight because they have different numbers of neutrons. These are called *isotopes*. Iron isotopes are known with 26, 27, 28, 29, 30, 31, 32, and 33 neutrons, but all have 26 protons. Thus a set of isotopes consists of the various nuclides that have the same Z but different M's.

Stable Nuclides.

The protons and neutrons in a nucleus are bound together by strong forces called *nuclear forces*. In many cases, the forces are so strong that no particles ever escape and the nucleus preserves its identity. There are two hundred and seventy-four different combinations of neutrons and protons of this kind, and they are called the *stable nuclides*. The earth is largely composed of such stable nuclides, because any unstable ones have, in the course of time, spontaneously broken up into stable residues.

Nevertheless, there are some unstable nuclei left on earth. They give rise to the phenomenon of radioactivity which was discovered by Becquerel in 1893.

Unstable Nuclides: Radioactivity.

Becquerel found that certain chemicals containing uranium gave off rays capable of blacken-

ing a photographic plate, and shortly afterwards Marie and Pierre Curie discovered more substances, including radium, which produce similar but stronger effects. By now, about fifty chemical elements having radioactive properties are known to exist on earth, some, like radium, being strongly radioactive, others, like potassium, being so weak that the radiations are difficult to detect. These are called the *natural radioactive nuclides*.

The main facts about radioactivity are as follows: it is a *nuclear* phenomenon and (with minor exceptions) proceeds quite independently of whatever the electrons in the atom may be doing. Thus, the radioactivity of an atom is not affected by the chemical combination of the atom with other atoms, nor by ordinary physical influences like temperature and pressure. The radioactivity consists of the emission by the substance of certain kinds of rays. The early workers, Rutherford being the giant among them, distinguished three kinds of rays labelled α, β, and γ. These are described below. Whatever kind of ray is examined, it is found that the radiation from a given sample decreases gradually with time according to a definite law which states that the intensity of radiation decreases by half every T seconds. The number T, called the half-life, is constant for each radioactive material, but varies enormously from substance to substance. For instance, radium decreases its activity by a half every 1,622 years, whereas the half-life of one of the polonium isotopes is about $0{\cdot}3 \times 10^{-6}$ sec.

α-, β-, and γ-rays.

The three most well-known types of radioactive emission are quite distinct from one another.

(i) α-rays or α-particles consist of two protons and two neutrons bound together. They are ejected from the radioactive nucleus with one of several well-defined speeds. These speeds are high, often of the order 10^9 cm. per sec. Two protons and two neutrons are the constituents of the nucleus of helium, and α-particles are thus fast-moving helium nuclei.

(ii) β-rays are moving electrons. They may emerge from their parent nucleus with any speed from zero to a definite maximum. The maximum speed often approaches that of light, and is different for each isotope. The electron has a positively charged counterpart, the positron (see below), and β-rays are sometimes positrons. To distinguish the two cases, the symbols β^- and β^+ are used. The naturally occurring β-radiations are almost all β^-.

(iii) γ-rays travel with the speed of light because they are in fact electromagnetic waves differing from light only in the extreme shortness of their wavelength. They have no electric charge.

It is unusual, though not unheard of, for the same radioactive substance to emit both α- and β-rays. On the other hand, γ-rays frequently accompany either α- or β-rays.

γ-rays pass through matter easily; in fact, they are extra penetrating X-rays. α-rays can be stopped by thin sheets of tissue paper. α-rays brought to rest pick up a pair of electrons from the surrounding matter and become neutral helium atoms, and helium gas from this source is consequently found imprisoned in certain radioactive rocks. β-rays are intermediate in penetrating power between α- and γ-rays.

We must now try to interpret these observations.

Radioactive Disintegration.

A nucleus is a collection of neutrons and protons interacting with each other and possessing collectively a certain amount of energy. Just as some human organisations lose their coherence if they accept too many members, so nuclei can remain stable only if (i) the total number of particles is not too great, and (ii) neutrons and protons are there in suitable proportions. Radioactive nuclei are the ones for which either or both these conditions do not hold. Sooner or later such nuclei eject a fragment, thus getting rid of some energy they cannot contain. This is called a *radioactive disintegration*, and the fragments are the α-, β-, and γ-rays. α-emission relieves a nucleus of two neutrons and two protons and some energy; γ-emission simply carries off excess energy without altering the number or kind of particles left behind. β-emission is more complicated. There are no electrons normally present in a nucleus, but they are suddenly created and explosively emitted if a neutron changes into a proton; positive electrons are similarly generated if a proton changes into a neutron. β-emission is therefore a mechanism for changing the ratio of protons to neutrons without altering the total number of particles.

Both α- and β-emission change the Z of a nucleus, and the product, or daughter nucleus, is a different chemical element. α-emission also changes the M. It might happen that the daughter nucleus is unstable, in which case it too will disintegrate. Successive generations are produced until a stable one is reached. Part of such a family tree is shown below. The symbols above the arrows show the kind of rays emitted at each stage, the figures are the mass numbers, M, and the names and symbols of chemical elements can be found in Section N.

U^{238} - Th^{234} - $Pa^{234} \longrightarrow U^{234}$ - - Th^{230}

Ra^{22} ➤ Rn^{22} - Po^{218} - - Pb^{214} ➤ Bi^{214}

$Po^{214} \longrightarrow Pb^{210} \longrightarrow Bi^{210} \longrightarrow Po^{210} \xrightarrow{\alpha} Pb^{206}$

(Pb^{206} is stable lead).

This family exists naturally on earth, because the head of the family, U^{238}, has so long a half-life ($4{\cdot}5 \times 10^9$ years) that there has not yet been time enough since its formation for it to have disappeared.

Artificial Radioactivity.

Nowadays many new radioactive isotopes can be man-made. All that is required is to alter the M or Z (or both) of a stable isotope to a value which is incompatible with stability. The means for doing this is *bombardment*, *i.e.*, stable nuclei are exposed to the impacts of atomic particles such as streams of protons from an accelerator, the neutrons in an atomic reactor, or simply the α-particles from another radioactive substance. The new material is called an *artificially radioactive isotope*. Artificial radioactivity is not different in kind from that of the naturally radioactive substances, but the half-lives are usually on the short side. Indeed, the isotopes in question would exist in nature but for the fact that their short half-lives ensured their disappearance from the earth long ago.

Suppose a piece of copper is exposed to the intense neutron radiation in an atomic reactor at Harwell.

The more abundant of the two stable isotopes of ordinary copper has thirty-four neutrons and twenty-nine protons (*i.e.*, $Z = 29$, $M = 63$). In the reactor many (not all) of these nuclei absorb a neutron, giving an unstable copper nucleus with $Z = 29$, $M = 64$. When removed from the reactor the specimen is observed to be radioactive with a half-life of 12·8 hours. It is somewhat unusual in that it gives out both β^- and β^+ rays. Some nuclei emit electrons, leaving a daughter nucleus with one more positive charge than copper, *i.e.*, a zinc nucleus ($Z = 30$, $M = 64$). One neutron has become a proton, and the resulting zinc nucleus is stable. The others emit positrons, leaving behind a nucleus in which a proton has been turned into a neutron ($Z = 28$, $M = 64$); this is a stable nickel nucleus. The overall process is one example of the artificial transmutation of the chemical elements which is now a commonplace of nuclear physics. It was first discovered by Irene and Frederick Joliot-Curie in 1934.

Lack of a Complete Theory.

Consider now a collection of, say, one million radioactive nuclei of the same kind. It is impossible to tell exactly when any one of them will disintegrate; it is a matter of chance which ones break up first. All we know is that, after a time equal to the half-life, only a half a million will survive unchanged. In general, the more excess energy a nucleus has, the more likely it is to break

up, and therefore the shorter the half-life of that particular nuclear species. In principle, to calculate the half-life theoretically, one would have to have a reliable theory of nuclear forces and energies. This is still being sought after, so it is probably fair to say that while the laws of behaviour of radioactive isotopes are well and accurately known, the *explanation* of this behaviour in terms of the properties of protons and neutrons is by no means complete.

Nuclear fission—chain reaction.

A discovery important not just for nuclear physics but for the whole of mankind was made by Hahn and Strassman in 1939. This was the discovery of nuclear fission in uranium. One of the natural isotopes of uranium is an unstable one, U^{235}, with 143 neutrons and 92 protons. It normally shows its instability by emitting α- and γ-rays. If uranium is bombarded with neutrons, some U^{235} nuclei temporarily gain an extra neutron, which makes them even less stable. This they show by splitting into two roughly equal parts, called fission fragments, together with two or three neutrons. There are two highly important things about this disintegration. One is that the two or three neutrons can promote further disintegrations in other uranium nuclei, and the process can therefore be self-propagating: it is then called a *chain reaction*. The other is that the total mass of the fission products is less than that of the original nucleus. This mass difference does not disappear without trace: it turns into energy according to a formula referred to in a paragraph below (F15(1)).

Application of these new forces.

The world has found two uses for the energy liberated in nuclear chain reactions: the atomic bomb and nuclear power plants. In the first, conditions are arranged to promote and encourage a tremendous and rapid chain reaction leading to an explosion; in the second, the steady liberation of energy in the form of heat is controlled for use in turbines which can generate electricity or provide propulsion. Both uses represent epoch-making technical achievements, but mankind has yet to show itself capable of bearing sanely the burden of responsibility which nuclear physicists have laid upon it. One thing is certain: the discoveries will not cease. Already, other fissionable elements have been made and used; new chemical elements have been created; nuclear plants ("atomic piles") have stimulated great demands for new materials that will stand the heat and radiation inside the reactor, and this promotes research in other fields of science; irradiation inside an atomic pile gives new and potentially useful properties to old materials; nuclear power drives ships and aircraft. It is difficult to write even briefly about contemporary nuclear physics without feeling keenly the ambiguity of its powerful promises.

Although so much is known about the behaviour of nuclei, the theory of the nucleus leaves much to be desired. What holds the neutrons and protons together? Why are some nuclei more stable than others? It is certain that the forces between neutrons and protons in a nucleus are unlike the electrical attractions between the nucleus as a whole and its surrounding electrons. Nor have they anything to do with gravitation. Indeed, the best description and explanation of nuclear forces is the objective of much of the contemporary research effort in nuclear physics.

Atoms.

A nucleus surrounded by its full complement of electrons is an electrically neutral system called an atom. Neither the atom as a whole, nor its nucleus, counts as a "fundamental particle" because either can be subdivided into more elementary parts, thus:

$$\text{atom} \longrightarrow \text{electrons} + \text{nucleus} \longrightarrow \text{electrons} + \text{neutrons} + \text{protons}$$

The chemical identity of the atoms of a given element, which was Dalton's key idea, depends entirely on the number and motion of the electrons. For example, the simplest element, hydrogen, has one proton for a nucleus, and one electron. The latter is comparatively easily detached or disturbed by the electric forces exerted by neighbouring atoms, consequently hydrogen is reactive chemically, *i.e.*, it readily lends its electron to build chemical structures with other equally co-operative elements. The second element, helium, has a nucleus of two protons and two neutrons; outside are two electrons in a particularly stable arrangement. Indeed, this pair of electrons is so difficult to disarrange that a special name has been coined to cover such cases—*closed shells*. Helium, with its closed shell, will not react chemically with anything. As the nuclear charge increases, different electron arrangements of greater or lesser stability succeed one another, with every so often a closed shell corresponding to one of the chemically inert gases neon, argon, xenon, krypton.

Such considerations, pursued in sufficient detail, enable atomic physics to account for all the differences and similarities among the chemical elements and, in principle at least, for the other facts of chemistry as well.

Ions.

It is possible to remove one or more electrons from an atom, leaving it positively charged. The atom is then said to be *ionised* and is called a *positive ion*. Alternatively, some atoms are capable of accepting electrons above their normal complement, thus becoming negative ions. The behaviour of ions is very important in many fields of physics and chemistry, and some of these will be referred to later.

Molecules.

Electrical attractions of various kinds cause atoms and ions to form compound groups. This is the basis of chemical combination, and the smallest conceivable fragment of compound which still preserves the chemical identity of that compound is called a molecule. Molecules have a wide range of complexity, from simple pairs of atoms to highly intricate spirals and chains composed of thousands of atoms.

Excited atoms.

Like the nuclei described above, atoms can be given excess energy and will then return to their ground state with the emission of radiation. The excess energy usually resides in one of the electrons which is executing unusually violent motion. The electron returns to normal by releasing its excess energy in the form of light whose colour is characteristic of the atom involved. Herein lies the explanation of innumerable natural and technical phenomena, such as the colours of glowing gases whether they exist in the sun and stars, in aurorae, or in street-lamps and neon signs. Herein also lies the reason for the importance of spectroscopy, which is the study of the characteristic radiation from excited atoms; for spectroscopy is not only a useful tool for the chemical identification of elements ("spectroscopic analysis") but was one of the main routes along which twentieth-century physicists broke through to a knowledge of the inner nature of the atom.

Fields and Waves.

Maxwell and electromagnetic waves.

Atoms are held together by the electric attraction of the nucleus for the electrons. Finer details of atomic behaviour depend on the magnetic moments of the particles. Any region of space subject to electric and magnetic influences is called an *electromagnetic field*. Before the discovery of the electron, Maxwell had perfected a general theory of the electromagnetic field, giving to physics a celebrated set of equations which describe satisfactorily almost all electric and magnetic phenomena. *Inter alia*, he proved that disturbances in the electric and magnetic conditions at one place could be propagated to another place through empty space, with a definite velocity, just as sound waves are propagated through air. Such electromagnetic disturbances in transit are called *electromagnetic waves*, and their velocity turned out experimentally to

be the same as that of light and radio waves—which was a decisive argument to show that both of these phenomena are themselves electromagnetic waves.

Einstein and photons.

In the years between about 1900 and 1920 this view was upset by Planck, Einstein, Millikan, and others, who focused attention on phenomena (radiant heat, photoelectricity) in which light behaves like a stream of particles and not at all like waves. A wave and a particle are two quite different things, as anyone will admit after a moment's contemplation of, say, the ripples on a pond and a floating tennis ball. The acute question was: is light like waves or particles? This celebrated dilemma soon multiplied its horns. In 1927 electrons were shown to be quite capable of behaving as waves instead of particles, and this is now known to be true of protons, neutrons, and all other fundamental particles as well.

Theoretical physicists have devised means of having it both ways. To say that light behaves as particles means that the waves of the electromagnetic field cannot have their energy subdivided indefinitely. For waves of a given frequency, there is a certain irreducible quantity of energy that must be involved whenever light interacts with anything. This quantity is the product $h\nu$, where ν is the frequency and h is a constant named after Planck. Each such unit is called a *quantum of the electromagnetic field* or a *photon* and is counted as one of the fundamental particles. Frequencies and wavelengths vary widely: typical wavelengths are: radio—hundreds or thousands of metres; radar—a few centimetres; visible light—5×10^{-5} cm.; X-rays—10^{-8} cm.

It is now accepted that every fundamental particle is a manifestation of the waves of one or other kind of field. Physicists speak of waves, particles, and fields in the same breath or rather the same equation. Little is to be gained by asking if electrons or photons are "really" particles or waves. All one can say is that they are things whose behaviour is predicted and described by certain equations. Those who must visualise can imagine particles in some phenomena and waves in others: neither conception contains the whole truth. Why should the ultimate invisible constituents of matter be forced into one or other category derived from everyday experience? For convenience, however, we shall continue to call these things "fundamental particles."

Quantum Theory.

The point of view of the last paragraph is characteristic of quantum theory, which is the currently accepted fundamental theory of matter and motion. One can reasonably ask at what position in space, exactly, is a particle? Or, what, exactly, is the wavelength of a wave? But the first question cannot be reasonably asked of a wave, nor the second of a particle. Since electrons have something in common with both, one question cannot be answered precisely for electrons without ignoring the other; alternatively, both questions can be given an imprecise answer. As the wavelength of electrons is intimately connected with their speed, one has to accept an accurate knowledge of the speed (wavelength) and ignorance of position, or the converse, or *inaccurate* knowledge of both. This is the famous Heisenberg Uncertainty Principle. Quantum theory is a set of mathematical rules for calculating the behaviour of fundamental particles in accordance with the Uncertainty Principle. In spite of its equivocal-sounding name, the principle has led to an enormous increase in the accuracy with which physical phenomena can be described and predicted. Quantum theory includes all that previous theories did and more.

Quantum theory grew up in the same epoch as the Theory of Relativity. Heroic attempts have been made to combine the two, but with only partial success so far. Relativity is concerned with all motion and all physical laws, but its characteristic manifestations occur only when something is moving with nearly the velocity of light. Quantum theory is likewise all-embracing, but its typical phenomena almost always occur when something on the minute atomic scale is in question. Consequently, the vast majority of everyday mechanics needs no more than the classical theory laid down by Newton, which is neither relativistic nor quantum.

Relativity.

Historically, relativity grew out of attempts to measure the speed with which the earth moved through that hypothetical medium, called the ether, which was supposed at that time to be the bearer of light waves. To take a simple analogy: sound waves travel through still air with a certain definite speed, v. If you move through the air with speed v' towards oncoming sound waves, they will pass you at the speed $v + v'$. Michelson and Morley, in their celebrated experiment of 1887, failed to find the corresponding behaviour on the part of light. This is so important an experiment that it has been repeated, and repeatedly discussed, ever since. In October 1958 the latest and most accurate confirmation of the Michelson–Morley result was announced. It seems as if light always travels with the same speed relative to an observer, however fast he moves relative to anything else. Einstein put it this way: two observers moving with any constant velocity relative to each other will always agree that light travels past them at the same speed; this speed is denoted by c, and is approximately 186,000 miles per second.

This postulate, logically developed, leads to remarkable conclusions. For instance: if you walk from tail to nose of an aircraft at 4 m.p.h. and the plane is receding from me at 300 m.p.h., then you recede from me at 304 m.p.h. "Common sense," Newton, and Einstein would all agree on this. But if you could walk at $0{\cdot}25c$ and the plane moved at $0{\cdot}5c$, the Newtonian mechanics would give your recession speed as $0{\cdot}75c$, whereas Einsteinian relativity would give about $0{\cdot}71c$. Although at the everyday speed of 300 m.p.h., the disagreement, though present in principle, is absolutely negligible, at speeds near that of light it becomes very pronounced. Many experiments show that the relativity answer is right.

Equivalence of mass and energy.

Another famous consequence of relativity is the equation $E = mc^2$, connecting energy, E, with mass, m. c is so great that when mass is converted to energy a small mass gives a large energy. The grim demonstration of this was given to the world at Hiroshima; a more hopeful one at Calder Hall, the world's first nuclear power station. The life-giving energy of the sun is derived from nuclear processes which consume mass and deliver energy according to this equation.

Mass and rest mass.

"Mass" is far from being a simple notion. The only complication we shall note here is that the mass of a body is not necessarily constant. A stationary body can be observed to have a mass called its *rest mass*. If the body moves, it has energy of motion and therefore, according to Einstein's mass–energy equation, it increases its mass. Mass thus depends on speed, but in such a way that there is very little change unless the speed approaches that of light. Many experiments on atomic particles demonstrate this. The interesting question now arises: do all fundamental particles have rest mass? or do some have mass derived solely from their energy? The answer appears to be that photons and neutrinos have no rest mass; all other particles have. The Table on F14 gives their rest masses.

Special theory of relativity.

The mathematical development of Einstein's ideas, leading to the conclusions just referred to, constitutes the Special Theory of Relativity. Stated more generally, the theory raises the question whether two observers in uniform relative motion could ever detect, as a result of their relative speed, any difference in the physical laws governing matter, motion, and light. To this, Special Relativity answers: No. The detailed theory involves special consideration

of the results the two observers would obtain when measuring (i) the spatial distance, and (ii) the time interval, between the same two events. It turns out that they would not agree on these two points. They would agree, however, on the value of a certain quantity made up jointly of the spatial distance and the time interval in a somewhat complex combination. The intimate mixture of space and time in this quantity has led to the treatment of the three space dimensions and time on an equivalent footing. Hence the frequent references to time as the "fourth dimension." Minkowski devised an extremely elegant presentation of relativity theory by using an extension of ordinary geometry to four dimensions. A line drawn in his four-dimensional space represents the path of a particle in space and time, *i.e.*, the whole history of the particle. Thus the movement of particles in the ordinary world is turned into the geometry of lines in Minkowski's four-dimensional world of "space-time."

SOME MEMBERS OF THE ATOMIC FAMILY

The numbers in brackets after the name denote first the electric charge and second, the mass. The charge on an electron is counted as -1 unit and the electron mass as $+1$ unit. Thus ($+1$, 207) means the particle has a positive charge of 1 unit and a mass 207 times that of the electron.

Photon (0, 0)	A quantum of electromagnetic radiation, *e.g.*, light, X-rays, γ-rays. The concept was introduced by M. Planck in 1900 when he described the emission of light as taking place in "packets" rather than in a steady stream. The energy of a photon is proportional to the frequency of the radiation and inversely proportional to the wavelength.
	Leptons
Electron (-1, 1)	Discovered by J. J. Thomson in 1897. The number of orbital electrons in an atom determines its chemical properties. Actual rest mass = $9{\cdot}1 \times 10^{-28}$ gm. Emitted as β-rays by some radioactive nuclei. A stable particle.
Positron ($+1$, 1)	Positive counterpart or, "anti-particle," to the electron. Predicted theoretically by P. A. M. Dirac in 1928 and first discovered in cosmic rays by C. D. Anderson in 1932. Emitted as β-rays by some radioactive nuclei. When positrons and electrons collide they usually annihilate each other and turn into γ-rays; consequently, positrons only last about 10^{-10} sec. within ordinary matter, but are stable in isolation.
Neutrino (0, 0) and Anti-neutrino (0, 0)	These particles travel with the speed of light and are distinguished from one another by the relation of their spin to their direction of motion. A neutrino is emitted with the positron during positive β-decay; and an anti-neutrino with the electron during negative β-decay. Their interaction with matter is extremely slight. First postulated by Pauli in 1933 and detected in 1956. π-meson decay also produces neutrinos and anti-neutrinos but in 1962 it was proved experimentally that these are a different species. Thus there are two kinds of neutrino each with an anti-neutrino. All these particles are distinguished from photons by having different spin.
Muon (± 1, 207)	Similar to, but heavier than, the electron and positron: disintegrates into electron (or positron if positive) + neutrino + anti-neutrino.
	Mesons
Pion (± 1, 273) or (0, 264)	The π-meson. Charged pions decay either into muons and neutrinos or into electrons and neutrinos. Neutral pions decay into γ-rays, into "positron-electron pairs," or both. Pions are intimately connected with nuclear forces, *i.e.*, with the "strong" interaction.
Kaon (± 1, 967) or (0, 974)	The K-mesons. These decay in many different ways producing other mesons, electrons, and neutrinos.
	Baryons
Proton ($+1$, 1836·1)	The positively-charged constituent of nuclei; the hydrogen nucleus is one proton. Fast-moving protons occur in cosmic rays. Does not spontaneously disintegrate.
Anti-proton (-1, 1836·1)	Negative anti-particle of the proton. Its existence was long suspected. Artificially produced and detected for the first time in 1955. Will react with the proton to produce pions or kaons.
Neutron (0, 1838·6)	Discovered by J. Chadwick in 1932. The neutral constituent of nuclei. When free it spontaneously disintegrates into a proton, an electron, and an anti-neutrino, after an average lifetime of about 18 minutes. Passes through matter much more easily than charged particles.
Anti-neutron (0, 1838·6)	The anti-particle of the neutron from which it is distinguished by properties connected with its magnetic moment and spin. Will react with neutron to produce pions or kaons.
Lambda Particle (0, 2183)	Discovered in 1947. Decays into proton plus pion.
Sigma Particle (0 or ± 1; about 2330)	Various modes of disintegration, producing neutrons, protons, mesons and lambda particles.
Omega Minus (-1, 3270)	Predicted by recent theory and discovered at Brookhaven, New York, in 1964. Still under intensive study.

Gravitation.

General theory of relativity.

The apparently innocuous extension of the preceding ideas to include observers in accelerated relative motion opened up new fields of mathematical complexity, but enabled Einstein to bring gravitation into the argument. In speaking of atoms and particles we have not yet mentioned gravity. This is because the electrical and magnetic forces acting between the particles constituting matter are much stronger than the gravitational: gravity need not enter atomic theory at all. But in the discussion of astronomical problems and the movements of large-scale, electrically uncharged bodies, it has been usual, ever since Newton, to say that two bodies of mass m_1 and m_2, separated by a distance r, attract one another with a force proportional to m_1m_2/r^2. This is Newton's inverse square law of gravitation. With this, Newton explained the movements of planets and comets and the falling to earth of the apple from his tree.

The apple's fall is accelerated, and we observe this by noting its position relative to certain marks fixed with respect to us, and by timing it with some sort of clock. This system of location in space and time may be called our "frame of reference." We therefore assert that, in our frame of reference, the apple falls down with an acceleration which Newton saw no alternative but to attribute to a thing called gravitational attraction. Galileo had shown that *all* bodies fall with the same acceleration at all points, and we can now rephrase this by saying that in our frame of reference there is a constant gravitational attraction or *uniform gravitational field*. (This last statement and Galileo's demonstration only refer strictly to points fairly near the earth's surface; at greater distances the gravitational field decreases and is therefore not uniform.)

Now suppose a collection of falling bodies is observed by an intelligent creature, designated C, who inhabits one of them. C has his own frame of reference fixed relative to him. In C's frame neither his own body, nor any of the others, is accelerated, and therefore he has no reason to suppose a gravitational force is acting on them. We have, therefore, the following situation:

(i) in our frame, fixed relative to us, we find all the bodies falling subject to a gravitational pull;

(ii) in C's frame, undergoing accelerated fall relative to us, no gravitational field is apparent.

It looks, therefore, as if one has only to choose the correct frame of reference for the measurements in order to remove the need for any assumptions about the existence of gravitational fields. This is a simple illustration of the connection between gravitation and frames of reference for the measurement of space and time. Einstein's General Theory of Relativity extends this to cover non-uniform gravitational fields and shows that what Newton taught us to call the gravitational field of material bodies is better thought of as a peculiarity of the space and time in the neighbourhood of such bodies. Since space–time, as we mentioned above, can be expressed in geometrical terms, Einstein has transformed the theory of gravitation into an exercise (a difficult one) in the geometry of space–time. Other physicists, in Einstein's tradition, are trying to turn *all* physics into geometry, but no one knows whether this is really feasible.

All this abstruse work is much more than a demonstration of mathematical power and elegance. Observable phenomena which fall outside the scope of Newton's theory of gravitation are accounted for by relativity. One is the small but definite discrepancy between the actual orbit of the planet Mercury and the predictions of Newton's theory. Another is the bending of stellar light rays as they pass close to the sun, an effect which results in the apparent displacement of the position of the star. A third is the effect of a gravitational field on the wavelength of light emitted by atoms. Similar atoms in different places in a gravitational field emit radiations with slightly different wavelengths. For example, the light from an atom in the intense field of a star should have slightly longer wavelength than the corresponding light from an atom on earth. This effect has always proved very difficult to detect with certainty. However, Einstein's prediction was verified with moderate accuracy in 1960 by a very subtle method which was purely terrestrial in its operation. The atoms being compared were placed at the top and bottom of a water tower and the difference in their emission was detected by means that belong rather to nuclear physics than to astronomy.

Particles.

Nature seems to use four different kinds of force to make one particle interact with another. The weakest force is gravity; while this dominates celestial mechanics its effect inside atoms is negligible compared with the other three. The binding forces inside atoms are *electromagnetic*, *e.g.*, the attraction of nuclei for electrons. Considerably stronger still is the nuclear force which holds the nuclei together and this is called the *strong interaction*. The fourth force is called the *weak interaction* and is intermediate in strength between electromagnetic and gravitational forces. It is responsible for a number of phenomena of which the best known is β-radioactivity.

Particles may respond to some or all of the forces. Protons are involved with all of them but electrons respond to all except the "strong interaction." When new particles are discovered physicists try to find out their fundamental properties and among these is their response (if any) to each kind of force. Some other basic properties are: electric charge (if any), mass (if any), and the speed with which the particle splits up spontaneously into other types.

In the last few years *Pears* has contained a table of "elementary particles" headed The Atomic Family. By 1965 so many of these had been discovered (about a hundred) that the whole conception of "elementary-ness" was in question. Are all the particles equally "elementary"? Are some of them excited states or combinations of others? When a family reaches a hundred it becomes difficult to believe they are *all* grandparents. One current trend is away from setting up a hierarchy in which some particles are elementary and some composite and towards treating them all as mutually dependent for their existence. This, however, is a very difficult problem, not yet solved.

A few particles are stable but most decay into products. The lifetimes of unstable particles are extraordinarily short by everyday standards but, even so, some (of about 10^{-17} sec. or upwards) are much longer than others (of about 10^{-23} sec.). The Table on page F14 contains the stable particles and a *selection* of the moderately unstable ones with brief comments on their properties.

The Table shows a rudimentary classification into four groups: (i) the photon; (ii) leptons—which are particles, lighter than protons, which do not react to the "strong" type of force; (iii) mesons—which are particles, lighter than protons, which are subject to all the kinds of force; (iv) baryons—which include protons, neutrons, and heavier particles, all of which react to the "strong" force. Many of these particles have been produced for the first time in recent years by bombarding matter with beams of high energy particles. Much of this work is done in the large accelerating machines at Brookhaven, New York, and the European Organisation for Nuclear Research, Geneva.

Forming particles into groups is an important matter. It is comparable with arranging chemical elements into the Periodic Table. The pattern does not of itself explain anything but it strongly suggests where to look for explanations. The classification of particles currently favoured is based on the very sophisticated mathematical ideas known as *group theory*. Group theory is a branch of mathematics which is finding increasing application in physics and it had a resounding success recently which illustrates the value of grouping. It turned out that there was no known particle to occupy a vacant position in one of the

family groups required by the theory. This particle, the omega minus, was sought and found with exactly the right properties in February 1964. This is reminiscent of finding the missing elements in the Periodic Table. The discovery of omega minus generated much excitement in the scientific world and many physicists believe that a new and deeper understanding of fundamental physics is just round the corner. If this turns out to be so, then the careful grouping and classification of particles according to regularities in their properties will have played a vital role.

Conclusion.

Over a century's development of the atomic ideas has brought a progressive, if jerky, increase in the mathematical precision of the theories. In some fields of particle physics, observations to one part in a million, or even better, can be explained, to that level of accuracy, by the existing theories. At the same time, however, the theories have lost visual definition. An atom as an invisible but none the less solid billiard ball was easy enough; so was a light wave conceived like a sound wave in air. Even after Rutherford, an atom consisting of a miniature solar system merely exchanged the solid billiard ball for a system of revolving billiard balls and was no great obstacle to visualisation. But since quantum theory and the Uncertainty Principle, every unambiguous visualisation of fundamental wave-particles leaves out half the picture, and although the electrons are in the atom, we can no longer represent them in definite orbits. The moral seems to be that visualisation is unnecessary, or at best a partial aid to thought. All the theoretical knowledge is in the equations, and these are very precise. Hence the non-physicists' grumble—that physics is too mathematical these days—has some justification, and hence also the growing distinction in physics between the theoreticians, who are usually mathematically trained, and the experimenters, who can rarely read the papers their theoretical colleagues write, but provide the results for them to write about.

II. THE PROPERTIES OF MATTER IN BULK.

One of the most obvious and at the same time most wonderful things about the properties of matter is their great variety. Think of air, diamond, mercury, rubber, snow, gold, pitch, asbestos. . . . Even the differences of state of the same chemical substance are remarkable enough, ice, water, and steam, for example. One of the aims of physics is to reach an understanding of all these different properties by explaining them in terms of the behaviour of the particles discussed in the previous section (F9–15). The widespread success with which this imposing programme has been carried out indicates the maturity of physics. It is difficult to think of any major property of matter in bulk for which there is not some attempted theoretical explanation, though future physicists will no doubt regard some present-day theories as rudimentary or incorrect.

Physics, Statistics, and Thermodynamics.

Take a number equal to the population of London, multiply it by itself, and multiply the product by another million. The answer is about the number of molecules in 1 cubic centimetre of ordinary air. They are constantly moving about and colliding with one another. Even if the nature of the molecules and their laws of motion were perfectly understood, it would clearly be impracticable to calculate the exact paths described by each particle of so vast an assembly. This difficulty brought into being a whole branch of physics concerned with calculating the overall or average properties of large numbers of particles. Just as statisticians will provide the average height, income, expectation of life, and so on, of the population of London, without knowing everything about every individual, so statistical physicists can work out average properties of molecules or atoms in large groups. This important branch of physics is called *Statistical Mechanics*. It was founded in the nineteenth century by Maxwell, Boltzmann, and Gibbs and is still being actively developed.

Consider now all the molecules in 1 cubic centimetre of air contained in a small box. They are continually bombarding the walls of the box and bouncing off. This hail of impacts (it is actually about 10^{23} impacts per square centimetre per second) is the cause of the pressure which the gas exerts against the walls of the box. Now suppose we pump air in until there is twice as much as before, though the box is still the same size and at the same temperature. This means that the density of the gas (*i.e.*, the mass of 1 unit of volume) has doubled. We should now expect twice as many impacts per second on the walls as before, and consequently twice the pressure. We therefore arrive at a conclusion that, if the volume and temperature are constant, the pressure of a gas is proportional to its density. This is one of the simplest statistical arguments that can be checked against observation; in fact, it stands the test very well.

Heat, temperature, and energy.

The proviso about the temperature remaining the same is an important one for the following reason. In the nineteenth century there was much discussion about the nature of heat. To Joule we owe the now well-established view that heat is equivalent to mechanical work. In one of his experiments, in the 1840s, the work necessary to rotate paddle wheels against the resistance of water in a tank generated heat that caused a slight rise in the temperature of the water. Joule found out exactly how much work was equivalent to a given quantity of heat. However, one can do other things with work besides generate heat; in particular, work creates motion, as when one pushes a car. Bodies in motion possess a special form of energy, called kinetic energy, which is equal to the work done in accelerating them from a state of rest. We have, then, three closely connected ideas: work, heat, and kinetic energy. Now according to the views of the nineteenth century, which are still accepted, any heat given to a gas simply increases the kinetic energy of its molecules; the hotter the gas, the faster its molecules are moving. If, therefore, the gas in our box is allowed to get hotter, there is an increase in molecular speed, and the impacts on the walls become correspondingly more violent. But this means the pressure increases, so we have another law: if the density remains the same, the pressure increases if the temperature does.

Laws of Thermodynamics.

Such considerations as these have been pursued with great elaboration and subtlety. The notions of heat, temperature, energy, and work—familiar but vague in everyday life—have been given precise definitions, and the relations between them have been enshrined in the Laws of Thermodynamics. Enshrined is perhaps a suitable word, because these laws are so soundly and widely based on experimental results that they have greater prestige than any others in physics. If any proposed physical law comes in conflict with thermodynamics, then so much the worse for that law—it has to be revised. It is sometimes asserted that no one is properly educated who does not understand the Second Law of thermodynamics. We cannot, therefore, leave this section without at least stating the two best known thermodynamic laws:

First Law: *If any physical system is given a quantity of heat, and if the system performs some work, then the energy of the system increases by an amount equal to the excess of heat given over work done.* This law asserts that heat, energy, and work are convertible one into the other, and that all such transactions balance exactly. This is one form of a principle accepted as fundamental in all science, *viz.*, the Principle of the Conservation of Energy, according to which energy can never be created or destroyed, but only changed from one form to another.

Second Law: *It is impossible to make an engine which will continuously take heat from a heat source and, by itself, turn it all into an equivalent*

amount of mechanical work. In fact, all engines which produce work from heat—steam engines for example—always use only a fraction of the heat they take in and give up the rest to some relatively cool part of the machine. The Second Law makes this obligatory on all work-from-heat devices. This statement of the Second Law has an engineering ring about it and, indeed, it arose from the work of the nineteenth-century French engineer Carnot. Nevertheless, it can be rephrased in very abstract terms, and has been applied with unbroken success to all fields of science involving the transfer of heat and allied matters. It sets a definite limit to the kinds of physical process that can be conceived to take place. Nothing has been known to contravene it.

The States of Matter.

The molecular motion in gases has been referred to in the previous section. Tacitly it was assumed that each molecule acted independently of all others, except that collisions occurred between them. In reality, molecules exert attractive forces on one another and, if a gas is cooled so that molecular movements become relatively sluggish, a time comes when the attractive forces succeed in drawing the molecules close together to form a liquid. This process is called condensation.

The molecules in a liquid are packed tightly together and they impede each others' movements. On the other hand, movement still persists, and the molecules struggle about like people in a milling crowd. Besides wandering about, the molecules vibrate. These motions represent the energy contained in the liquid.

The fact that the molecules, though irregularly packed, can still slip past one another and move from place to place, explains the essential property of liquids that distinguishes them from solids—ability to flow. As a matter of fact, although the rather vague assertion that in a liquid molecules are irregularly packed would be generally accepted, there is no agreed opinion on what the irregularity is actually like. Indeed, not only the precise structure of liquids, but the theory of liquids in general, is fraught with such considerable mathematical difficulties that the liquid state is much less well understood than the solid or gaseous.

Most solids are crystals. The popular idea of a crystal is of something which has a more or less regular geometrical form with faces that glint in the light—like snowflakes or gems. However, crystallinity really depends on a regular inner pattern of the atoms, and may or may not show itself on the visible surface. A lump of lead, for example, is crystalline, though it may not look it.

The actual arrangement of the atoms in a crystal can be extremely complex. Some are quite simple, however. The largest model of a crystal structure must surely be the 400-ft. "Atomium" building in the 1958 Brussels Exhibition. This consisted of eight balls, representing atoms, situated at the corners of a cube, and one more ball exactly in the middle. Imagine this repeated in all directions so that every ball is the centre of a cube whose corners are the eight neighbouring balls. This is known to crystallographers and physicists as the "body-centred cubic structure"; it is the actual arrangement of atoms in iron, sodium, chromium, and some other metals. If every ball, instead of being the centre of a cube, were the centre of a regular tetrahedron (a solid figure with four equal triangular faces), and had its four neighbours at the corners of the tetrahedron, then we should have the "diamond structure." This is how the carbon atoms are arranged in diamonds.

In crystals the atoms are locked into a regular ordered structure by attractive forces which give the solid its rigidity and prevent it from flowing. The atoms are so close together that any attempt to press them closer involves crushing or distorting the atoms—a process they resist strongly. This explains why solids (and liquids too) are so difficult to compress. Gases can easily be compressed because there is so much space between the molecules.

The distinction between solid and liquid is not so sharp as is commonly supposed. A lump of dough will not bounce, but is plastic; a steel ball-bearing is very elastic and bounces excellently, but one cannot mould it in the fingers. Neither dough nor steel qualifies for description as a liquid. There are, however, substances which can be moulded like plasticine into a ball that will then bounce very well on the floor like an elastic solid, and finally, if left on a flat table, will spread into a pool and drip off the edge like a liquid. There is no point in trying to force such things into rigid categories. One may say instead that for short, sharp impacts the material behaves like an elastic solid, but under long-sustained forces it flows like a liquid. The properties of these, and many other anomalous materials, are increasingly engaging the attention of those who study the science of flow—*rheology*. It is interesting to see how many familiar and important materials exhibit peculiar rheological behaviour—paint, dough, ball-pen ink, cheese, unset cement, and solutions of nylon and other plastics are only a few examples.

Inside a Crystalline Solid.

We now return to our wallpaper analogy of crystal structure and give some free play to our visual imagination.

Suppose we have walls papered with a regular pattern of, say, roses, fuchsias, and green leaves. These represent the different kinds of atoms in the solid. Careful observation shows that the whole pattern is shimmering. The flowers and leaves are not stationary, but are undergoing slight random oscillations about their proper positions. In a crystal these movements are called thermal vibrations, and are never absent. The hotter the crystal, the more the vibration, and at a high enough temperature the vibrations become so great that the atoms get right out of position and the pattern disappears altogether, *i.e.*, the crystal melts. Thermal vibrations are essential to the theory of solids, and are responsible for numerous physical properties.

Next we note something extraordinary about some of the papered walls. On these the paper has been hung in irregular patches fitted together like a not very well-made jig-saw puzzle. Lines of roses which should be vertical are horizontal in some patches, oblique in others. This represents the situation in most ordinary solids, for they consist of many small pieces of crystal irregularly packed together. Such material is called *polycrystalline*, and the small pieces are *crystal grains*. Crystal grains may be almost any size, sometimes visible to the naked eye, as often on galvanised iron.

However, on one wall, we see excellent regularity and no obvious patches at all. The physicist would call this a *single crystal*, and several techniques exist for preparing them. Natural single crystals can be found, and there are some beautiful large single crystals of rock salt. But on examining the single crystal wall closely, we find a number of places where the paperhanger has failed to make adjacent pieces register perfectly—there is a slight disjointedness. This occurs in real single crystals, and the line along which the structure fails to register is called a *dislocation*. These are much studied by physicists because of their bearing on the mechanical properties of solids, on the yielding of metals under strong stress, for instance.

This by no means exhausts the possibilities of the wallpaper analogy; several other phenomena can be found. For example, in a place where there should be a fuchsia there is actually a daffodil—something completely foreign to the pattern. Or perhaps a small wrongly shaped leaf is jammed between the proper leaves in a place that should really be blank. These represent chemical impurity atoms. The first is called *substitutional*, because it occupies the position of an atom that should be there, the second is called *interstitial*, because it does not. Substitutional impurities of indium metal, deliberately added to the semi-conductor germanium, make possible the manufacture of transistors (*see* Section L). Some steels derive their valuable properties from interstitial carbon atoms within the iron pattern.

What physicists call a vacancy would occur if a flower or leaf were simply missing. Remembering that all the atoms are vibrating, we should not be surprised if occasionally an atom jumps into a neighbouring vacancy if there happens to be one,

i.e., the atom and the vacancy change places. Later this may occur again. In the course of time, a rose which was near the ceiling may make its way to the floor by jumping into vacant rose positions when they occur near enough. This process, which the physicist calls *diffusion*, is also analogous to the game in which numbers or letters can be moved about in a flat box because there is one vacant space to permit adjustment. The more vacancies there are in a crystal, the faster diffusion occurs. It is, in fact, very slow in solids, but is nevertheless evidence that apparently quiescent materials are really internally active.

Metals, Electricity, and Heat.

There is ample evidence that inside metals there are large numbers of free electrons. To illuminate this statement let us take sodium metal as an example. One single sodium atom has a nucleus with eleven protons; there are therefore eleven electrons in the atom. The outermost one is easily detached, leaving a positively charged sodium ion behind. We may think of these ions arranged in the three-dimensional pattern characteristic of sodium crystals. It is the same as the iron structure previously described. The detached electrons, one per atom, occupy the spaces in between. The usual metaphor is that the structure of ions is permeated by a "gas" of electrons. Like all visualisations of fundamental particles, this must be taken as a rough approximation. The important point is that the electrons in the gas are not bound to individual atoms but may wander freely about the crystal, hindered only by the collisions they make with the vibrating ions.

This is the picture as it appeared to physicists of the first decade of this century, and we can explain many properties of metals with it. Naturally the theory has developed greatly since then, thanks to the great work of Lorentz, Sommerfeld, and Bloch; it now relies heavily on quantum theory, but it is surprising how little violence is done to modern ideas by the simple picture we are using.

The free electrons move randomly in all directions at thousands of miles per hour. If the metal is connected across a battery it experiences an electric field. Electrons are negatively charged particles, and are therefore attracted to the electrically positive end of the metal. They can move through the metal because they are free; this flow is not possible to those electrons which remain bound to the ions. The function of the battery is to keep the flow going and, for as long as it is going, it is the electric current.

The flow of electrons is not unimpeded. They constantly collide with the ions and are deflected from the path of flow. This hindrance is what the electrician calls *electrical resistance*. The electric force, due to the battery or a dynamo, accelerates the electrons, thus giving them extra energy; but they lose this to the ions at collisions because the ions recoil and vibrate more than before. The net effect of innumerable collisions is to increase the thermal vibrations of the ions, *i.e.*, to make the metal hotter. This is the explanation of the fact well known to every user of electric irons; that electric current heats the conductor. If a strong current is passed through a wire, the heating is so great the wire glows, as in electric-light bulbs, or melts and breaks, as in blown fuses.

If one end of a metal rod is heated we soon feel the heat at the other end; metals are excellent thermal conductors. This is because the mobile free electrons carry the heat energy down the rod, passing it on to the ions by colliding with them. Substances without free electrons cannot do this, nor can they conduct electricity well; so we have, in the free electrons, an explanation of the fact that the good electrical conductors are the good heat conductors. For technical purposes, it would be useful to have electrical insulators that would conduct heat well, and *vice versa*; but this is almost a contradiction in terms, and one can only compromise.

Non-conductors and Semi-conductors.

There are some elements, and numerous compounds, in which all the electrons are so tightly bound to their parent atoms that free electron flow is impossible. These materials are electrical and thermal insulators.

Let us return to our sodium atom. It readily loses its outer electron, forming a positive ion. The ion is very stable; indeed, its electron arrangement resembles the "closed shell" belonging to the inert gas neon. The chlorine atom, on the other hand, would have a very stable structure, resembling the inert gas argon, if only it could be given one extra electron to complete the closed shell. If the outer sodium electron were given to a chlorine atom we should have two stable ions, one positive and one negative. These would then attract each other and form a compound. This is just how common salt, sodium chloride, is formed, and its crystals consist of a regular network of alternate sodium and chlorine ions. As all the electrons are bound to ions, it is not surprising that salt will not conduct electricity or heat to any appreciable extent. Not all insulating compounds are built on this pattern, but all have structures which bind the electrons tightly.

We have seen (F17) that Nature does not permit a hard-and-fast distinction between solids and liquids; nor does she between conductors and insulators. Over a hundred years ago, Faraday knew of substances which would conduct electricity, but rather badly. A common one is the graphite in pencils. Others are the elements selenium, germanium, and silicon, and a considerable number of compounds. Such substances are called semi-conductors.

Semi-conductors conduct badly because they have so few free electrons, many thousands of times fewer than metals. In very cold germanium—say, 200 degrees below freezing—all the electrons are tightly bound to atoms and the substance is an insulator. It differs from normal insulators in that, on warming it, the gradually increasing thermal vibration of the crystal detaches some of the electrons, for they are only moderately tightly bound. The warmer the crystal becomes, the more of its electrons become detached and the better it conducts electricity. By about the temperature of boiling water, there are so many freed electrons that conduction is moderately good, though less good than in metals. This is basic semi-conductor behaviour. Because transistors can be made of germanium, and because they are of such great technical importance, more knowledge has accumulated about germanium than about any other material. *See also* Transistor, Section L.

Magnetism.

The most important thing about magnetism is that it is inseparably connected with electricity. Oersted showed this in July 1820, when he deflected a magnetic compass needle by passing an electric current through a wire near it. Since then, many experiments have shown that wherever a current flows there will certainly be a magnetic field in the surrounding space. The laws of this are very well known now—they are the Maxwell equations previously referred to (F13). However, most people first meet magnetism when, as children, they pick up pins with a magnet. Where is the electricity here? and what is a magnet?

The explanation of magnetism exemplifies beautifully the technique of explaining the bulk properties of matter in terms of fundamental particles. In the atoms the electrons are moving, and a moving electric charge constitutes an electric current. Therefore each moving electron is a tiny source of magnetism. It does not immediately follow that every atom is a source of magnetism because it might—and often does—happen that the magnetic effect of different electrons in the atom cancel out. In helium atoms, for example, the two electrons have equal but opposed magnetic effects. Nevertheless, some atoms and ions have a net effect called their *magnetic moment*. This simply means they behave like tiny magnets. Crystals containing such atoms will be magnetic, though the magnetism is much weaker than in ordinary magnets because the different atoms largely annul one another's effects. In a very limited number of crystals, however, the magnetic ions act on one another in a special way which forces all the

atomic magnets to point in the same direction. The total effect of many co-operating atoms is very strong and the crystal becomes what we normally call a magnet. Iron acts like this, so do cobalt and nickel, the rarer elements gadolinium and dysprosium, and a fair number of alloys. On the whole, this behaviour, which is called *ferromagnetism*, is very rare. The reason for the co-operation of all the atomic magnets is not explained to everyone's satisfaction yet, though the key idea was given by Heisenberg in 1928.

In the section dealing with the electron it was pointed out that every electron has an *intrinsic* magnetic moment. This is in addition to any effect simply due to the electron's motion round a nucleus. The net effects of ions are therefore partly due to the intrinsic magnetism of electrons. In the ferromagnetic metals the latter is by far the most important contribution. Thus we pick up pins, and benefit from magnets in other ways, because innumerable fundamental particles act in co-operation for reasons that are still somewhat obscure. It is interesting to ask whether the electrons responsible for magnetism are the same free electrons that allow the metals to conduct electricity. It is thought not.

We are accustomed to think of magnets as metallic. Actually the magnet originally discovered by the Chinese was the mineral lodestone, which is a non-metallic oxide of iron. Nowadays a number of non-metallic magnets are made. They are called *ferrites*, and some are insulators and some are semi-conductors. The combination of magnetism and insulation is technically very valuable in radio, radar, and other applications. The explanation of ferrite behaviour is related to that of metallic ferromagnetism, but is not the same.

Conclusion.

The aim of the second part of this account of physics is to show how our conception of fundamental particles allows us to build theories of the properties of matter. This very aim shows that the two " major divisions " of physics referred to at the beginning (F9) are divided only in the way that labour is divided by co-operating workers to lighten the task. For the task of physics is a very great one—no less than to explain the behaviour of matter; and since the universe, living and inanimate, is made of matter, physics must necessarily underlie all the other sciences.

II. BIOLOGY—THE SCIENCE OF LIFE.

Biology embraces the study of all living things which exist on earth at the present time and also the recognisable remains of those that are extinct. Living things or organisms range from the apparently simple micro-organisms such as viruses and bacteria to the largest animals and plants.

Living Processes.

The enormous variation and complexity of living processes make the task of understanding and defining life a very difficult one. Every living organism undergoes continual physical and chemical changes which, in spite of their diversity, are referred to as the metabolism of the organism. Metabolism involves the processing of food materials, the production of waste products, and all the intermediate stages between these whereby energy and matter are provided for the operation, maintenance, and growth of the organism. These reactions are under very exact chemical or nervous control at every stage and can be slowed down or speeded up as the need arises. Thus the organism can react to changes in the environment in which it lives, adjusting its activities in relation to the external changes. Finally, organisms can reproduce either in an identical or very slightly modified form. In this process new individuals are produced and the species continues to survive. Differences between offspring and parents can, under certain circumstances, act cumulatively over many generations and so form the basis of evolutionary change in which new species of organism are ultimately formed.

Molecular Biology.

It has been evident for many years that the most fundamental aspects of these living processes occur in basic structural units known as cells. We shall examine this level of organisation first before we attempt to look at the larger questions of the organisation of multicellular animals and plants and their interactions in groups or populations. The study of living processes at the molecular and cell level has been given a tremendous impetus in recent years by the advent of new techniques which enable microscopic and submicroscopic parts of cell to be examined. Physicists, chemists, and mathematicians have found themselves working alongside biologists in this field and several of the very notable advances have been made by physical scientists. At this level of organisation the traditional division of Biology into Botany, the study of plants, and Zoology, the study of animals, has little meaning. Even the more recent Genetics, the study of inheritance, Biophysics and Biochemistry, concerned with the physics and chemistry of organisms, and Cytology, the study of cell structure, are losing such identity as they may once have had. Molecular biology is a term frequently used in describing this rapidly expanding and fascinating field of research.

THE CELL.

Cells were first seen in 1665 by Robert Hooke when he looked at a piece of cork under his primitive microscope. It was not until 1839, however, that Schlieden and Schwann produced the cell doctrine which visualised the cell as both the structural and functional unit of living organisation. Exceptions may be found to the cell doctrine. For example, some protozoa, algae, and fungi show very complex internal organisation but are not divided into cells; they are usually called acellular organisms. The viruses also constitute a difficulty since in many ways they are intermediate between living and dead matter. They are absolutely dependent on cells of other organisms for their continued existence. Outside living cells they are inert molecules which may take a crystalline form. Inside a host cell, however, they become disease-producing parasites which multiply and show many of the other properties of living organisms. They are minute and lack the complex organisation usually associated with cells. Notwithstanding their somewhat ambiguous position, the viruses are often treated as though they were single cells or parts of cells and their extreme simplicity has made them ideal material for many types of research at this level. The bacteria also lack some of the properties of cells but the differences are not so clearly defined as they are in the case of viruses.

Structure and Function of Cells.

Though the constituent cells of a multicellular organism are usually specialised to perform particular functions, they have a great many features in common. The cell is often said to be made up of a substance called protoplasm, a term for the fundamental material of life which dates from the 19th cent. Protoplasm has two main constituents, the cytoplasm and the nucleus, and is bounded on the outside by a cell or plasma membrane. Plant cells generally have an additional wall composed primarily of cellulose and used for support. The nucleus is the controlling centre of the cell and has rather limited metabolic capabilities. The cytoplasm contains various subunits which operate to produce energy and new cell structure during the normal metabolism of the cell.

Cells take up the raw materials for metabolism

through the cell membrane from extracellular fluid which surrounds them. The nutrients include carbohydrates, fats, proteins, minerals, vitamins, and water. Fats and carbohydrates are important principally as sources of energy, though both types of compound are found in permanent cell structure. Proteins are complex substances of high molecular weight which contain nitrogen in addition to the carbon, hydrogen, and oxygen found in the other compounds. They are of fundamental importance in the structure and function of the cell and are built up of a number of simple nitrogen-containing organic molecules called amino acids. There are twenty amino acids occurring commonly in nature so that the number of possible combinations in large protein molecules is quite clearly enormous. A group of proteins whose significance is well established are the enzymes which are the catalysts of chemical reactions in living cells. Each enzyme will control and speed up a specific reaction even though it is present in very small amounts and is usually unchanged at the end of the process. A large number of inorganic mineral salts are essential for cells to function normally. Some, such as sodium, potassium, and calcium salts, are needed in considerable quantity; others are required only in trace amounts and these include iron, copper, and manganese. The trace elements are usually important constituents of enzyme systems. Vitamins are also necessary in very small amounts and it seems reasonable to conclude that their function is also a catalytic one in parts of some enzyme systems.

I. CYTOPLASM.

For a long time cytoplasm was thought to be a homogenous and structureless substrate in which enzymes occurred as part of a general colloidal system. With the refinement of techniques such as electron microscopy and ultracentrifugation, more and more identifiable components have been found within the cytoplasm. It now seems certain that the material other than these recognisable particles is not a structureless matrix but a highly organised and variable complex at the molecular level.

Identification of Components: recent techniques.

Ultracentrifuge.

When soft tissues such as liver are ground up in a homogeniser, which usually takes the form of a plunger fitting fairly tightly into a glass tube, the cells are broken up but the smaller particles escape destruction. The particles remain in a highly active biochemical state if the salt concentration of the liquid into which they are released by homogenisation is more or less the same as that within the cell from which they came. Early failures to isolate cell fractions were almost all attributable to osmotic difficulties in which differences of salt concentration led to the movement of water into or out of the particles and to their subsequent destruction. The homogenate can be treated in a centrifuge in which high speed rotation subjects the particles to forces many thousands times greater than gravity. As a result the heaviest particles, such as the nuclei, are deposited first on the bottom of the centrifuge tube. The liquid is then transferred to another tube and the process repeated at a higher speed which brings down slightly lighter particles called mitochondria. The next collection of particles which can be obtained is called the microsomal fraction. By careful use of this technique, biochemists can produce a variety of cell constituents which can be studied in the absence of all the other reacting systems of the cell.

Radioactive Isotopes.

In many of the studies of cell chemistry which have been made on whole cells, on cell fractions, or on isolated enzyme systems, progress has been due in a large part to the availability of isotopes. With the aid of compounds prepared in the laboratory and labelled with the radioactive isotopes of elements such as carbon, hydrogen, nitrogen, oxygen, sulphur, and phosphorus, biochemists can now follow the metabolic fate of these substances in living organisms. The presence of a radioactive "labelled" element in any of the products of metabolism can be determined by means of Geiger and scintillation counters. The studies involving radioactive isotopes have shown more clearly than any others that living material is never static but is in a state of dynamic equilibrium. Substances are constantly broken down and replaced by other substances so that an organism may appear to be more or less unchanging but its components are always turning over.

Light Microscopy.

Many of the particles which can be isolated and studied have been identified within the living cell by means of the light microscope. Especially useful in this respect have been the phase contrast and interference modifications which make structures of different refractive index visible and do not depend on differences in light absorption as does the ordinary instrument.

Electron Microscope.

In light microscopy true images of particles smaller than the wavelength of light cannot be formed. Great difficulty is experienced in resolving particles much smaller than 0·5 microns (0·0005 millimetre) in size. The electron microscope, which uses a beam of electrons instead of light, is capable of much greater resolution because electrons behave as rays of extremely short wavelengths. Details as fine as 20 Ångstroms (0·002 microns) have been resolved and a tremendous amount of structure has been revealed by this instrument. However, many of the objects which are well known from electron microscope studies have not been isolated nor have functions been ascribed to them. Conversely, much of the biochemistry of cells cannot be linked to known structures. One of the great limitations of the electron microscope is that it can only be used to examine very thin slices of dead material. *See* **Electron Microscope, Part IV.**

X-ray Diffraction.

A method which can reveal a great deal of information about the arrangement of constituent parts in very complex biological molecules is that of X-ray diffraction. In this method X-rays are reflected from regularities in the molecular structure so as to form a pattern characteristic of the structure. Studies of X-ray diffraction patterns can be made on living material so that the internal shape of biological molecules can be worked out and the changes, if any, followed during phases of activity. In many ways X-ray diffraction has been useful in filling the gaps between biochemical studies of molecular behaviour and the essentially static view of cell structure obtained from the electron microscope.

Constituents of Cytoplasm.

The following are some of the particulate and membranous constituents of cytoplasm which have been identified and analysed with varying degrees of success by these and many other techniques:

1. Mitochondria and Oxidation.

Mitochondria vary in shape from cylindrical rods to spheres and in size from 0·2 to 3·0 microns. When seen in the living cell they are in constant motion. The whole structure is enclosed within a thin double membrane, the inner layer of which is thrown into folds extending across the central cavity of the mitochondrion and dividing it into small chambers. The function of mitochondria is to provide energy for the reactions of the rest of the cell. Almost the whole machinery for the oxidation of foodstuffs is to be found in the mitochondria and, as might be expected, is related in some way to the complex structure. Slight damage to the mitochondrion will render it unable to carry out a complete cycle of oxidative processes. Destruction of parts of the double membrane system prevents the production of energy-rich phosphate bonds in adenosine triphosphate (ATP) in which energy is stored and transported about the cell.

The Krebs Cycle.

The oxidative reactions which produce the energy are quite unlike those in which hydrocarbons are burnt in the laboratory. They proceed through a large number of controlled steps during which the energy is slowly evolved. The basic fuel substances, carbohydrates, fats, and proteins, are broken down outside the mitochondria to four major intermediate products which are pyruvic acid, oxalacetic acid, acetic acid and ketoglutaric acid. These acids diffuse into the mitochondria and are oxidised in a cyclical system of reactions called the Krebs or citric acid cycle which ultimately leads to the production of carbon dioxide and water. The actual oxidation of the various compounds participating in the cycle is brought about by a series of enzymes described as an electron transport chain. Oxidation in these cases is essentially a removal of electrons from the substrate, invariably accompanied by an equal number of hydrogen nuclei. The electrons, sometimes with and sometimes without the hydrogen nuclei, are passed from one compound to another until eventually they combine with oxygen to form water. One of the best known electron transport systems is that involving iron-containing substances called cytochromes.

An example of a typical stage in the Krebs cycle is the conversion of succinic acid to fumaric acid under the control of the enzyme succinic dehydrogenase. Both acids are compounds containing four carbon atoms but the latter has two electrons and two hydrogen nuclei fewer than the former which is therefore said to be oxidised during the conversion. The electrons are accepted by the first member of a chain of cytochromes which is thus reduced and the hydrogen is set free as hydrogen ions. The electrons are passed down the chain of cytochromes which are reduced in turn and re-oxidise the earlier members of the chain. In the final stage the reduced cytochrome is oxidised by oxygen which accepts the electrons and combines with the hydrogen ions to form water. These steps produce energy, but this does not all appear as heat because some is used to drive a reaction which consumes energy. The first law of thermodynamics states that such a coupling is necessary if a high energy compound is to be produced. The energy consuming reaction is the conversion of adenosine diphosphate (ADP) to adenosine triphosphate (ATP) with its energy-rich phosphate bond. The whole process is known as oxidative phosphorylation. The mitochondria produce far more energy than they require and the ATP passes into the cytoplasm for use in the rest of the cell.

2. Chloroplasts and Photosynthesis.

Chloroplasts are particles found in cells in the green parts of plants, in fact they contain the green pigment which is called chlorophyll. They are involved in the extremely important process known as photosynthesis in which energy absorbed from light is used to synthesise carbohydrates from carbon dioxide and water, oxygen being formed as a by-product.

Chloroplasts are disc-shaped or flat ellipsoids from 2 to 20 microns across, possessing a complex structure which in many ways is reminiscent of that found in mitochondria. A typical double membrane surrounds the structure and the inside is made up very largely of a stack of discs consisting of paired membranes connected at their ends to form closed systems. This seems to be a further development of the type of lamellated structure seen dividing the central cavity of a mitochondrion. The chlorophylls and other pigments, such as the orange yellow carotenoids, seem to be arranged in layers a single molecule thick in the chloroplast discs so that they are maximally exposed to light.

Photosynthesis.

In photosynthesis there are two somewhat independent sets of reactions, one needing light and the other going on in the dark. The primary process is the absorption of light quanta by the chlorophyll which causes some of the electrons of its molecule to pass from one orbital to another and thus enter an excited state. It is thought that chlorophyll then loses electrons which pass either to a recently discovered protein called ferrodoxin or to another oxidising agent, plastoquinone. The electrons from plastoquinone are transferred via a complex series of steps involving a cytochrome chain back to the chlorophyll. During these sequences oxygen is liberated from water molecules and energy-rich phosphate bonds are produced. The production of ATP in this reaction, which can only take place in the light, is called photosynthetic phosphorylation and, in this respect, makes plants independent of stored carbohydrate as their primary energy source.

The reactions so far described have not involved carbon dioxide and though it is possible to make the system operate solely in this way it is not usual for it to do so. Normally the electrons from ferrodoxin are passed to another electron accepting system together with hydrogen ions from water. At the same time, as recent isotope studies have revealed, carbon dioxide is combined with a 5-carbon sugar and the resulting compound immediately splits into two molecules of a 3-carbon, phosphoglyceric acid. The reduced electron system which has oxidised ferrodoxin now comes into operation and, together with energy from ATP, is used to synthesise sugar and starch from the 3-carbon compounds. The reactions in which carbon dioxide is taken up or "fixed" and then reduced during the formation of sugar, can go on in the dark unlike those of photosynthetic phosphorylation described earlier.

The importance of this process whereby plants can make use of the energy in sunlight to fix carbon dioxide and produce carbohydrates is quite clear. The whole animal population of the world, including man, is dependent on plants for food since even the meat-eating carnivores prey upon herbivores. Although scientists continue to make efforts to produce adequate food materials from simple compounds, there is still no better machinery known for doing this than the plant cell. Man is dependent on photosynthesis not only for his supplies of food but also for much of

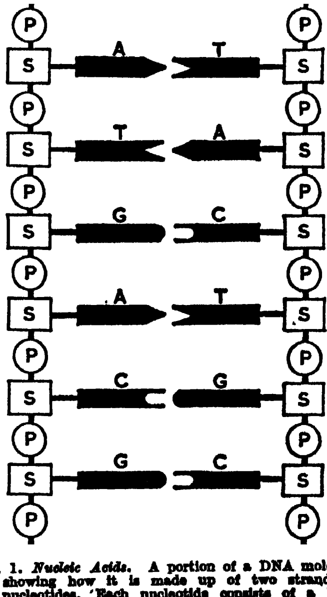

FIG. 1. *Nucleic Acids.* A portion of a DNA molecule showing how it is made up of two strands of nucleotides. Each nucleotide consists of a base, which may be Adenine (A), Thymine (T), Guanine (G), or Cytosine (C), united to the Pentose Sugar, Desoxyribose (S), in turn joined to Phosphoric Acid (P). The nucleotides are linked through the phosphoric acid groups. The two strands are held together by hydrogen bonds between bases, adenine linking only with thymine, and guanine only with cytosine.

his fuel, since much of the combustible material removed from the earth is of plant origin. In this respect atomic energy may eventually prove to be an adequate alternative.

3. Endoplasmic reticulum, Ribosomes, and Protein Synthesis.

A network of elaborate and oriented double membranes existing within parts of the cytoplasm can be seen in the electron microscope. In the space between the pairs of double membranes small granules are visible, either free in the space or attached to a membrane. The whole system is called the endoplasmic reticulum or ergastoplasm. When the cell is homogenised and centrifuged the endoplasmic reticulum appears as the microsomal fraction. Biochemical analysis after separation of the membranous from the granular components reveals that the former is composed largely of phospholipids and cholesterol, which are compounds closely related to fats, and the latter of ribonucleic acid (RNA).

Nucleic Acids.

The term nucleic acid covers a class of substances, usually of great complexity, built up from smaller units called nucleotides. Each nucleotide consists of a base, united to a sugar, in turn united to phosphoric acid. Nucleotides are joined together in a linear fashion by means of the phosphoric acid residues to form a chain from which the bases project at right angles (Fig. 1). Two types of sugar are found in naturally occurring nucleic acids and these are the ribose of RNA and the desoxyribose of desoxyribonucleic acids (DNA). We shall return to the latter when the nucleus is considered. Four nitrogen-containing bases occur in nucleic acids and in RNA—adenine, cytosine, guanine, and uracil. In DNA the uracil is replaced by thymine.

Protein Synthesis.

There is good evidence that RNA is manufactured exclusively within the nucleus and subsequently moves out into the cytoplasm. Some of it, called ribosomal RNA, unites with protein to form the granules, or ribosomes, of the endoplasmic reticulum. Another form, called messenger RNA, also migrates from the nucleus to associate with ribosomes but does not become incorporated into their permanent structure. It is also well established that the ribosomes are closely linked with protein synthesis in the cell because radioactive amino acids, when fed to an animal, are always found first in the ribosomes before any other cell structure. The specification for a particular protein is not carried on the ribosome which is merely the factory for making these complex molecules. It is thought that messenger RNA carries instructions from the nucleus which specify exactly the protein to be synthesised at a ribosome. This is done by means of a code in which a "triplet" of three nucleotide bases codes one amino acid (Fig. 2). Thus on a long molecule of RNA, three adjacent uracil bases would specify an amino acid called phenylalanine. If these were followed on the RNA molecule by one uracil and two guanines then the amino acid tryptophan would be specified and this would be

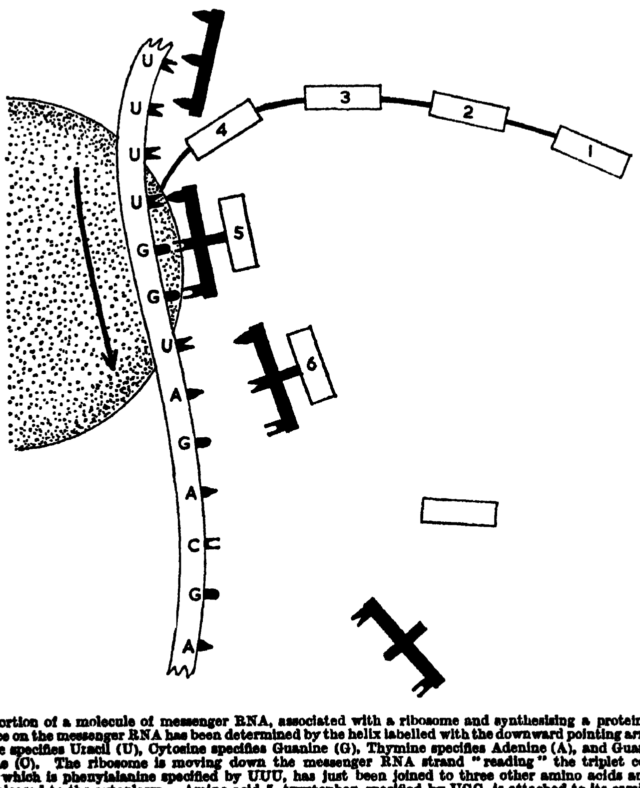

FIG. 2. A portion of a molecule of messenger RNA, associated with a ribosome and synthesising a protein. The base sequence on the messenger RNA has been determined by the helix labelled with the downward pointing arrow in Fig. 3. Adenine specifies Uracil (U), Cytosine specifies Guanine (G), Thymine specifies Adenine (A), and Guanine specifies Cytosine (C). The ribosome is moving down the messenger RNA strand "reading" the triplet code. Amino acid 4, which is phenylalanine specified by UUU, has just been joined to three other amino acids and its carrier RNA released to the cytoplasm. Amino acid 5, tryptophan specified by UGG, is attached to its carrier RNA and in position ready to be joined to the protein chain by the ribosome. Amino acid 6, methionine specified by UAG is attached to its carrier RNA but has not been brought into position on the messenger RNA strand. Other amino acids and carrier RNA molecules exist free in the cytoplasm and have not yet associated.

joined to the phenylalanine. In this way complex protein molecules can be built up according to instructions emanating from the nucleus for each of the 20 different amino acids. It is far from clear how the amino acids in the cytoplasm are brought into position on the RNA "template" and how they are activated so as to combine and form protein. It is thought that they are first attached, by appropriate enzymes, to small molecules of so-called carrier RNA in the cytoplasm before associating on the template of messenger RNA. The association is then accomplished by a ribosome which moves along the messenger RNA chain, as it were "reading" the code, and taking appropriate carrier RNA-amino acid complexes from the surrounding medium. There are still many gaps in our knowledge of the exact sequence of events.

This system is responsible for building and maintaining much of the organisation of the cytoplasm. All the enzymes, for example, catalysing every reaction within the cell will be specified and built up on the appropriate RNA template. The understanding of protein synthesis is of fundamental importance to the whole of biology and has particular significance in studies on cancer where cell growth becomes abnormal.

4. The Golgi Apparatus.

The characteristic features of the Golgi apparatus are numbers of large vacuoles or spaces, bordered by closely packed layers of double membranes. The latter look very much like the membranes of the endoplasmic reticulum but do not have the ribosome particles along their edge. They are therefore known as "smooth" membranes in contrast to the "rough" membranes of endoplasmic reticulum. The function of the Golgi apparatus is not established though it may be associated with secretory activity of the cell.

The Golgi apparatus has been the subject of controversy for many years and illustrates one of the major difficulties in working at the molecular cell level. The Golgi structure can only be seen through the light and electron microscopes after the cell has been through a number of preparative stages. Many biologists thought that the preparation itself was responsible for creating the Golgi apparatus and that nothing like the objects seen would really exist in the living cell. Though there is now little doubt that the Golgi apparatus is a real constituent of the cytoplasm, the general problem of creating artefacts by the involved treatment in many investigations remains a very real one.

5. Cell Membrane.

Though the cell membrane plays a most vital part in regulating what can enter and leave the cell, it remains rather poorly understood. It is thought to consist of a double layer of lipid molecules with a layer of protein probably outside the lipid. Fairly large molecules seem to be able to penetrate the membrane in relation to their fat solubility, which would support the hypothesis of its lipid framework. Small molecules and ions appear to penetrate in relation to their size, the smaller ones getting through more readily than the larger. This suggests that pores of a certain size exist in the membrane.

The cell membrane has mechanisms which can move ions and other substances against concentration differences either into or out of the cell. A fine microelectrode can be pushed into a cell and the electrical potential of the inside determined with respect to the outside. In all the cells studied so far there is a potential difference across the membrane which is produced by the non-uniform distribution on either side of ions, particularly those of sodium, potassium, and chloride. Though these potentials have been studied in animal and plant cells generally, they are best known from the work on nerve cells where sudden changes in the membrane potential are the basis of nerve impulses. A great deal is now known about the mechanism whereby the potential change, and thus the nerve impulse, is propagated from one end of a nerve to the other. The basic process which produces the nerve impulse in any region of the nerve fibre has been shown to be a sudden increase in permeability of the membrane to sodium ions in that region. A problem of much interest is how such activity can be passed from one nerve to the next, that is to say how a change of potential in one cell membrane can be made to affect an adjacent cell membrane. Such a process is fundamental to the large collections of nerve cells which form the nervous systems of animals. Transmission takes place at a special region called a synapse and when an impulse reaches this region it causes the release of a small amount of chemical transmitter substance which diffuse to the membrane of the adjacent cell. There it combines with the membrane in such a way as to change its permeability to ions and so produce a nerve impulse in the second cell. A number of transmitter substances have now been identified and many of them are related chemically to tranquillisers and other drugs affecting the nervous system.

II. NUCLEUS.

The main regions of the nucleus are the surrounding nuclear membrane, a mass of material known as chromatin, and a small sphere called the nucleolus. The nuclear membrane is a double structure very much like the membranes of the cell surface and endoplasmic reticulum. Suggestions have been made that these membranes are continuous at some regions within the cell. The status of chromatin was in doubt for many years. Light microscope studies reveal very little structure in the nucleus until the time when the cell is preparing for, and undergoing, division or mitosis. At this time a number of discrete double strands, the chromosomes, are revealed by virtue of their chromatin content—the material stains heavily with basic dyes.

Cell Division.

During division the chromosomes behave in regular and recognisable sequence. In the first stage called prophase they appear and at the same time the nuclear membrane breaks down. Next, in metaphase, the chromosomes become arranged across the equator of a spindle-shaped collection of fibrils which appears in the area formerly outlined by the nucleus. Then follows anaphase in which the two threads of each chromosome, the chromatids, move to opposite poles of the spindle. Finally in the last stage, telophase, nuclear membranes are formed round the two separate collections of chromosome material and the cytoplasm itself divides into two. Thus two cells are formed each containing the same number of chromosomes as the parent and the cells enter a period of rest, or interphase, between divisions. During interphase the chromatin material disappears and the possibility was considered of the chromosomes being assembled as a prelude to every cell division and then being dispersed in the nuclear sap afterwards.

This suggestion is in direct conflict with the view that chromosomes are the carriers of genes.

Genes.

These are the elements which contain all hereditary information and the medium whereby hereditary features are transmitted from one cell to the next, either in the same organism or from parents to offspring via the fertilised egg. Experiments indicated that the same genes always occupy the same position on chromosomes and this really demands a structural continuity through the life of the cell. The chromosomes undoubtedly persist, but it is still not certain why or how they change so as to become visible during division. One suggestion has been that the nucleic acids of which they are very largely made up condense during the period of prophase. In the resting nucleus the chromosomes may be much more swollen and occupy much of the nucleus.

The problem that has attracted the most attention and is possibly the most fundamental that biology has to offer is that of the nature of the

genes. The important material of the genes is known to be desoxyribosenucleic acid (DNA), made up of nucleotides as is RNA, though in this case the bases are adenine, cytosine, guanine, and thymine. The DNA molecule is large and complex. Two long chains of nucleotides are known to coil round in a double helix with the pairs of bases on each helix directed towards one another and linked by means of hydrogen bonds (Fig. 3).

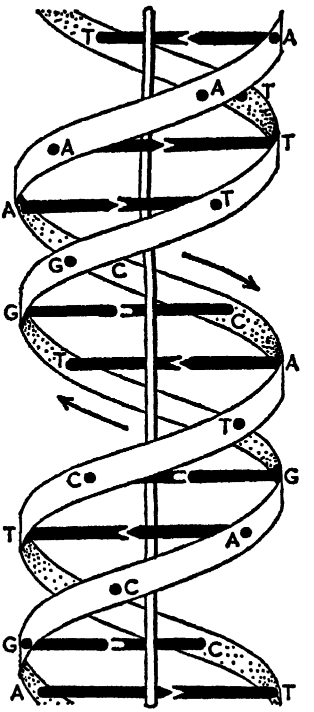

FIG. 3. The actual arrangement of the two nucleotide strands in a double helix, with the bases projecting and linking the two helices as shown.

Furthermore, if adenine is the base on one chain, thymine must be its partner on the other and similarly guanine can link only with cytosine. Because of this pairing off of bases there is sufficient information in a single chain of nucleotides to resynthesise the double helix once more. Thus if we examine a section of a single strand of the helix and find bases in the order adenine, thymine, guanine, adenine, cytosine, we can predict that in similar positions on the other strand we shall find thymine, adenine, cytosine, thymine, guanine. The capacity of one half of a DNA molecule to specify the other half exactly, enables the system to be self-replicating in a way that is essential in a hereditary transmitter and fits in well with what is known of chromosome behaviour during cell division.

Transmission of Genetic Information.

Accepting that DNA is the material of the gene it remains now to examine the nature of the information which it passes from cell to cell and organism to organism. Long before the structure and significance of the DNA molecule was known, geneticists were finding that alterations in a gene, known as a mutation, usually affected a particular chemical reaction and this in turn caused the changes seen in the organism as a whole. The effect was due to the failure to synthesise a necessary enzyme and so the hypothesis "one gene = one enzyme" gathered currency. This view has now been extended to include proteins other than enzymes and it is now certain that specific genes control the synthesis of specific proteins. The DNA of the genes transmits the instructions about protein synthesis to the ribosomes via messenger RNA. In the nucleus, messenger RNA is made with specific base sequences in its molecule by using DNA as the template; thus a group of three adjacent adenine bases in DNA would produce a group of three adjacent urocil bases in the synthesised RNA and this would lead to the specification of phenylalanine at the ribosome as we have seen. Only one of the two strands in the DNA double helix participates in the production of RNA.

Within the nucleus, the nucleolus is believed to play an important part in the synthesis of RNA since its turnover of this material is very rapid. It has been suggested that the nucleolus supplements the RNA prod d by chromosomes and acts as the channel th h which this material is released to the cytopl n. There is now some good evidence which ts to the nucleolus as the source of ribosomal RNA since cells which lose the nucleolus have no ribosomes.

The processes involved in nuclear control and the transmission of information from cell to cell is summarised in the aphorism "DNA makes RNA and RNA makes protein." The system of carrying that information in the base sequences of DNA molecules has become known as the "genetic code." A remarkable landmark in the study of DNA occurred when, towards the end of 1967, Kornberg and his colleagues managed to synthesise a virus DNA in a test tube. The synthesised molecules proved to be capable of infecting bacteria in the same way that the naturally occurring virus would. The DNA was synthesised using an extracted virus DNA molecule as template and attaching nucleotides by means of appropriate enzymes. The newly made molecules were then separated from the template. It can hardly be claimed that this is the creation of life in a test tube since the template was extracted from a living virus. The experiment suggests many possibilities in experimental modification of the genetic constitution of an organism with all the far reaching ethical consequences.

MULTICELLULAR ORGANISATION.

It is axiomatic, if evolutionary theory is accepted, that in the course of very long periods of time there has been a general change in multicellular organisation from the simple aggregation of cells with little individual differentiation, to the highly specialised and differentiated cells and tissues seen in complex animals and plants. It is fascinating to speculate on the environmental variations and internal mechanisms which together produced this result. The problem is so vast, however, that a complete analysis is impossible and even a statement of the sequence of changes is in many cases highly controversial.

Another aspect of becoming multicellular, where the problems offer more hope of analysis, is that the complex organisation must be built up in the lifetime of each animal or plant from the single-celled stage of the fertilised egg. We have already seen how cells can divide repeatedly, handing on self-replicating chromosomes so that each cell is apparently identical. If this were really so then division of the fertilised egg would result in an unorganised mass of cells showing no differentiation. The essential problems in development are: (1) how is the smooth succession of shape changes produced during cell division so that an appropriate and recognisable end product is reached?; (2) how do the cells differentiate during this temporal sequence so that those which form part of the eye, say, are different from those of liver and blood?

Method of Development.

There are some important differences in the method of development in animals and plants. In animals there tends to be a relatively short period

during which the basic structure is produced and after which growth, repair, and replacement may cause adjustment rather than major change. In higher plants, on the other hand, the apical regions of both roots and shoots remain in a permanently embryonic state and add material, which then differentiates, in a continuous process throughout the life of the plant. In spite of these differences—and in any case there are many exceptions—the two main problems in development are essentially similar in both animals and plants.

A great deal of work has been done on animal development since this takes place in a fairly stereotyped way during a short period of time. The fertilised egg of an animal divides in such a way as to form a hollow ball of cells, the blastula, which folds in on itself to produce a two-layered sac, the gastrula. A third layer, the mesoderm, is now added between the two layers, known as ectoderm on the outside, and endoderm on the inside. At this stage much of the animal's basic structure is established. Many aspects of this orderly sequence can be explained in terms of specific adhesive properties of cells, so that a cell will stick to others of the same type but not to unrelated types. Other mechanical properties such as elasticity, particularly in surface layers, are important in maintaining shape and producing appropriate changes during processes when one layer is folded in on another. Why cells should have the different physical properties necessary to produce an integrated whole embryo is not known, but certainly it cannot be thought that every cell has an absolutely fixed constitution and therefore a predetermined role in development. Large parts of developing embryos can be removed in early stages and their places taken by remaining cells so that intact organisms are still produced. One is led to conclude that the surroundings of a cell have a great deal of influence on the way it reacts and that there is a great deal of adaptability in the developing system, especially in its early stages.

Formation of Specialised Tissues.

These points lead us on to the second major question concerning the differences which appear progressively in cells during development so that specialised tissues are ultimately formed. This is essentially a problem in the regulation of gene activity since we know that each cell division produces daughter cells which are genetically identical. It seems likely therefore that instructions are carried on the chromosomes to cope with all requirements of the organism, but that in specialised cells only a small fraction of this full potential is realised. For a long time embryologists have known that egg cytoplasm shows regional differences which make identical nuclei behave differently, and it is thought that regional cytoplasm can in some way control gene activity. Techniques for the transplantation of nuclei in developing frog embryos have been perfected and it has been possible to put a nucleus from an intestinal cell of a tadpole into an enucleate egg. The egg will go on to develop normally even though its nucleus came from a fully specialised cell derived from endoderm. The embryo will form blood and muscle from the mesodermal layer and all the other components of an organism, under the influence of a nucleus which normally would have produced none of these things. One can conclude that all the genes are present, even in the nuclei of specialised cells, but that they have to be placed in a suitable cytoplasmic environment in order to be activated. Similar nuclear transplantation experiments indicate that genes can be " turned off " as well as " turned on " by an appropriate cytoplasmic environment, even though the nuclei come from cells which are so specialised as to stop dividing. The components of cytoplasm which control gene activity are still quite unknown.

A study of cell differentiation and the development of multicellular organisation leads us to the view that, important though the nucleus and its genes are in controlling cell activity, an integrated organism is the result of complex interactions between its constituent cells and between the cytoplasm of those cells and their nuclei.

THE CLASSIFICATION OF ORGANISMS.

It was clear to the biologists of the 17th cent. that animals and plants could be fitted into different groups or species. John Ray, a leading biologist of the day, defined a species as a group of individuals capable of interbreeding within the group. This criterion, with its corollary that a species is reproductively isolated from organisms outside the group, has survived more or less unchanged to the present day. The early workers also saw that some species were very similar to one another while others were obviously dissimilar. Systems of classification based on the similarities and differences were drawn up so that all organisms could be fitted into an orderly scheme and species could be given names in accordance with the scheme. The most famous collector and classifier was the Swede, Linnaeus, who established his reputation in the 1730s. A very large number of animals and plants are known by the names given to them by Linnaeus.

Systematics, as the study of species and of higher groups of classification is called, acquired a new significance after Darwin and the Theory of Evolution. From the biological point of view the most satisfactory classification became one which reflected the evolution of the organisms classified. Such a system, based on the phylogeny or evolutionary history of a group, is called a natural classification. It is not always easy to produce because ancestral types tend to become extinct and the problem then becomes one of reconstructing a whole branching system when only the ends of the branches are known. A great deal of the work on systematics has, of necessity, to be done on museum specimens which may be fossils or material preserved in some way by the collectors. The biological criterion of reproductive isolation cannot be used to define a species when the only available representatives are in a preserved state. In this case the scientist must resort to an assessment of structural differences in an attempt to decide whether two organisms are of different or the same species. It has often been said, unfairly, that such species are subjective concepts which exist only in the mind of the systematist. In recent years computer techniques have been used to compare large numbers of structural differences between groups of animals or plants. Physiological and biochemical characteristics are also becoming part of the armoury of the 20th cent. systematist. All these techniques have led to the realisation that even the species cannot be regarded as a static point in an evolutionary pattern. Some species die out and others arise as conditions in the environment slowly change. This essentially dynamic view of a continually shifting equilibrium between animals, plants and their environment has given rise to what Huxley has aptly called " The New Systematics " in his book of that title.

When the systematist shifts his attention to the higher levels of classification the problems are just as great as at the species level. Different species having features in common can be grouped together into genera, genera into families, families into orders, orders into classes, and classes into phyla. The dividing lines between different groups at all levels is always difficult and in the final analysis somewhat arbitrary since at these levels we do not have any biological criterion such as exists for the species. The evolutionary status of the larger groups is also poorly defined. Many are now recognised to be polyphyletic, which is to say that there are several main evolutionary lines running right through the group.

THE ANIMAL KINGDOM.

The animal kingdom is divided into about 24 large groups or phyla though the number varies between different classifications. Ten of the more important phyla are listed below.

1. **Protozoa.**—Microscopic, unicellular forms of great variety. Some may have more than one nucleus and others form colonies. Many are able to swim by waving hair like flagella or cilia.

Others move by putting out extensions of the body or pseudopodia into which the rest of the body then flows. Protozoa are found in the sea, in fresh water and in the soil. Some are parasitic and cause important diseases in animals and man such as sleeping sickness and malaria.

2. **Porifera.**—Sponges. Very primitive multicellular animals whose cells display considerable independence of one another. Largely marine. The body which may become branched and plant-like is supported by a framework of spicules and fibres. The bath sponge is the fibrous skeleton of certain species.

3. **Coelenterates.**—Hydra, jellyfish, sea anemones, corals. Simple animals which have a body only two cells thick surrounding a gut cavity with a single opening to the outside. Largely marine. Many are colonial. Coral reefs are formed from the calcareous skeletons of these animals.

4. **Platyhelminths.**—Flatworms, which are free living in water, and liver flukes and tapeworms, which are parasitic. A third, solid block of cells, the mesoderm, has been developed between the two layers of cells seen in the coelenterates. A simple gut may be developed and the reproductive system is complex especially in the parasitic forms.

5. **Nematodes.**—Roundworms. The body is smooth and pointed at each end. Some of the most numerous and widespread of all animals. Free living in all environments and parasitic in practically all groups of plants and animals. At the same level of complexity as the Platyhelminths.

6. **Annelids.**—Segmented worms such as earthworms, marine worms and leeches. A system of spaces, the body cavity, is developed in the mesoderm so that movements of the main body of the animal and movements of the gut become more or less independent. Digestive, excretory, circulatory, nervous and reproductive systems are all well developed.

7. **Arthropods.**—A very large, diverse and important group of animals which includes crustaceans such as crabs, shrimps and water fleas; myriapods, such as centipedes and millepedes; insects; and arachnids, such as spiders and scorpions. The arthropods show many of the developments seen in annelids and in addition they possess a jointed, hard exoskeleton. Paired appendages grow out from the segments of the body and form antennae, mouth parts, walking legs, etc. The muscles within the skeleton are able to exert a fine control over the movement of the appendage. In order to grow these animals have to shed the exoskeleton periodically.

8. **Molluscs.**—Mussels, clams, oysters, squids, octopods and snails. Complex body form but somewhat different from annelid–arthropod type. Unsegmented body protected by shell which is variously developed in different types. It forms two valves in mussels and oysters, a spiral structure in snails, is reduced and internal in squids and completely lost in octopods.

9. **Echinoderms.**—Starfish, brittle stars, sea cucumbers, sea urchins, and sea lilies. All marine and all radially symmetrical, usually with five radii. Completely unlike the other advanced, major groups. Circulatory, excretory and nervous systems differently developed. Locomotion and feeding by means of hundreds of tube feet projecting from under surface.

10. **Chordates.**—Sea squirts, Amphioxus, fish, amphibia, reptiles, birds and mammals. Segmented animals which at some stage in their life have gill slits leading from pharynx to the outside and a supporting notochord from which, in all chordates except sea squirts and Amphioxus, is developed a vertebral column or backbone. Those animals with a backbone are commonly referred to as vertebrates, *all* those without as invertebrates. These are obviously names of convenience having no phylogenetic significance since they lump together totally unrelated phyla in one case and align these with a part of a single phylum in the other. The vertebrates have been investigated more completely than any other animals because of their direct structural and functional relationship with man himself. There are five well defined classes which are listed below. The first vertebrates were the fish and from them came the amphibia. The amphibia gave rise to the reptiles and both birds and mammals evolved from different reptilian stock.

(*a*) *Fish*

Cold blooded, aquatic animals breathing by means of gills. Sharks, rays and dogfish belong to a group known as the elasmobranchs characterised by a skeleton made of cartilage. Bony fish, or teleosts, include almost all the fresh water fish and the common marine fish such as cod, mackerel, plaice, herring, etc.

(*b*) *Amphibia*

Cold blooded, more or less terrestrial animals which have to return to water to breed. Five fingered limbs are developed in place of the fins of fish. The egg hatches into a tadpole larva which is aquatic and breathes by gills. At metamorphosis the larva changes into the terrestrial adult which possesses lungs. Some amphibia such as the axolotl may become sexually mature as a larva and so never metamorphose into the adult. The class includes newts, salamanders, frogs and toads.

(*c*) *Reptiles*

Cold blooded and terrestrial. These animals do not return to water to breed because they have an egg with a relatively impermeable shell containing the food and water requirements of the developing embryo. There is no larval stage. Present day reptiles such as lizards, snakes and crocodiles are all that remains of a tremendous radiation of dinosaur-like creatures which occurred in the Mesozoic (F35).

(*d*) *Birds*

Warm blooded and adapted for aerial life. The characteristic feathers act both to insulate the body against heat loss and to provide the airfoil surfaces necessary for flight. The birds are an astonishingly uniform group and show less diversity of structure than much lower classification categories (*e.g.*, the teleosts) in other classes. The relationships of the 19,000 or more species of bird are difficult to establish because of this uniformity. It is clear that the flightless forms such as the ostrich are primitive and that the penguins are also in a separate category but the typical modern birds are classified in a large number of rather arbitrary orders. About half of all the known species are placed in one enormous order called the Passeriformes or perching birds.

(*e*) *Mammals*

Warm blooded animals which have been successful in a tremendous variety of habitats. Mammals are insulated from the environment by the characteristically hairy and waterproofed skin. They are, with two exceptions, viviporous which means that their young are born alive and in typical mammals at an advanced stage of development. In the marsupials of Australia the young are born at an early stage and transferred to a pouch where they develop further. The two exceptions referred to are primitive monotreme mammals known as the duck-billed platypus and spiny ant-eater and these animals lay eggs. The young of mammals are suckled by means of the milk producing mammary glands. The mammals include aquatic whales and dolphins, hoofed ungulates, flesh eating carnivores, rodents and insectivores, the aerial bats, and the tree climbing primates to which man himself belongs.

THE PHYSIOLOGY OF ANIMALS.

Some basic features of cell organisation have already been dealt with, and in unicellular animals all life processes, such as respiration, movement,

growth and reproduction, proceed in the single cell. However in multicellular animals cells are of various types, constituting distinct tissues and organs which perform special functions in the body. Although each cell has its own complex metabolism there must be co-ordination between cells forming special tissues and between the tissues which form the whole organism in order for the body to function efficiently. The study of these functional interrelationships at the tissue and organism level of organisation is the province of the physiologist.

1. Movement, Fibrils and Skeletons.

(a) **Muscles.**—The prime movers in almost all animal movement are large protein molecules in the form of microscopic fibrillar threads. In some way not yet fully understood these fibrils can convert the chemical energy stored in the high energy phosphate bonds of ATP into mechanical energy. In the long, thin cells forming the muscles of animals, it has been discovered that there are two sets of fibrils, one formed of a protein called myosin, the other of actin, arranged in a regular, interdigitating fashion. When the muscle contracts the fibrils slide into one another so that, although the fibrils themselves do not change in length, the muscle as a whole develops tension and shortens. This, the Sliding Filament Theory of Muscle Contraction, was formulated in 1953 by A. F. Huxley, H. E. Huxley and J. Hanson. Fine bridges extend from the myosin fibrils to attach on to the actin and it is here that the conversion of chemical to mechanical energy goes on.

(b) **Skeletons.**—In order for muscles to work effectively it is necessary for them to operate in some sort of skeletal system. Contraction but not relaxation is an active process; muscles must be arranged in antagonistic pairs so that one muscle can extend the other. A skeleton also provides a system of levers so that the muscles can do work against the environment in an efficient manner. A simple type of skeleton found in fairly primitive animals is the hydrostatic system of coelenterates and worms. Here the animal can be thought of as a fluid filled bag or tube which can change shape but whose volume remains constant. By contraction of circular muscles the tube will become long and thin and conversely contraction of longitudinal muscles makes the tube short and fat. Examination of an earthworm will demonstrate how alternating waves of activity of this type passing from head to tail can move the animal over the ground. The earthworm shows an advance over the simplest systems because the hydrostatic tube is broken up into small units by the segmentation of the body. This makes local responses possible. The next advance to be seen is the development in animals such as arthropods and vertebrates of a firm skeleton to which muscles are directly attached. The skeleton can then be used to support the body and to engage the environment. It seems to matter little whether an endoskeleton (vertebrates) or exoskeleton (arthropods) is developed since in both cases a tremendous radiation of fins for swimming, legs for walking and wings for flying can be seen. However in other respects these two types of skeleton show significant differences. The exoskeleton for example offers more protection than the endoskeleton while apparently setting an upper size limit. All the really big animals have endoskeletons.

(c) **Cilia.**—Fibrillar systems are also seen in the fine hair-like cilia which project from the surface of some cells. Cilia are important in a number of ways. They are the organelles of movement in many Protozoa, they are used to produce water currents past the bodies of some aquatic animals, and they are of great importance in moving fluid within the body of almost all animals. They beat in a regular fashion, the effective stroke being accomplished with the cilium held straight out from the surface and the recovery stroke with the cilium flexed at the base.

Cilia possess the same structure no matter where they come from. In transverse section eleven fibrils can be seen which run the whole length of the organelle. Two of the fibrils are single and situated centrally while the other nine are double fibrils arranged in a circle around the periphery of the cilium. Work is still going on in this field, but it has been suggested that the peripheral fibrils are contractile and cause the cilium to bend. The function of the central fibrils is unknown.

2. Nutrition and the Alimentary Canal.

All animals must take in and digest food materials. As well as water they require complex organic substances, proteins, fats and carbohydrates, together with small amounts of salts and vitamins. These materials are obtained by eating the dead bodies of plants and other animals. They are taken into the alimentary canal and there broken down or digested by enzymes into simpler, soluble amino acids, sugars and fatty acids. These substances are absorbed and distributed to various parts of the body where they are used in cell metabolism (F19, 20) or stored for future use.

(a) The Size of Food—Microphagy and Macrophagy.

Many animals, called macrophagous feeders, take in relatively large masses of food. Some such as frogs and snakes swallow their food whole, but many break it up first. Arthropods have modified appendages arranged round the mouth for cutting, some molluscs have a rasp-like radula with which to scrape off particles, and many mammals break up their food with jaws and teeth. The teeth are usually well adapted to the type of food. Carnivores have large, sharp canines, premolars and molars with which to tear the flesh of the prey, fish eating seals have small peg-like teeth to grip the fish and herbivorous ungulates have flat grinding teeth with which they break up hard plant material.

In contrast, microphagous feeders collect small particles of food material from the environment by continuous filtration. In bivalve molluscs and many marine worms water currents are produced by beating cilia. Food is trapped within the confined space through which the water flows by means of a plentiful supply of sticky mucus in the filtering region. Some crustacea use fine hairs to sieve off food material, often from water currents created by the swimming movements. The most startling of filter feeders is the whalebone whale. As the whale swims forward a stream of water flows in at the front of the mouth and out at the sides via sheets of whalebone which filter off the organisms on which the animal feeds. Though macrophagy seems to favour the attainment of larger size there are exceptions! Another type of particulate feeding is seen in those animals which eat deposits of detritus as do many worms. Finally some animals take in only soluble food materials. These fluid feeders include internal parasites like the tapeworm which absorb substances over the surface of the body, and insects such as the aphid with sucking mouth parts.

(b) Reception and Storage.

The food now passes into the alimentary canal which may be fairly simple, straight tube but more usually becomes long and coiled. The gut tube may be divided into several functional components though the divisions must not be regarded as absolute. The first section is usually involved in the selection, by taste, smell and texture, and the reception of food. A lubricating mucus, together with some digestive enzymes, may be added at this stage from glands such as salivary glands. A large crop for food storage occurs in animals as diverse as insects and birds but in mammals this region remains as a simple tube called the oesophagus.

(c) Mixing, Grinding and Early Digestion.

Waves of contraction in the muscles of the gut move the food onwards. This peristaltic action delivers the food to a region known variously in

different animals as the stomach, gizzard or gastric mill. Here the further disintegration and mixing with enzymes is accomplished in many forms simply by contraction of the muscle of the stomach wall. Stones may assist the action in the gizzard of birds for example, and more bizarre modifications are seen in some crustaceans and molluscs. In the former there is a complicated gastric mill with grinding surfaces, teeth and a filter, and in the latter a long rod, called the crystalline style, is rotated by ciliary action against a hard pad on the opposite wall of the stomach. In the ruminating mammals such as sheep and cattle the stomach is divided into four chambers. The function of the first two of these is to mix food with a bacterial culture which exists in this region and to regurgitate the cud for further grinding. The bacteria break down plant cell walls and so benefit the host which cannot deal unaided with the main component known as cellulose. The final two chambers of the ruminant stomach are more typical in function.

A variety of digestive enzymes are released into the stomach region. Carbohydrates, fats and proteins are all broken down to some extent. The main enzyme in the stomach of vertebrate animals is a proteinase which works under acid conditions.

(d) Final Digestion and Absorption.

The finely divided food now passes on to the intestine where digestion continues, using enzymes liberated in the preceding region, or under the action of new enzymes released from intestinal glands. In the vertebrates the pancreas secretes a number of enzymes acting on all types of food material, one of the most important being the protein-breaking trypsin. The pancreatic secretion is liberated into the anterior end of the intestine known as the duodenum and operates in an alkaline medium.

Soluble products of the process of digestion are absorbed through the wall of the intestine into the blood stream. Blood vessels carry the food material to the liver where it is put to use in the animal's metabolism or stored as liver glycogen. The surface for absorption is increased by tremendous folding of the intestine interior, seen as finger-like villi in higher vertebrates or as the so called spiral valve in some fish.

(e) Processing of Waste Material.

The undigested remains of the food now pass through the most posterior regions of the alimentary canal known simply as the hindgut in many forms or as the colon and rectum in others. A major function of this region, particularly in terrestrial animals, is the removal of water so as to conserve this vital material. In the rectum the faeces are formed and stored before being eliminated from the body.

3. Respiration. Gills, Lungs and Tracheae.

The oxidations which consume oxygen and produce carbon dioxide go on at the cellular level as explained earlier (F20). All living cells respire and remain alive only if supplied with oxygen. In a multicellular body, however, many cells are remote from the oxygen of the environment and the need arises for an efficient respiratory system by which oxygen can be taken up and carbon dioxide released. In addition a circulatory system is necessary to transport the oxygen to and from the respiring cells.

(a) Simple Gas Exchange Systems.

Animals such as protozoa which because of their size have a high surface area to volume ratio do not need special structures for gas exchange. Diffusion over the whole body surface ensures an adequate supply of oxygen. Much larger animals such as earthworms also find it possible to rely on diffusion alone, partly because their consumption of oxygen is fairly low, and partly because their bodies are permeable all over. For various reasons most animals restrict the permeability of the outer layers of the body and under these conditions special respiratory areas have to be developed.

(b) Gas Exchange in Water.

Aquatic animals, except those such as whales breathing at the surface, have to obtain their oxygen from the supplies which are dissolved in the water. This presents several problems because water is a dense medium, there is not a lot of oxygen in solution, and its diffusion rate is low. For these reasons there is a surprising functional uniformity in gill systems and they are very different from lungs. Gills are fine, finger-like processes with a good blood supply which are held out in a water stream. The water current is brought very close to the gill filaments so that the length of diffusion pathway for oxygen is minimal. There is a "counter current" flow of water and blood so that the water containing most oxygen comes into contact with the blood just leaving the gill. This ensures that most of the oxygen can be transferred from water to blood through the thin gill cells. The efficiency of "counter current" systems is well known to the engineer but they were invented by aquatic animals long before they were by man. These features can be seen in the gills of molluscs, crustacea and fish. The pumping devices which maintain the water currents also operate economically. Flow is maintained in crustacea by appendages modified to form beating paddles, in many molluscs by ciliary movement, and in fish by the operation of a double pump in mouth and opercular cavities. In almost all cases there is a continuous current over the gills, the water coming in one way and going out another. Thus the animal avoids reversing the flow with the consequent waste of energy in accelerating and decelerating a large mass of water. Fish, for example, take water in at the mouth and force it out through the gill slits (sharks) or operculum (teleosts).

(c) Gas Exchange in Air.

Air breathing animals do not encounter these problems since the medium is less dense, contains a great deal (20%) of oxygen and diffusion rates are high. Lungs are therefore in the form of sacs whose walls are well supplied with blood. The area of the walls may be increased by folding so that the lung becomes spongy and full of minute air spaces called alveoli where the gas exchanges goes on. Only the main airways receive fresh air as the lung expands; oxygen is renewed in the alveoli by diffusion. Ventilation of the lung is accomplished by a tidal flow of air in and out of the same tubular opening known as the trachea. The actual ventilating mechanism varies in different animals. In the amphibia for example air is forced into the lungs when the floor of the mouth is raised with the mouth and nostrils shut. The lungs are emptied by elastic recoil and by lowering the floor of the mouth. Higher vertebrates use a costal pump which changes the volume of chest and lungs by movements of the ribs. This change in volume is further assisted in mammals by the diaphragm, a sheet of muscle which lies beneath the lungs and separates thorax and abdomen. In many animals sound producing organs are associated with the lungs and trachea. The larynx is a vocal organ in frogs, some lizards, and most notably mammals. In birds voice production takes place in the syrinx situated further down at the base of the trachea.

A completely different gas exchanging system is seen in insects. Branching tubes, known as tracheae, run throughout the body and carry oxygen directly to the cells without the intervention of a blood system. The tracheae communicate with the outside world via a series of holes called spiracles. Although the main tubes may be actively ventilated, diffusion in the system accounts for a large part of the movement of oxygen between the outside world and cells.

4. Circulation.

In simple, small animals there is no blood system and dissolved oxygen, nutrients and other materials move about the body solely by diffusion, assisted to a certain extent by streaming movements of protoplasm within the cells. In larger animals a transport system is necessary to convey materials about the body and in many, but not all, it is in the form of a blood system. Blood systems are of two types, closed and open.

(a) Open Systems.

In an open circulatory system blood is pumped from the heart into a few major arteries but these very quickly give way to large tissue spaces or sinuses so that the tissues and organs of the body are directly bathed in blood. Blood flows slowly from the sinuses back to the heart. Both molluscs and arthropods possess an open system. The heart in most arthropods is a long, thin tube in the dorsal part of the body, pumping blood towards the head. Auxiliary muscles may be attached to the heart to pull it out and refill it after the pumping cycle. Mollusc hearts on the other hand are of the chambered type, with thin walled auricles receiving blood from the gills and pumping it to a more muscular ventricle. The ventricle in turn contracts to pump blood to the body. In squids and octopods two auxiliary hearts are seen, receiving blood at low pressure from the body and pumping it through the gills and thence to the main heart.

(b) Closed Systems.

In a closed system blood is pumped round the body in a branching network of arteries, and comes into contact with tissues and cells via very thin walled vessels called capillaries. Substances diffuse into and out of the blood through capillary walls. From capillaries, blood enters the veins and so returns to the heart. Blood flow in the tubes of a closed system is much more brisk and blood pressures tend to be higher than in an open system. In annelids the closed system is fairly simple with a vessel above the gut in which blood moves forward connecting to one below in which blood moves backwards. The blood is pumped by peristaltic contraction of the vessels and this system must be regarded as the precursor of a localised pump. Simple hearts are in fact seen in some annelids.

In vertebrates a well defined heart is always present, situated ventrally at the level of the forelimbs. In fish there is a single auricle and ventricle and the latter pumps blood directly to the gills. From the gills the blood is collected into a dorsal aorta which then branches to serve the rest of the body. Associated with the development of lungs and loss of gills in the tetrapods, we see a progressive modification of this simple pattern. The most posterior gill vessel is taken over as the lung or pulmonary artery and slowly a completely separate circuit evolves. This involves the division of the single heart into right and left sides, the former pumping blood to the lungs and the latter to the body. In the birds and mammals where the division is complete the system can be seen to be functionally satisfactory. Blood flows along the following route: left auricle to left ventricle, to body, to right auricle, to right ventricle, to lungs, to left auricle, and so on. Thus blood charged with oxygen in the lungs returns to the heart before being pumped to the body. In the lower tetrapods, division of the heart is incomplete and considerable interest centres on the function of these apparently imperfect systems. Amphibian hearts have two auricles but only a single ventricle. In spite of this, evidence is accumulating to show that blood from the lungs and body is not mixed as it passes through the ventricle. A further complication in amphibia is due to the moist skin also being used for gas exchange. Some oxygen is thus contained in blood returning from the body. Reptiles show a further advance in that the ventricle is almost completely divided into two. The system appears still to be functionally inadequate because one of the major arteries to the body leaves from the deoxygenated side along with lung vessels.

(c) Function of the Blood.

Most of the materials transported by the blood such as nutrients, waste materials and hormones are carried in solution in the plasma. The respiratory gases, oxygen and carbon dioxide, are present in greater quantity than would be possible if they were in simple solution. Carbon dioxide is carried in the form of bicarbonate and oxygen combines with blood pigment. The best known blood pigment is haemoglobin which is found in a variety of animals and gives the red colour to blood. When oxygen is present in high concentration, as it is in the lungs, combination occurs to give oxyhaemoglobin. If the concentration of oxygen is low, as it is in the tissues, dissociation occurs and oxygen is given off leaving reduced haemoglobin. Carbon monoxide will combine more readily than oxygen with haemoglobin so that in carbon monoxide poisoning the blood cannot transport oxygen. The haemoglobin of vertebrates is contained in high concentration in red blood corpuscles. The amount of haemoglobin and, hence, oxygen carried is greater than if the pigment is not in corpuscles. In mammals the oxygen carrying capacity of blood is thirty times that of a similar quantity of water. Other blood pigments are the blue haemocyanin found in crustacea and molluscs, and the violet haemerythrin found in some worms. Also present in the blood are various types of white corpuscle which are part of the defence mechanism of the body and ingest invading bacteria. Special blood proteins such as fibrinogen, causing clot formation, and antibodies effective against foreign substances occur in the plasma.

5. Excretion, Ionic Regulation and Kidney Tubules.

As the chemical reactions included under the term metabolism proceed, so numerous waste products accumulate. The most important of these are compounds containing nitrogen, such as ammonia, urea and uric acid, arising from the use of protein as an energy source. In terrestrial animals they are removed from the blood by the kidney. The basic unit of a kidney is the tubule; in worms these tubules are not concentrated into a solid kidney but occur, a pair in every segment, right down the body. The kidney tubule begins with an end sac, corpuscle or funnel which is closely associated with the body cavity or the blood system. Fluid is filtered from the body cavity or blood into the corpuscle whence it passes to the tubule proper. During passage down the tubule, useful materials are reabsorbed through the tubule cells into the blood whereas unwanted materials remain and pass to the outside world.

Although it is usual to think of kidney function being primarily one of nitrogenous excretion, it is quite common to find that in aquatic animals the kidneys are hardly used for this purpose. In these animals the tubules are primarily concerned in regulating the salt and water levels in the body, nitrogenous wastes being eliminated by diffusion through any permeable surface. In fresh water for example all animals have osmotic problems since the body fluids have a much greater osmotic pressure than the environment. Water tends to enter the body and salts tend to leave. Fresh water animals produce large quantities of very dilute urine, filtering off a lot of blood plasma into the tubules but reabsorbing all wanted materials including the invaluable salts. Fresh water crustacea, molluscs and fish all possess tubules of different morphology which show very similar functional properties.

Different environmental conditions impose different demands on the osmotic and ionic regulating machinery. In very dry conditions, such as in deserts, it is obviously of advantage to reabsorb as much water from the tubule as possible. All animals do this but it is interesting that only birds and mammals have discovered the secret of so concentrating the urine that its salt concentration is higher than that in the blood. This is done by means of a hairpin-like loop in the tubule called the Loop of Henle, another example of a counter current device.

6. Co-ordinating Systems.

Overall co-ordination of the animal's body, so that it functions as a whole and reacts appropriately to environmental changes, is largely the province of two systems, one chemical or hormonal, the other nervous. In one respect these are systems for homeostasis, that is for preserving the *status quo*, in spite of considerable environmental fluctuation. Paradoxically they can also initiate change as, for example, one can see in the daily repertoire of complicated behaviour patterns produced by almost any animal.

(a) Nervous Systems.

(i) *Sensory Information.*

Before appropriate reactions can be produced to any stimulus it is necessary to measure its intensity, position, duration and, most important, character. This is done by sense organs which are usually specialised to receive stimuli of a single modality or character. Thus photoreceptors detect light, mechanoreceptors detect mechanical disturbance and chemoreceptors detect specific chemicals. In all cases the sense organs produce a message about the stimulus in the form of nerve impulses (see F23–Cell Membrane) which travel up the nerve from the sense organ to the rest of the nervous system. Change of stimulus intensity is usually signalled as a change in frequency of nerve impulses. The position of the sense organ which is active indicates the position of the stimulus within or without the body. The duration of the repeated discharge of nerve impulses indicates the duration of the stimulus.

(ii) *Simple Networks.*

The simplest type of nervous system is the network of interconnected nerve cells (neurones) found in the coelenterates. Branching processes of the nerve cells communicate with neighbouring processes at special regions called synapses (F23). Quite complicated behaviour is possible even with this relatively simple system. If a sea anemone is prodded violently it will close up equally violently, showing that activity has spread throughout the network. If it is tickled gently it will respond with local contractions around the site of stimulation. The movements of feeding and locomotion are very delicately performed at appropriate times.

(iii) *Central Nervous Systems.*

In the majority of animals all the nerve cells tend to become collected into a solid mass of tissue referred to as a central nervous system (C.N.S.). Within the mass the nerve cells are interconnected via synapses in the same way as in a nerve net. The connexions with sense organs and muscles are made via long processes called axons. Numbers of axons are usually bound together with connective tissue to form a nerve trunk. In annelids and arthropods the C.N.S. is seen as a ventral cord lying beneath the gut with a swelling or ganglion in each segment of the body. In molluscs, the ganglia are usually more closely grouped around the oesophagus, with the possible provision of a pair of ganglia further back in the viscera. Vertebrates possess a dorsal nerve cord which is uniform in diameter and not ganglionated, though nerves emerge from it in a segmental fashion. The segmental nerves arise in two separate bundles or roots. The dorsal root is made up entirely of sensory nerves conveying information to the C.N.S. The ventral root consists of motor nerves which convey nerve impulses to the muscles of limbs and alimentary canal together with other effector organs such as glands.

(iv) *Reflexes.*

A reflex, in which stimulation of a sense organ or sensory nerve results in the almost immediate contraction of a muscle, is the simplest type of C.N.S. activity. Reflexes have been studied in all animals but the best known ones can be seen in frogs, cats, dogs, and sometimes humans. The very simplest is the stretch reflex, in which a stretched muscle is made to contract by activity coming into the C.N.S. from stretch receptors in the muscle. The activity is relayed directly to the motor neurones of the muscle concerned, making them active and thus causing the muscle to contract. This reflex is monosynaptic, *i.e.* there is only the single synaptic connexion between sensory nerve and motor neurone. The knee jerk in humans is a stretch reflex, the stretch being caused by hitting the muscle tendon as it passes over the knee. Much of the recent work on reflexes has been done on this simple system, notably by Eccles. The flexor reflex, which is seen as the sudden withdrawal of a limb from any painful stimulus, is more complicated. Although the stimuli may vary, the withdrawal response is always accomplished by contraction of flexor muscles which bring the limb in towards the body. The reflex is polysynaptic, *i.e.* several intermediate neurones connect the sensory nerves through to the motor neurones. More complicated still is the scratch reflex in which an animal is made to scratch its flank in response to an irritation or tickling in that region. This reflex demonstrates some of the more involved properties of the C.N.S. For example a dog will continue to scratch for a time after the tickling has stopped, so that the C.N.S. must continue to be active in the absence of sensory stimulation. This has been called after-discharge.

(v) *The Brain.*

The C.N.S. functions in a more complicated way than is suggested by study of the reflexes and most of these higher activities are co-ordinated by the brain. A greater condensation of neurones is seen at the front end of t[illegible] C.N.S. of all animals because of the larger nu[illegible] of sense organs in that region. Brains, which [illegible]ome the dominant part of the C.N.S., can be se[illegible] in arthropods, molluscs and vertebrates. The close association with sense organs is illustrated by the vertebrate brain which is divided into three regions: (*a*) forebrain (nose), (*b*) midbrain (eye) and (*c*) hindbrain (ear and taste). However, the brain is much more than a relay station for these stimulus modalities and it receives information from other parts of the body via the spinal cord. All this information is correlated and activity patterns initiated and transmitted to appropriate regions. In lower vertebrates, the roof of the midbrain (the optic tectum) is the important correlation centre and its effectiveness has been well established in studies on instinct and learning in fish. Another region of the brain of importance in all vertebrates is a dorsal upgrowth of the hindbrain called the cerebellum. This is a motor co-ordinating centre which ensures that all activities are performed in a smooth and well balanced way by the muscles and limbs of the body. In reptiles, the forebrain begins to take over the correlation role and in mammals this development reaches its peak in the cerebral cortex. In man the cortex overshadows the rest of the brain and contains some 1000,000,000 neurones. It is easy to see the magnitude of the problem of understanding a system of this complexity. The bee's brain with far, far fewer cells can initiate complicated behaviour such as the hive dances. The possibilities offered by the human cortex seem vastly greater, though they are often realised in ways which give cause for concern. At the moment it would be quite impossible to build a computer with the properties of the human brain. To do this in the future would depend on major advances in computer technology and even greater advances in the knowledge of central nervous systems.

(b) Hormonal Regulation.

Many aspects of an animal's metabolism are regulated, not by the nervous system, but by specific chemical signals known as hormones which are circulated in the blood stream. Growth, carbohydrate metabolism, salt balance, activity of ovaries and testes and their associated structures, and colour change are all regulated in some way by hormones. The substances are secreted by endocrine glands or ductless glands as they are often called. The important endocrine glands in vertebrates are the thyroid, parathyroid, adrenal, pancreas, the sex glands, and the pituitary.

In the past the endocrine and nervous systems were regarded as exerting an independent control in slightly different functional areas of the body. It is clear now that the integration of the two systems is much greater than was formerly envisaged and in vertebrates is accomplished through the pituitary gland. Secretions of this gland regulate almost all other endocrine glands and the secretions of the pituitary are either produced in the C.N.S. with which it is directly connected or are controlled by C.N.S. secretions. An astonishing, parallel development of other neurosecretory systems, such as those of the pituitary, has been found in a variety of animals and in all types the neurosecretory organ complex is the dominant endocrine gland of the body. In crustacea the so

called X organ complex found within the eyestalk, and in insects neurosecretory cells connecting to the corpora cardiaca glands, occupy the functional position of the vertebrate pituitary. They all regulate growth, metabolism and reproductive physiology, either directly or through the mediation of other endocrine glands.

7. Animal Behaviour.

In discussing the nervous system we have already dealt with simple mechanisms such as the reflex. Very much more complicated are the instinctive and learned patterns of behaviour which are studied by animal psychologists and ethologists such as Lorenz and Tinbergen.

(a) Instinct.

Instinct is inborn behaviour which does not have to be learnt and is usually performed in a stereotyped way. For example a gull will retrieve an egg taken out of its nest by shovelling it back with the underside of its beak. The gull will never replace an egg in its nest in any other way, for example by using a wing or leg, and once it has begun a retrieval it will usually continue the movements back to the nest even though the egg is taken away. An instinctive behaviour pattern is triggered off by a particular stimulus or "releaser" which may be a very small part of the total environment. A male stickleback will attack a very crude model with a red belly but will not attack an exact model without it. The red underside appears to be a much more important stimulus than general shape. A particular instinctive pattern cannot always be elicited and the reaction of an animal very largely depends on when the behaviour was last produced. The longer the time that elapses, the easier it is to trigger off the instinctive pattern until eventually it may appear in the absence of an appropriate set of environmental circumstances.

(b) Learning.

Learning is that behaviour acquired during the organism's lifetime as a result of experience. Evidence of learning has been seen in many animals from worms upwards though, as might be expected, the more complicated types of learning are found only in those animals with elaborate nervous systems. A simple type of learning is seen when an animal, upon repeated exposure to a stimulus, gradually decreases the normal response which is usually one of flight, until eventually the response may disappear completely. This process is called habituation. More complex are the conditioned reflexes, which were first discovered by Pavlov. In these an animal can in some way connect a conditioned stimulus such as a bell, with an unconditioned stimulus such as meat, so that eventually it salivates when the bell is rung. Trial and error learning of the type needed to be successful in running a maze is more complicated still. In this there is a retrospective element because the reward at the end of the maze comes after all the responses. Many animals can run mazes but the white rat has been extensively used in experiments of this nature and there is a huge literature on this one animal. A final category of learning can be called insight learning; in this an animal shows evidence of resolving a new problem without trial and error. This type of learning involves the perception of relations between different parts of the environment and though there may be examples in arthropods and molluscs the clearest evidence of it is seen in the behaviour of birds and mammals.

8. Reproduction.

A single animal may live for a short or long time, but eventually it dies, and the continuance of the species is dependent upon reproduction. Some protozoa, such as *Amoeba*, reproduce asexually by the simple division of the cell to produce two new individuals. Asexual reproduction also occurs in some coelenterates, such as jelly-fish, in which there is an alternation of sexual and asexual generations. However, the vast majority of animals only reproduce sexually. This involves the fusion of two cells, the gametes, produced by adult individuals, and each zygote thus formed develops into an individual of the next generation. The gametes are of two kinds, the large, spherical, immobile ova produced by the female gonad or ovary and the much smaller motile sperms produced by the male gonad or testis. The motility of the sperms helps them to reach the passive ovum, which contains food reserves to support the early development of the embryo.

Worms.—The flat worms, particularly parasitic forms, have complicated life cycles, and many are hermaphrodite, *i.e.*, each individual has both male and female organs. Cross-fertilisation usually occurs, the sperms from one worm being introduced into the female duct of another. The round worms are unisexual, and internal fertilisation also occurs. Of the annelids the polychaete worms are unisexual, but the ova and sperms are shed into the sea, where fertilisation takes place. However, *Lumbricus* and the leeches are hermaphrodite, cross-fertilisation takes place and the eggs are laid in cocoons.

Arthropods.—Many crustacea are unisexual, though the sedentary barnacles are hermaphrodite. Internal fertilisation may occur, but in the crabs and crayfish pairing takes place and the sperms are deposited on the tail of the female. When the eggs are shed they become fertilised and remain attached to the abdominal appendages. Most crustacea have motile larval stages into which the eggs first develop. In *Daphnia*, the water-flea, parthenogenesis sometimes occurs, *i.e.*, the eggs develop without being fertilised. The sexes are separate in the arachnida and there are usually no larval stages except in the primitive king-crabs. The insects are also unisexual, and the fertilised eggs are laid after copulation. In some, *e.g.*, dragon-flies, an immature nymph similar to the adult is formed, but in flies, beetles, moths, and many others the egg hatches into a larval form. This then develops into a pupa, from which the final adult or imago is produced. In the social ant's nest the workers are sterile females with large heads, reduced eyes, and no wings. The males and queens are winged, and insemination of the latter occurs during the "nuptial" flight.

Molluscs and Echinoderms.—Most lamellibranchs are unisexual, although some species of scallops and oysters are hermaphrodite. There are motile larval forms, and in the swan mussel, *Anodonta*, the larvae develop in the mantle cavity of the parent and when liberated become attached to the gills or fins of fish, where they remain parasitic for some time. Some gasteropods are unisexual, but the slugs and snails are hermaphrodite. In the latter cross-fertilisation occurs, the two approaching snails being stimulated to copulate by firing small sharp darts of calcium carbonate into each other. The echinoderms are unisexual, and fertilisation takes place in the sea. The egg first develops into a ciliated larval form.

Vertebrates.—The sexes are always separate in the vertebrates. In some cartilaginous fish, *e.g.*, dogfish, internal fertilisation occurs and the eggs are laid in protective sacs. In contrast, the bony fish shed ova and sperms into the water, where fertilisation takes place. Although pairing may take place in the amphibia, fertilisation occurs in water, and there is usually an aquatic larval stage. The reptiles, birds, and mammals are independent of water for fertilisation, as copulation takes place and the sperms from the male are introduced directly into the female. Most reptiles and all birds lay eggs with hard shells. Development of the embryo in marsupial mammals begins in the female uterus, but is continued in a ventral pouch which surrounds the teat of the mammary gland. In the two living species of monotreme mammals the eggs are incubated in a similar pouch. Finally, in the eutherian mammals the embryo develops in the female uterus and is born at an advanced stage.

Diversity of Sexual Reproduction.— This brief survey will give some idea of the diversity of sexual reproduction in animals. External fertilisation is

very much a matter of chance, and large numbers of gametes are produced which offset the great losses of gametes and embryos that this method involves. Internal fertilisation is more certain, and is also independent of external water—an important factor in land animals. In vertebrates particularly there is increase in the care of the young by the parents, involving the development of characters of behaviour as well as those of structure. Some fish lay their eggs in holes or nests which are protected by the male. Similarly, a few frogs build nests, while others carry the eggs about. The eggs of birds require a constant high temperature for their development, and they are usually incubated by the parents. After hatching the young are fed and guarded by the parents until they can leave the nest and fend for themselves. In the eutherian mammals the embryos are attached to the uterus wall by the placenta, *via* which food materials pass from the mother. The period of gestation is long, and after birth the young are supplied with milk from the mother until they are weaned and can feed themselves. Another feature in mammals is the period of "childhood" during which they play and learn and are protected and fed by their parents. The internal fertilisation, internal development, and care and protection of the young after birth which is so conspicuous in the higher vertebrates results in the reduction of losses during the vulnerable embryonic and young stages, and in consequence relatively few progeny are produced by a pair of individuals.

CLASSIFICATION OF PLANTS.

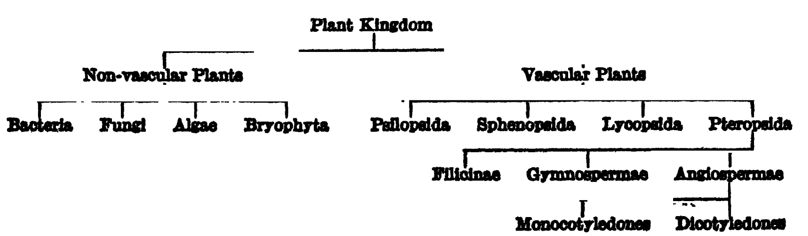
There are various ways in which the main classes of the plant kingdom can be grouped, but a simple, up-to-date arrangement is given in the chart. Vascular plants are often known as the *Tracheophyta* because they all possess woody conducting elements. These are absent in non-vascular plants, and the bacteria, fungi, and algæ are often called *Thallophyta*, *i.e.*, they have a relatively simple plant body or thallus. Many of the bryophytes also possess a thallus, but in some there is a stem bearing leaves, although a true vascular system is absent. Many thallophytes are aquatic, whereas the tracheophytes are mostly land plants in which the development of woody tissues can be related to the attainment of the land habit as the plant kingdom evolved. However, the chart should not be taken as indicating the evolutionary relationships of the various groups. It is more a convenient arrangement which reflects the relative complexity of the plant body.

Bacteria.—This is a vast group of minute organisms of very simple structure. They are spherical or rod shaped and may exist as separate cells, some species being motile, or as long chains or irregular masses. Their minute size makes the elucidation of their structure very difficult. There is a wall of complex composition, and cytoplasm which contains glycogen and fat. Electron-microscope studies have revealed the presence of structures which appear to consist of nuclear material. Multiplication is by simple division, which may take place very rapidly. For example, *Bacillus subtilis* can divide every 20 minutes, so that in 8 hours a single cell may give rise to 16 millions. Recent research indicates that a sexual process may also occur. Bacteria can survive unfavourable conditions by producing a resistant spore within the cell. They do not possess chlorophyll, though a few are pigmented. Most obtain their food already formed, and are thus either saprophytes or parasites. The saprophytic bacteria occupy a vital position in the living world. They are responsible for most of the decay of dead organic matter, and it has been truly said that without them the surface of the earth would soon become completely covered with the dead bodies of animals and plants. Bacteria also play a vital part in the circulation of nitrogen in nature. By breaking down organic material, ammonia is released and ammonium carbonate is formed in the soil. This is oxidised by other bacteria to form nitrates, which can be absorbed by plants again. Yet other bacteria can "fix" atmospheric nitrogen, and one species, *Rhizobium leguminosum*, occurs in the root nodules of plants such as clover and lupins. These plants are often grown on poor soils and ploughed in, thus improving the fertility of the soil. The parasitic bacteria are also of great importance, as they are responsible for many diseases of plants, animals, and man. (*See* P7(1).)

Fungi.—This is a large group of plants, none of which contain chlorophyll. Hence, like the bacteria, they are either parasites on other living plants and animals or saprophytes which live on dead organic matter. Some are unicellular aquatic plants, but many have a body called a mycelium composed of many branched threads or hyphæ. In the higher fungi (*e.g.*, toadstools, bracket fungi, and puff-balls) complex reproductive structures are formed. All fungi produce spores. In the aquatic species these may be motile, but the majority form minute, airborne spores. The spore output is often very great, and a single mushroom may produce 1,800 million spores. Some fungi are serious diseases of crop plants, such as potato blight and wheat rust.

Algæ.—These are essentially aquatic plants which contain chlorophyll. They range from microscopic forms to the large seaweeds. The green algæ (*Chlorophyceæ*) live mostly in fresh water and may be unicellular, motile or non-motile, or filamentous, though a few found in tropical seas are more complex. The brown algæ (*Phæophyceæ*) are mostly seaweeds which possess a brown pigment, fucoxanthin, which masks the green chlorophyll. They include the bladder-wracks (*Fucus*) and kelps (*Laminaria*) of our coasts and the seaweeds which form dense floating masses over hundreds of square miles of the Sargasso Sea. Other groups are the red algæ (*Rhodophyceæ*), mostly seaweeds of delicate form, the unicellular motile diatoms (*Bacillariophyceæ*), and the blue-green algæ (*Cyanophyceæ*). All algæ possess unicellular reproductive organs. Various types of life cycle occur, the most complex being found in the red algæ.

Bryophyta.—These are the liverworts (*Hepaticæ*) and the mosses (*Musci*). They are all small plants characterised by a sharply defined life-cycle. This consists of an alternation of generations, the "plant" being a gametophyte bearing sex organs. The latter are multicellular, the female archegonium containing a single stationary ovum and the male antheridium producing many motile sperms. The latter are released and swim in water to the archegonium, where fertilisation takes place. After this a sporophyte is formed



which is always dependent on the gametophyte and never becomes free living. The sporophyte usually consists of an absorbing foot buried in the tissue of the gametophyte and a stalk or seta bearing at the top a single sporangium. In many mosses this is a complex structure with hygroscopic teeth which move apart only when dry, thus releasing the minute spores only when conditions are suitable for their dissemination in the air. The bryophytes are of little economic importance, and may be looked upon as an evolutionary sideline. However, they occupy suitable "niches" in many plant communities, and species of the bog-moss *Sphagnum* cover large areas where rainfall is high.

Psilopsida.—This is a small group of primitive, vascular, spore-bearing plants. Its only living representatives are two rare genera of the Southern Hemisphere. However, a number of fossil forms are known from the Devonian period. The best known are those found in the chert at Rhynie in Scotland. The plants are excellently preserved, and their internal structure can be easily seen. They were probably marsh plants with prostrate and erect leafless stems, although *Asteroxylon* had simple leaves.

Sphenopsida.—The only living members of this group are about twenty-five species of horsetails (*Equisetum*). In the Carboniferous period many tree forms existed (*e.g.*, *Calamites*), the remains of which are very common in coal deposits.

Lycopsida.—In the Carboniferous period the tree clubmosses were also prominent members of the forests (*e.g.*, *Lepidodendron*). They often reached 100 ft. in height, were branched or unbranched, and had large simple leaves. They also had extensive root systems. The only living members belong to a few genera of small herbaceous clubmosses, such as *Lycopodium* and *Selaginella*. Like the true mosses, they have an alternation of generations, but the elaborate plant with stem, leaves, and roots is the sporophyte, and the gametophyte is very small. In *Lycopodium* only one kind of spore is produced, and the resultant gametophyte is bisexual. *Selaginella* produces numerous small microspores which give rise to the very reduced male gametophytes and motile sperms and the few large megaspores which produce the female gametophytes. The latter are formed within the megaspore wall, which splits to allow the sperms to reach the small archegonia.

Filicinæ.—These are the true ferns, which in some classifications are put with the horsetails and clubmosses in the Pteridophyta or vascular cryptogams (*i.e.*, vascular plants without seeds). The ferns have a long fossil history, and remains very similar to the living Royal ferns (*Osmunda*) are known from the Carboniferous. The ferns are widespread and particularly abundant in tropical forests. The majority are herbaceous perennial plants, but a few are aquatic, and there are some tree ferns, which may reach 20 ft. in height. Most ferns possess a stem bearing roots and large leaves or fronds. The plant is the sporophyte and produces numerous spores in sporangia borne on the fronds. Each spore gives rise to a minute green free-living gametophyte known as the prothallus, which bears the archegonia and antheridia. After fertilisation a young sporophyte develops, which at first draws nourishment from the prothallus. Thus, as in the *Bryophyta*, external water is essential for the motile sperms to swim in, and there is a clearly defined alternation of generations, but the sporophyte is a complex independent plant, and the gametophyte is reduced though free-living.

Gymnospermæ.—These were the dominant land plants in the Mesozoic era, although fossil remains are found as far back as the Devonian. The living members still form large forests in the North Temperate regions. They are mostly tall evergreen trees with roots, stems, and small leaves. The conifers include the pines (*Pinus*), larches (*Larix*), and yews (*Taxus*). The cycads are a relic group of tropical plants with thick, unbranched trunks and large fern-like leaves. The maiden-hair tree of Japan (*Ginkgo biloba*) has also had a long geological history. Another interesting Gymnosperm is *Metasequoia*, a genus well known to palæobotanists. In 1948 a few living specimens were found in a remote area of China. Seeds were collected and plants are now being grown in botanical gardens all over the world. The Gymnosperms are characterised by the production of "naked" seeds, which are usually borne on cones. The male pollen grains, which are equivalent to the microspores of *Selaginella*, are carried by wind to the ovule of the female cone. The pollen germinates and the pollen tube carries the male gametes to the reduced archegonia borne on the female prothallus, which, unlike those of the ferns, is retained within the ovule on the parent plant. After fertilisation an embryo is formed, the prothallus becomes the food store or endosperm, and the outer part of the ovule becomes the seed coat. The cycads and *Ginkgo* retain a primitive feature in that the male gametes are motile and they swim to the archegonia from the pollen tube.

Angiospermæ.—The apparent sudden rise of the Angiosperms in the Cretaceous period is still the "abominable mystery" it was to Darwin. Various suggestions have been put forward, but nothing definite is known about the origin of the group. The Angiosperms or flowering plants are now the dominant group over most of the land surface of the earth, and at least 250,000 species are known. Apart from the natural vegetation, the majority of our crop and garden plants are Angiosperms. They occur in every type of habitat and range in form from gigantic trees to minute plants, such as the duck-weeds. Some are climbers, others succulents, and a number have reverted to the aquatic habit. Although most possess chlorophyll, a few are partial (*e.g.*, Mistletoe) or complete parasites (*e.g.*, Dodder).

Flower, Fruit and Seeds.—The diagnostic feature of the group is the production of seeds, which are completely enclosed within the female part of the flower, the ovary. Basically a flower is a short reproductive shoot which bears several whorls of lateral organs. At the base are several, often green, protective sepals forming the calyx, and above this are the often brightly coloured petals of the corolla. Within this are the stamens of the androecium or male part of the flower. Centrally is the female gynoecium of one or more carpels containing the ovules. The parts of the flower may be free, as in the buttercup, or fused together. In many species the petals are fused (sympetalous), the stamens are borne on the corolla (epipetalous), and the carpels are fused to form a compound gynoecium (syncarpous). The stamens possess anthers, which produce pollen grains. These are shed and carried by insects or wind to the receptive stigmas of the carpels. Each produces a tube which grows down the style to the ovary and enters an ovule. The ovule is a complex structure containing an ovum and a primary endosperm nucleus. Two male nuclei are discharged from the pollen tube, one fuses with the ovum and the other fuses with the primary endosperm nucleus. After this "double fertilisation" an embryo is formed which is embedded in the nutritive endosperm and the outer tissues of the ovule form the seed coat or testa. The ovary of the carpel develops into the fruit containing the seeds. Fruits are of various kinds, being either dehiscent and opening when mature to release the seeds or indehiscent, with a succulent or dry wall. The indehiscent fruits are shed as a whole, and often contain only a single seed. Seeds and fruits show great variation in structure, and often have adaptations assisting dispersal. Some have hairs or wings which aid wind dispersal, whereas others have hooks or are sticky and are transported by animals. Some have flotation devices and may be carried a great distance from the parent plant by water. Seeds vary in size from the microscopic seeds of orchids to those of the double coconut, which may weigh 40 lb. Only about 10% of the weight of a seed is water, and the embryo, although alive, is dormant. The bulk of

a seed consists of stored food material, commonly fats or starch and proteins, which may be contained in the endosperm surrounding the embryo, although in some species the endosperm is absorbed during seed development and the food is stored in the one or two swollen seed leaves or cotyledons of the embryo.

Classification of Flowering Plants.— John Ray (1627–1705) was the first botanist to recognise the two great divisions of the Angiosperms—the dicotyledons with two seed leaves and the monocotyledons with only one. This primary division of the flowering plants has stood the test of time and is still recognised. Other differences are also found between the two groups. The dicotyledons usually have net-veined leaves and the floral parts are in fours or fives, whereas the monocotyledons usually have leaves with parallel veins and the floral parts are in threes.

THE GEOLOGICAL RECORD.

London is an old city as cities go, although not so old as Rome, but geologically speaking it is not so long since the land upon which London stands was beneath the sea. Later in time there were tropical jungles on the banks of the Thames in which sabre-toothed tigers hunted their prey, the Thames was a tributary of the Rhine, and, still more recently (in fact only yesterday on the geological time-scale), the great Ice Ages brought sub-arctic conditions to our land.

The various stages in the history of the earth can be read by the geologists in the strata or layers of rock laid down since the planet began to solidify, and it is in these rocks, too, that the record of life upon earth may be traced.

No Life Rocks.—The earliest rocks in the record are known as the Azoic (no life) rocks, because they show no trace of living things, and these layers are of such thickness that they occupy more than half of the whole record That is to say, for more than half of the earth's history nothing living existed upon any part of the globe. For millions of years the surface of our planet was nothing but bare rock without soil or sand, swept by hot winds exceeding in violence the wildest tornadoes of today, and drenched by torrential downpours of tropical rain which, as we have seen elsewhere, gradually tore away the surface to form sandy sediments at the bottom of the seas. In such ancient rocks pushed above the surface by later upheavals we can still trace the marks of primeval oceans as they rippled upon the barren shores or of raindrops which left their imprint perhaps 1,500 million years ago.

Primitive Sea-life.—As we move upwards through the strata, however, traces of life begin to appear and steadily increase as we come to the more recent levels. The earliest signs appear in what is known as the Early Paleozoic Age (or by some writers as the Proterozoic Age), when we find the fossilised remains of small shellfish seaweeds, and trilobites—the latter were creatures somewhat like the plant-lice of modern times. All these primitive animals and plants lived in the shallow tidal waters of ancient seas; for as yet life had not invaded either the dry land or the deep oceans. It is, of course, clear that these creatures of Early Paleozoic times were not the first living things: they were merely the first creatures capable of leaving fossilised remains, and without doubt must have had more primitive ancestors—amoebic-like forms, jellyfish, bacteria, and so on whose bodies were too soft to leave any traces in the record of the rocks. This problem, however, will be discussed more fully later.

The Age of Fishes.—Towards the end of the Early Paleozoic Era, in what we now know as the Silurian period, there arose a new form of life: the first backboned animals, primitive fishes somewhat similar to the sharks of today; and in the division of the Upper Paleozoic Era known as the Devonian, they had come to multiply so greatly that this is frequently described as the Age of Fishes.

First Land Animals and Plants.—It is about this time, too, that we begin to find traces of animal and plant life upon the dry land. Both animals and plants had acute problems to solve before it became possible for them to live out of water; for both animals and plants had hitherto been supported by the surrounding water and respired by removing oxygen dissolved in the water. In land animals this problem was solved by a long series of adaptations from gills to lungs. Plants were able to invade the land because of the evolution of an impermeable outer cuticle which prevented water loss and also the development of woody tissues which provided support and a water-conducting system for the whole plant body.

Amphibia and Spore-bearing Trees.—The first type of vertebrates (backboned animals) to live upon dry land was the group of amphibia in the Carboniferous Age, which is today represented by the newts, frogs, toads, and salamanders. In all these forms the eggs give rise to a tadpole stage with gills which lives for some time entirely in water. Later the gills give place to a primitive form of lung which enables the animal to live upon land. Even so, amphibia are restricted

THE GEOLOGICAL TIME SCALE.

ERAS	PERIODS	AGE (millions of years)	LIFE
CAENOZOIC	Pleistocene	1	Man
	Pliocene		
	Miocene	25	Birds, Mammals and modern plants
	Oligocene		Molluscs
	Eocene	70	
MESOZOIC	Cretaceous	135	Dinosaurs, Cycads; Earliest Birds; Ammonites and Sea-urchins
	Jurassic	180	
	Triassic	225	
PALAEOZOIC	Permian	270	First mammals; Early reptiles
	Carboniferous	350	Amphibians, tree-ferns, first insect
	Devonian	400	Fishes, first land plants
	Silurian	440	Mainly invertebrate animals; n life on land. Trilobites an graptolites
	Ordovician	500	
	Cambrian	600	
PRE-CAMBRIAN (also PROTEROZOIC, ARCHAEOZOIC)		2,000	Life emerges
		5,000	Age of Earth

more or less to swampy or marshy land, and without a damp environment they would dry up and shrivel to death. The most abundant forms of plant life in the Carboniferous period were the tree-like horsetails, clubmosses, and ferns, the fossilised tissues of which are found in the coal measures and are burned as household coal. But these plants also, as in the case of the amphibia, could exist only amongst the swamps and marshes, and life, although it had freed itself from the necessity of existence in the waters of the earth, still had to return to the water in order to reproduce itself. The highlands and the deeper waters of the planet were still empty of living things. Although the Carboniferous period had been a period of warmth and abundance, the Paleozoic Era came to an end with a long cycle of dry and bitterly cold ages. Such long-term climatic changes were due, it is now supposed, to such factors as changes in the earth's orbit, the shifting of its axis of rotation, changes in the shape of the land masses, and so on. Long before the Ice Ages of more recent times, there are records in the rocks of alternating periods of warmth and cold as far back as the Azoic and Early Paleozoic Eras. This long cold spell at the close of the Paleozoic era came to an end about 220 million years ago, and was succeeded by a long era of widely spread warm conditions—the Mesozoic Era, the so-called Age of Reptiles.

The Mesozoic Era.—The reptiles first appeared in the Permian, but it was during the Mesozoic era that they became the dominant group of animals. The giant reptiles included the stegosaurus, the gigantosaurus, the diplodocus, and many other kinds which were far larger than any land animals living today. Some, for example the diplodocus, were 100 ft. long, although they were vegetarian in habit and were preyed upon by other almost equally huge flesh-eating reptiles. Some species, such as the plesiosaurs and icthyosaurs, became secondarily aquatic, while the pterodactyl possessed wings with which it could glide and perhaps fly short distances. However, they all differed from the amphibia in that they had hard, dry skins, their lungs were more efficient, fertilisation was internal due to the development of copulatory organs, and they laid eggs with hard, protective shells.

It was also during the Mesozoic era that the warm-blooded birds arose. The birds, like the reptiles, lay eggs with hard shells, and they have several internal features found in the reptiles. The fossil bird Archæopteryx, three specimens of which have been found in Germany, lived in the Jurassic period. Although it was obviously a bird, it retained many reptilian features. Earliest mammals are recognised in rocks of the late Palaeozoic but in the Mesozoic considerable evolution of the group took place. The fossil Tri-tuberculata which are also found in the Jurassic, are believed to be related to forms from which both the marsupial and placental mammals arose. Although insects were present as far back as the Carboniferous, it was in the Mesozoic that many of the groups we know today first appeared.

Great changes also took place in the plant cover of the land during this era. The spore-bearing giant horsetails and tree clubmosses declined and were replaced by gymnosperms—trees bearing naked seeds. One large group of these, the cycadeoids, has become extinct, but the conifers and a few of the once abundant cycads still remain. The flowering plants or angiosperms also made their appearance, and towards the end of the Cretaceous their evolution was extremely rapid. In fact, many of the fossil leaves found in rocks of Cretaceous age are indistinguishable from those of some present-day flowering plants.

A New Era.—But, perhaps 150 million years later, all this seemingly everlasting warmth and sunshine, the lush tropical life, the giant reptiles who had ruled the world, were wiped out by a new period of bitter cold which only the hardy species could survive. A new Era known as the Caenozoic was beginning, ushered in by a period of upheaval and volcanic activity, following which the map of the world came to resemble more closely the picture we know today. The cold period may have lasted several million years, and the main species to survive it were those which had come into existence towards the end of the Mesozoic Era, the seed-bearing flowering plants, the birds, and the mammals. The once all-powerful reptiles from this time onwards are represented only by the comparatively few and relatively small reptilian species of today: the snakes, lizards, crocodiles, and alligators. It was at this time, too, that, long after the creation of the mountains of Scotland and Norway (the so-called Caledonian revolution), or even of the Appalachian mountains (the Appalachian revolution), there arose the great masses of the Alps, the Himalayas, the Rocky Mountains, and the Andes. These are the mountain chains of the most recent, the Caenozoic revolution. Initially, as we have seen, the climate of the Caenozoic Era was cold, but the weather grew generally warmer until a new period of abundance was reached, only to be followed at the end of the Pliocene by a period of glacial ages generally known as the First, Second, Third, and Fourth Ice Ages.

The Great Ice Age.—The latter was separated by interglacial periods when the climate was milder—we are, in fact, living at the moment at the end of the last Ice Age, for the retreat of ice from Europe began only about 25,000 years ago. It must be remembered, however, that even at the height of the Glacial periods the ice never extended over the whole face of the earth: it was, indeed, limited to an area which never moved farther south than what is now Northern Germany, Northern France, the larger part of the British Isles, small areas in the North of Asia, and about half of the North American continent.

THE EVOLUTION OF ORGANISMS.

Introduction.—It is commonly thought that the great 19th cent. naturalist Charles Darwin was the first person to suggest that life had continually evolved. However, the idea that species of living organisms could change over long periods of time was considered by some Greek writers and, much later, by the Frenchmen Buffon and Lamarck at the end of the 18th cent. Further, the work of the 18th cent. geologists such as James Hutton and William Smith provided a basis without which Darwin's contribution would have been impossible. Hutton showed that the earth's surface had undergone prolonged upheavals and volcanic eruptions with consequent changes in sea level. This implied that the earth was much older than had previously been supposed. Smith developed a method of dating the geological strata by means of the fossils found in them and demonstrated that widely different types of animals and plants existed at different periods of the earth's history. As described in the previous section a general picture is presented of the evolution of organisms from the simple to the complex and from the aquatic to the terrestrial environment. These discoveries were in conflict with the Biblical account in the book of Genesis and, although various attempts were made to explain them away or discredit them, it became abundantly clear that through millions of years life has been continually changing, with new species constantly arising and many dying out. Before considering Darwin's major contribution to the theory of evolution it will be appropriate to outline briefly the various lines of evidence which indicate that, in fact, evolution has taken place.

The Evidence for Evolution.—

1. *The Geological Record.*—It has already been pointed out that successively younger rocks contain fossil remains of different and relatively more complex organisms. The spore-bearing plants preceded the gymnosperms and the angiosperms arose much later. Similarly in the vertebrate series the fish appeared before the amphibia which were followed by the reptiles and later by the air breathing, warm-blooded birds and mammals. On a more restricted level the rocks provide even greater support for the occurrence of evolution. For example, the evolution of the horse has been worked out in great detail from the small Eohippus

which was about a foot high and had four digits on the forefeet and three on the hind feet to the large one-toed animal living today. However, such complete series are rare and the geological record is very incomplete. There are a number of gaps, particularly between the major groups of organisms. No satisfactory fossil evidence is known of the ancestors of the angiosperms (F33) and although some may be discovered it could be that they did not grow in conditions which favoured their preservation as fossils. On the other hand, Archaeopteryx provides an indisputable link between the reptiles and the birds.

Another important point should also be made about the geological record. Although we talk about the age of fishes, the age of reptiles and so on it must be emphasised that these are the periods during which particular groups were abundant or even dominant. Each group probably originated many millions of years before it became widespread. Further, some groups, such as the giant reptiles and the seed-ferns, died out completely whereas others, the fishes and true ferns for example, are still common today. However, even in the latter groups there is evidence that they have continued to evolve so that many fishes and ferns that exist today are very different from those of the Devonian and Carboniferous periods (F34). On the other hand, the geological record also shows that some species, for example the Maiden-hair tree, have remained unaltered for many millions of years.

2. *Geographical Distribution*.—Nearly all the marsupials or pouched mammals are found in the Australian continent which was cut off from the mainland about 60 million years ago. All the fossil evidence indicates that at that time the eutherian or placental mammals did not yet exist. The marsupials are the only naturally occurring mammals in Australia (F26(2)) but since the isolation of the continent the group has given rise to a large number of species very similar in appearance to those which evolved elsewhere in the world among the eutherian mammals. There are marsupials which look like wolves, dogs, cats and squirrels; yet they have no close biological relationships to these animals. Further, some marsupials such as the kangaroos have evolved which are unlike any other creatures in the rest of the world. Quite clearly the isolation of Australia so long ago has resulted in the evolution of these distinct types. A similar small-scale effect of isolation was studied by Darwin in the Galapagos islands where each has its own distinct flora and fauna which differ also from those of the S. American mainland.

3. *Anatomy*.—The comparative study of the development and mature structure of the mammalian body provides much evidence that all the species have evolved from a single ancestral stock. Although the arm of an ape, the leg of a dog, the flipper of a whale and the wing of a bat appear very different externally they are all built on the same skeletal plan. It would be difficult to explain such similarities unless they had all evolved from a common type. There is also evidence that the early development of an animal recapitulates its biological history to a certain extent. For example, the gill slits found in fish are formed during the early stages in the development of a mammal although later they disappear. Finally, apparently useless vestigial structures sometimes occur which would be inexplicable unless regarded in the light of an evolutionary history. In man a small appendix and vestiges of a third eyelid occur but these are functionless although in other animals such structures are well developed and functional, *e.g.*, the appendix in the rabbit.

4. *Human Selection*.—During his brief history on earth modern man has continually selected and bred animals and plants for his own use. We have only to look at the various breeds of dogs which have been developed from a single wild type to see that under certain circumstances great structural divergence can occur in a species even in a relatively short time.

The Darwinian Theory of Evolution.—Darwin amassed a great deal of information such as that outlined above which convinced him that evolution of life had taken place over millions of years. His was the first real attempt to collect all the evidence scientifically and no other satisfactory alternative explanation of all the facts he presented has been proposed. Perhaps even more important was his attempt to explain *how* evolution had actually occurred. He published his theory after many years of work in his book *The Origin of Species by Means of Natural Selection* in 1859. Some of his ideas have since been modified owing to our increased knowledge of genetics but they are so important that it is worth while recounting the main points of his theory.

1. *The Struggle for Existence*.—It is clear that in nature there is a severe struggle for existence in all animals and plants. Over a period of time the number of individuals of a species in a given community does not vary greatly. This implies that the number of progeny which survive to become mature breeding individuals more or less replaces the number of mature ones that die. Generally speaking the reproductive output of a species is much greater than this. For example, a single large foxglove plant may produce half a million seeds each one of which is potentially capable of giving rise to a new individual. Obviously nearly all the progeny die before reaching maturity and the chance of any single one surviving is very remote.

2. *Variation*.—The individuals of any generation of human beings obviously differ from one another and such differences are found in other organisms. No two animals of the same species (except perhaps for identical twins) are exactly alike and when a large number of individuals are examined it is clear that they vary considerably in structure, colour, activity and so on. Darwin also pointed out that generally these variations were passed on from one generation to the next, for example, the children of tall parents tend to grow tall.

3. *Survival of the Fittest*.—If there is an intense struggle for existence in their natural environment among individuals of a species having different characteristics, those which are best "fitted" to a given set of conditions are most likely to survive to maturity. These will reproduce and the features which enabled them to survive will be passed on to their offspring. This process is liable to continue and a species will become better adapted to its environment.

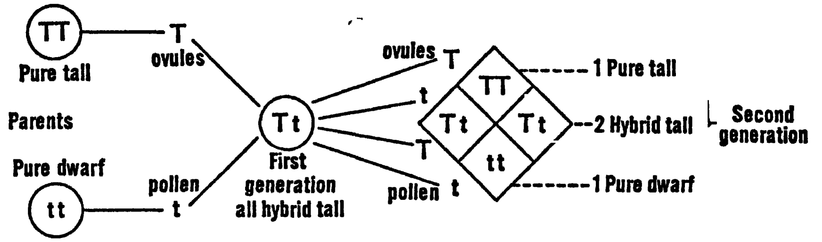
4. *Natural Selection*.—Over a long period of time the environment of a given species is never stable but will change in various ways. As it does so the characters which best fit the individuals to the changed environment will be selected (not consciously of course) and the species will change. The environment may change only in part of the range of the species and thus lead to divergence and the production of a new species alongside the old one.

Darwin and Lamarck.—Darwin pictured evolution as a slow continuous process with natural selection operating on the small inheritable variations found between the individuals of a species which are undergoing intense competition. This neglects the important effect of the environment on the growth and structure of the individual. It is obvious that external conditions will affect the development of an organism, for example the effect of various soil conditions on the growth of a plant or the amount of food material available to an animal. Lamarck maintained that the characters acquired by an individual owing to the effect of its environment could be passed on to its offspring. Undoubtedly characters are acquired by the individual during its growth but in spite of many attempts to prove otherwise no experiments have been done which prove conclusively that these are inherited by the offspring. Thus Lamarck's theory that evolution has occurred by the inheritance of acquired characters is not generally acceptable today.

Mutation Theory.—The data accumulated by Darwin showed that the variations between ind

viduals of a species are small and graded into one another. If a particular character in a group of individuals is measured it is found that it varies symmetrically about a mean or average, with most values clustered about the mean and with few extreme ones. Darwin himself was worried about this fact because, although selection over a long period of time might shift the position of the mean, he did not see how it could bring about the discontinuity necessary for the establishment of a distinct new species. De Vries in his *Mutation Theory* published in 1901 put forward the view that evolution depends, not on the accumulation of continuous minute variations, but primarily upon large discontinuous variations or mutations. The importance of such spontaneous "sports" was considered by Darwin but he rejected the idea because when they appear they are usually "monstrous". Such individuals are less "fitted" to their environment and therefore they will not survive to reproduce and give rise to a new species. That mutations are important factors in evolution is undoubtedly true but modern work has shown that the whole problem is far more complex than either Darwin or De Vries supposed.

Mendelism.—It is remarkable that in spite of carrying out many careful experiments on inheritance in plants Darwin did not discover the simple laws which are the basis of modern genetics. Mendel investigated inheritance in the garden pea and published his results in 1865, *i.e.*, at the time that Darwin's work was being widely discussed. However, Mendel's important discoveries were not generally known until 1900. When he crossed a pure breeding tall plant with a pure breeding dwarf plant all the progeny were tall. When these plants were self-pollinated the next generation consisted of approximately one quarter dwarf plants and three quarters tall. From this and similar experiments Mendel deduced that the "factors" passed from parents to offspring were paired, only one of the pair came from each parent and that one could be dominant over the other. When he dealt with two pairs of characters, *e.g.*, tall or dwarf plants and round or wrinkled seeds, he found that they segregated and recombined independently and in predictable ratios.



The importance of Mendel's work in relation to evolution is that it showed that there was no blending of the characters in the offspring. Mutations can be hidden as recessive characters in a population and are not diluted or lost. Although they may not be of importance when they first appear they may be so if the selection pressure changes and they become of survival value. Thus specific characters may change or diverge and evolution will take place. His investigations also showed that recombination of factors could give rise to plants with new characteristics. By crossing a pure bred tall plant having round seeds with a dwarf plant having wrinkled seeds he produced in the second generation some tall plants with wrinkled seeds and dwarf plants with round seeds. When a large number of characters are involved it is obvious that considerable variation and recombination occurs upon which natural selection can work.

Mendel was fortunate in his choice of experimental material with its easily recognisable contrasting characters. It is now known that his "factors" are the genes carried by the chromosomes in the nucleus of the cell. At the present time the biochemical basis of heredity is being vigorously investigated. *See* F24.

THE ORIGIN OF LIFE.

We have seen in the previous two sections that life has existed on earth for many millions of years and that it has continuously changed or evolved. This raises the obvious question of the origin of life on earth. There are three possible explanations: (*a*) that it was supernaturally created; (*b*) that living organisms arrived from some other part of the universe; or (*c*) that it arose by natural processes from inorganic matter. The first explanation is not strictly scientific, *i.e.*, it does not elucidate observations in terms of natural laws. The second possibility, if true, only pushes the problem one stage farther back. It would also require an explanation of how living organisms could survive the hazardous journey through space. There remains the third suggestion that life arose on the earth at an early stage in its long history. This view is accepted by most scientists today, and N. W. Pirie has proposed the convenient term *biopoesis* (life-making) for the origin of life. The approaches to the problem until recently have been mainly speculative, but modern molecular biology is pointing the way towards an understanding of the origin of life. People who are interested in this subject will find J. D. Bernal's *The Origin of Life* (1967) very informative.

Chemical Conditions before Life appeared.—The earliest fossil remains found in the rocks are of relatively complex organisms. Undoubtedly life first appeared much earlier than the time when these organisms existed, and in a much simpler form. J. D. Bernal has pointed out that biopoesis involved development from the simple to the complex and that Darwin's concept of evolution has to be projected backwards to include the chemical evolution of non-living and pre-vital substances. All living things are built up from organic compounds which contain the element carbon. These compounds are extremely complex, and a single molecule of a protein may contain many hundreds of atoms. Proteins, which are the structural basis of protoplasm, consist of many simpler amino-acids linked together. Thus, before considering the formation of the complex organic compounds found in living organisms, the formation of the simplest organic substances, such as hydrocarbons, must be dealt with. Presumably at an early stage in the earth's history there were land masses, seas and rivers, an atmosphere, but no life or complex organic compounds. It seems likely that the atmosphere consisted of a mixture of nitrogen, carbon dioxide, hydrogen, ammonia, and methane, but probably no oxygen was present. Therefore the conditions on earth when life first arose were probably very different from those today, and A. Oparin and J. B. S. Haldane concluded that these favoured the formation of energy-giving organic molecules. Recent experiments in Russia and America have shown that if mixtures of the gases mentioned above are exposed to electrical discharges or ultra-violet light many organic molecules are formed, including those of amino-acids. This suggests a way in which simple organic compounds may first have been formed on earth, as its atmosphere would have been exposed to both electrical discharges (lightning) and ultra-violet light (from the sun).

From Simple to Complex Molecules.—A further step would involve the formation of sub-vital systems which, using this energy, could grow, split, and reproduce themselves. Haldane suggested that these may have been complex phosphates, but J. W. S. Pringle believes that they were oxidised hydrocarbons. The maintenance of these sub-vital systems poses two problems, their protection from the turbulence of their environment and an adequate concentration of their constituents. According to Pringle, they existed in the depths of the oceans, but Haldane suggested they occurred in water-logged soils. Bernal considers they may have been adsorbed on to certain clays along shores and estuaries where the clay minerals might also have acted as inorganic chemical catalysts and promoted the building of larger molecules. Pirie has made the important point that probably many sub-vital systems were formed over a long period of time and that life on earth today represents only one or a few of the most successful.

The Need for More Research.—Another crucial step would be the development of a cell membrane which would contain and protect the system within but which would allow the interchange of substances between the system and the environment. No useful hypothesis has been suggested for this, although Haldane put forward the view that this was a highly improbable event which occurred once to form the first cell.

Obviously we are far from having an answer to this intriguing problem, which has become of even greater importance with the beginning of space exploration and the possibility of finding life on other planets. It is one which can be fully answered only by the joint efforts of scientists of many disciplines, astronomers, biologists, chemists, and physicists.

III. THE ORIGINS OF HUMAN SOCIETY

THE EARLIEST MEN.

Before describing the earliest men, it is important to try and define just what is meant by "Man." Man is a member of the Order of Primates and of the Sub-Order Anthropoidea, which includes also apes and monkeys. Both Man and the apes belong to the Super-Family Hominoidea, which is subdivided into two Families: the Pongidae or anthropoid apes; and the Hominidae, which includes all extinct and modern forms of Man. The most important anatomical difference between the two Families is that hominids walk upright, whereas pongids are dependent also on their arms for locomotion.

The common ancestral stock of these two Families may be represented by certain fossil forms found in East Africa, which lived during the Miocene period about 20 million years ago; some of these early apes show characteristics of the hominid line which are not found in the great apes of today. The modern apes have specialised for life in the trees, but some of their ancestors must have left the forests and taken to life on the open plains. In this new environment, the arms no longer had to be used for swinging from tree to tree and gradually the pelvic girdle and lower limbs became adapted to an erect posture. This development had far-reaching effects: it meant that the hands were now free for tool-using and tool-making.

The Australopithecines.—The earliest known hominids are the Australopithecines of E. and S. Africa which lived over a million years ago, during the later part of the Lower Pleistocene. They are so ape-like in appearance that for many years scientists disputed that they were hominids rather than pongids. But, although they cannot be regarded as "men" in the sense that we speak of all members of the genus *Homo* as men, the shape of their pelvis and limb bones makes it certain that they had adopted the erect posture, and for this reason they are classified as hominids.

The first *Australopithecus*—a name which means "southern ape"—was found in 1924 at Taung, Bechuanaland, by Professor R. Dart; it was the skull of a child, and therefore its true position in the evolutionary scheme could not be assessed with certainty. From 1936 onwards, however, adult remains of similar creatures were found by the late Dr. R. Broom in the limestone caves of the Transvaal. These fossils were given various names, but it is now generally agreed that they are all members of one genus. Probably two species are represented: one is small and unspecialised, the other larger and more like the modern gorilla. Both had small brains, but when their size is taken into consideration the brain is relatively larger than that of modern apes.

Occasional finds of crude stone tools in the South African caves suggested that the Australopithecines might have been tool-makers. This view seemed to be supported by a discovery in East Africa in 1959. In the lowest bed of Olduvai Gorge, Tanganyika, Dr. and Mrs. Leakey found a skull which is similar to the more ape-like of the two Australopithecine species from South Africa. Known as *Australopithecus* (*Zinjanthropus*) *boisei*, it was dated by the potassium-argon method to about 1,700,000 years. It has a huge palate with enormous molars, hence its popular name "Nutcracker Man." Also at Olduvai were remains of a more advanced hominid which in 1964 was named *Homo habilis*. It seems to be transitional between the Australopithecines and *Homo erectus* and there seems little doubt that it was this hominid that made the stone tools found in abundance in Bed I and the lower part of Bed II.

This "pebble culture", the Oldowan, is known from many parts of Africa. It is the first stage of the Palaeolithic or Old Stone Age, which persisted from over a million years ago until the end of the Ice Age about 8000 B.C.

Homo erectus.—The second stage in the evolution of the hominids is represented by *Homo erectus*, or *Pithecanthropus*, as he was formerly called. His remains have been found in Java, China, and Africa, in deposits dating from the Middle Pleistocene, about 400,000 years ago. The brain was considerably larger than it had been during the Australopithecine stage, but it was still very small compared with that of modern man. The skull is extremely thick, the forehead low and sloping, the brow-ridges very heavy, and the chin region receding. The first skull of *Pithecanthropus erectus*—"erect ape-man"—was found as long ago as 1891 at Trinil, Java, by Dr. E. Dubois. Other specimens were discovered by Dr. G. H. R. von Koenigswald during the 1930s, including a rather earlier form named *P. robustus* and a massive jaw of *Meganthropus* which probably represents the Australopithecine stage in Java.

The first remains of Pekin Man from the cave of Chou Kou Tien near Pekin were discovered in 1927 and 1929. Named *Sinanthropus pekinensis*, these specimens are now accepted as being a sub-species of *Homo erectus*. A sad fate befell the original material: it was all lost in American hands during the war as it was being evacuated from China. There are casts of the originals, however and more pieces of mandible have been found since 1959. Pekin Man was accompanied by crude tools of stone and bone and hearths show that he could make fire. Large accumulations of bone prove that he was a skilful hunter and human skulls smashed to extract the marrow indicate that he was also a cannibal.

The only certain representatives of *Homo erectus* outside Asia consist of a skull from Bed II, Olduvai Gorge, and jaws found in Algeria and Morocco in 1954–5. The latter were named *Atlanthropus*, but are almost identical with jaws of Pekin Man. They were accompanied by Acheulian hand-axes, pear-shaped tools which persisted with very little change from the end of the pebble-culture for about 200,000 years. The Olduvai skull, found in 1960, was also associated

with hand-axes. It has been dated by the potassium-argon method to about 490,000 years.

The earliest human remains from Europe consists of an isolated jaw found at Mauer, near Heidelberg in Germany in 1907. It is extremely massive and has a number of features which distinguish it from *Homo erectus*. In 1964 and 1965 some teeth and parts of a skull were found at Vertesszöllös in Hungary which may be equally ancient. Both are thought to be roughly contemporary with Pekin Man.

These remains date from the second of the four glacial advances which followed one another during the Pleistocene period. In northern Europe and North America deposits from these successive glacials and interglacials provide a means of dating fossils and implements found in them. Two human skulls dating from the Second or Great Interglacial, about 250,000 years ago, are known from Europe: from Steinheim in Germany and from Swanscombe in Kent. These are roughly contemporary with the last survivors of *Homo erectus* in North Africa. Like the latter, Swanscombe Man was associated with hand-axes.

In the Steinheim brain-case we have, for the first time, proportions not very much smaller than those of modern man. The forehead, however, is sloping and there are well-marked brow-ridges. Probably both the Steinheim skull and the fragmentary Swanscombe remains are ancestral both to modern man and the Neandertal people.

The Neandertaloids.—During the early part of the Fourth Glaciation, in Upper Pleistocene times, the Neandertal race occupied parts of Europe, western and central Asia, and North Africa. At the same time rather similar people lived in southern Africa (Rhodesian Man) and Java (Solo Man). In Europe the Neandertalers lived in caves to protect themselves from the cold. They also buried their dead in caves, with the result that many of their skeletons have been preserved. The first Neandertal remains were found before the end of the last century, in the Neander valley in Germany, as well as in Gibraltar, Belgium, and Jugoslavia. Then many others were discovered in France, and now they are known also from central Siberia and from Cyrenaica and Morocco in North Africa.

The so-called "classic" Neandertalers had a rather brutal appearance, with heavy brow-ridges, sloping foreheads, and receding chins. At Mount Carmel in Palestine these exaggerated forms were found in the Tabun cave, while close by, at Skhul, were others with features far nearer to the men of today. This may be a case of individual variation within a group, or it may mean that Neandertalers interbred with people of modern type to produce hybrids.

Rhodesian Man, though clearly not a Neandertaler, has many distinctive features which distinguish him from modern man, particularly the enormous brow-ridges which form a continuous bar above the eye sockets. The first skull of this type was found in 1921 at Broken Hill in Northern Rhodesia; in 1951, a very similar skull was discovered near Saldanha Bay in Cape Province. The associated fauna and stone tools make it probable that these human remains date from the early part of the Upper Pleistocene, not more than 50,000 years ago and perhaps less. Contemporary and rather similar in appearance is Solo Man from Java, probably a direct descendant of *Homo erectus*, whose remains were found a few miles away.

Homo sapiens.—Events during the Fourth or Last Glaciation can be dated fairly exactly by the radiocarbon method, which, by means of new techniques, can now provide absolute dates over the past 50,000 years. Such dates have supported chronologies previously obtained by studying the geological deposits, which indicate three main cold phases separated by milder periods. Neandertal Man became extinct soon after the first cold phase ended about 40,000 B.C. and was replaced by *Homo sapiens* of completely modern appearance by the beginning of the second cold phase about 30,000 B.C.

Neandertal Man's stone tools were made on flakes; they consisted of points and other weapons which were probably hafted as spears. The implements made by the men who succeeded him show significant advances; they include small knife-blades and engraving tools, specialised for different purposes. It was during this Upper Palaeolithic stage that Man began to concern himself with something more than merely hunting and searching for food. He produced very fine paintings and sculpture, adorned himself with necklaces and other ornaments, and apparently practised magic rites and ceremonies.

Europe.—The earliest known skull of completely modern type comes from Combe Capelle in south central France and was associated with an industry which represents the first stage of the Upper Palaeolithic of western Europe. The somewhat later Cro-Magnon people, named from a rock shelter at Les Eyzies in the Dordogne, are associated with a culture known as Aurignacian, which is believed to have originated somewhere in the Middle East, perhaps in the region of Palestine. These people were rather tall, with long heads, very large brain-cases, and short, broad faces. They were responsible for very fine cave paintings depicting the animals they hunted, such as the mammoth, woolly rhinoceros, and reindeer.

Africa.—From their original homeland, these people spread westwards not only over Europe but also along the southern shores of the Mediterranean through North Africa. In East Africa too skeletons which are typical of the Mediterranean race have been found associated with an industry not unlike the Aurignacian of Western Europe but considerably later in time. Curiously enough, no skeletons showing characteristic Negroid traits have been found in Africa before post-Pleistocene times, about 8000 B.C., which suggests that the Negroid stock evolved relatively late. In southern Africa there were in Upper Pleistocene times people with very large brain-cases and yet with features reminiscent of the present Bushmen and Hottentots; the first skull of this type, from Boskop in the Transvaal, was found as long ago as 1913.
